All Rights Reserved.**

Attention please!

The information herein is given to describe certain components and shall not be considered as warranted characteristics.

Terms of delivery and rights to technical change reserved.

We hereby disclaim any and all warranties, including but not limited to warranties of non-infringement, regarding circuits, descriptions and charts stated herein.

Infineon Technologies is an approved CECC manufacturer.

Information

For further information on technology, delivery terms and conditions and prices please contact your nearest Infineon Technologies Office in Germany or our Infineon Technologies Representatives worldwide (see address list).

Warnings

Due to technical requirements components may contain dangerous substances. For information on the types in question please contact your nearest Infineon Technologies Office.

Infineon Technologies Components may only be used in life-support devices or systems with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system, or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body, or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.

TC1910

32-Bit Single-Chip Microcontroller

Microcontrollers

Never stop thinking.

PRELIMINARY

TC1910 Features

The TC1910 offers a 32 bit TriCore based microcontroller/DSP, which is mainly designed for automotive telematics applications. Due to its high integration, this microcontroller/DSP offers high system performance at minimized cost. Typical telematics functions processed by RISC-, DSP- and speech- (CODEC) modules are now combined in one component. This combination of dedicated speech peripherals (CODEC) and standard peripherals (SSC/SPI, ASC and IIC), makes this microcontroller/DSP the engine tailored for a wide variety of telematics applications such as navigation, emergency call, speech interface or communication interface.

- TriCore CPU/DSP with 4-Stage Pipeline:
 - 66 MHz max. CPU clock frequency, 50 MHz max. FPI Bus clock frequency.
 - 32-bit super-scalar TriCore main CPU
 - 4-GByte unified memory space support
 - Fast context-switching
 - Dual 16 x 16 Multiply-accumulate (MAC) unit
 - 64-bit Local Memory Bus (LMB)
 - 32-bit Flexible Peripheral Interface Bus (FPI)
 - 32-bit wide External Bus Unit (EBU)
- On-chip memories:
 - 24 KByte Code Scratch-Pad RAM (CSRAM)
 - 8 KByte Instruction Cache (ICACHE)
 - 24 KByte Data Scratch-Pad RAM (DSRAM)
 - 8 KByte Data Cache (DCACHE)
 - 64 KByte fast LMB SRAM
 - 16 KByte FPI SRAM (of which 8 KByte Stand-By SRAM)
- Product Specific Peripherals:
 - 14-bit double CODEC with flexible sample rates and FIFO support
 - 8 External Interrupt Inputs
- Standard Peripherals:
 - 2 x asynchronous serial interface (ASC) with IrDa-support
 - 1 SPI-compatible synchronous serial interface
 - IIC module
 - 3 x 32 bit timer
- General Peripherals:
 - Real time clock (RTC)
 - Watchdog timer (WDT)
- Clock Generation Unit with PLL
- Debug Support: OCDS Level 1 with JTAG interface
- Dual voltage supply (1.8V core, 3.3V I/O)
- Power saving features
- -40°C to +85°C temperature range
- LBGA-208 package

PRELIMINARY

Block Diagram.

Figure 1 TC1910 Device Block Diagram

Target applications

- Bluetooth gateway (host for BT stack e.g. for Handsfree with EC/NR or remote diagnostics)
- Stand-alone speech Human Machine Interface
- Basic communication gateway
- Digital Audio processing (MP3 player, shock proof controller etc.)

PRELIMINARY

System Architecture and Control

32-Bit TriCore CPU

- 32-bit architecture with 4-GByte unified data, program and input/output address space
- Fast automatic context-switch
- Dual 16 x 16 Multiply-accumulate (MAC) unit
- Saturating integer arithmetic
- Register based design with multiple variable register banks
- Bit handling
- Packed data operations
- Zero overhead loop
- Precise exceptions
- Flexible power management

Instruction Set with High Efficiency:

- 16/32-bit instructions for reduced code size
- Little endian byte ordering with support for big and little endian byte ordering at bus interface
- Boolean, array of bits, character, signed and unsigned integer, integer with saturation, signed fraction, double word integers and IEEE-754 single precision floating-point data types
- Bit, 8-bit byte, 16-bit half word, 32-bit word and 64-bit double word data formats
- Powerful instruction set
- Flexible and efficient addressing mode for high code density

PRELIMINARY

On-chip Code Memories

Local Memory Bus Memory (LMBRAM):

Address range of the 64 KByte Local Memory Bus Memory:

- C000 0000_H - C000 FFFF_H (in segment 12 for cached operation)
- E800 0000_H - E800 FFFF_H (in segment 14 for non-cached operation)

PMU Scratch-Pad SRAM (CSRAM):

The Program Memory Unit (PMU) memory consists of 24-KByte Code Scratchpad RAM (CSRAM) and 8-KByte Instruction Cache (ICACHE).

Address range of the CSRAM:

- D400 0000_H - D400 5FFF_H

On-chip Data Memories

DMU Scratch-Pad SRAM (DSRAM):

The Data Memory Unit (DMU) memory consists of 24-KByte Data Scratchpad RAM (DSRAM) and 8-KByte Data Cache (DCACHE).

Address range of the DSRAM:

- D000 0000_H - D000 5FFF_H

FPI-Bus Data Memory (FPIDRAM):

The FPI-Bus Data Memory (FPIDRAM) is a 16-KByte static RAM located on the FPI-Bus. It contains two parts: FPIDRAM0 and FPIDRAM1. One half of it (FPIDRAM1) can be used for standby power operation.

Address range of the FPI Data Memory:

- 9FFF 8000_H - 9FFF BFFF_H (in segment 9 for cached operation)
- BFFF 8000_H - BFFF BFFF_H (in segment 11 for non-cached operation)

PRELIMINARY

System Control Unit (SCU)

The System Control Unit of the TC1910 basically handles all system control tasks. All these system functions are tightly coupled and therefore they are handled physically by one unit, the SCU. The system tasks of the SCU are:

- Clock Generation and Control
- Reset control
- Power Management control and wake-up
- Watchdog timer
- Device identification
- Standby SRAM control
- External interrupt capability (8 sources)

System timer (STM)

The System Timer is designed for global system timing applications requiring both high precision and long range. It is used by the CPU for software operating system issues.

Features:

- Free-running 56-bit counter
- All 56 bits can be read synchronously
- Different 32-bit portions of the 56-bit counter can be read synchronously
- Driven by clock, f_{STM} (normally identical with the system clock).
- Counting begins at power-on reset
- Continuous operation is not affected by any reset condition except power-on reset

External Bus Interface (EBU_LMB)

EBU_LMB is connected to the Local Memory Bus (LMB) of the TC1910 and also to the FPI Bus. EBU_LMB is always a slave on the LMB and a master/slave on the FPI bus.

Any LMB masters thus can access external memories or devices through EBU_LMB. Currently the maximum length of the bursts are according to the size of program and data cache lines, i.e. 8 x 32-bit words. Single transfers (non-burst) are supported for 8-bit, 16-bit and 32-bit wide access.

PRELIMINARY

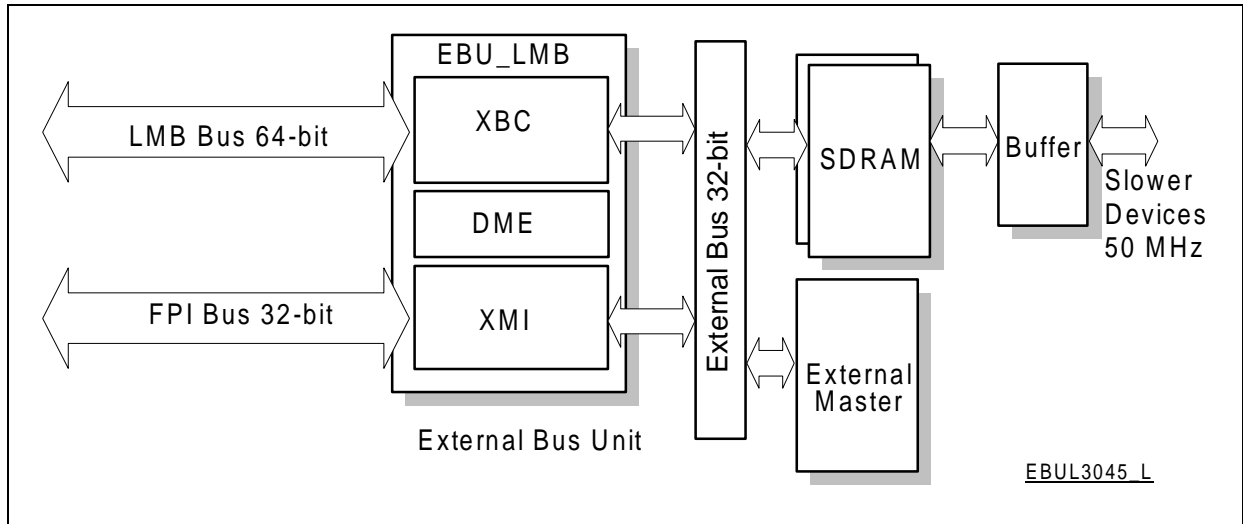

Figure 4 EBU_LMB block diagram

Features supported in EBU_LMB:

- Local Memory Bus (LMB 64-bit) support.
- External bus frequency: LMB frequency = 1:1 or 1:2 or 1:4.
- Highly programmable access parameters.
- Intel-style and Motorola-style peripheral/device support.
- SDRAM support (burst access, multibanking, precharge, refresh).
- 16- and 32-bit SDRAM data bus and support of 64, 128 and 256MBit devices.
- Burst flash support.
- Multiplexed access (address & data on the same bus) when DRAM is not present on the External Bus.
- Data Buffering: Code Prefetch Buffer, Read/Write Buffer.
- External master arbitration (compatible to C166 and other TriCore devices).
- 8 programmable address regions (1 dedicated for emulator).
- Little-Endian and Big-Endian support.
- \overline{CS}_{glb} signal, dedicated pin, bit programmable to combine one or more \overline{CS} lines, for buffer control.
- \overline{RMW} signal reflecting a read-modify-write action.
- Signal for controlling data flow of slow-memory buffer.
- Slave unit for external (off-chip) master to access devices on the FPI bus.
- Master unit for FPI master to access external (off-chip) devices.
- Data Mover Engine.

PRELIMINARY

Interrupt System

- Flexible interrupt prioritizing scheme with 256 interrupt priority levels
- Fast interrupt response

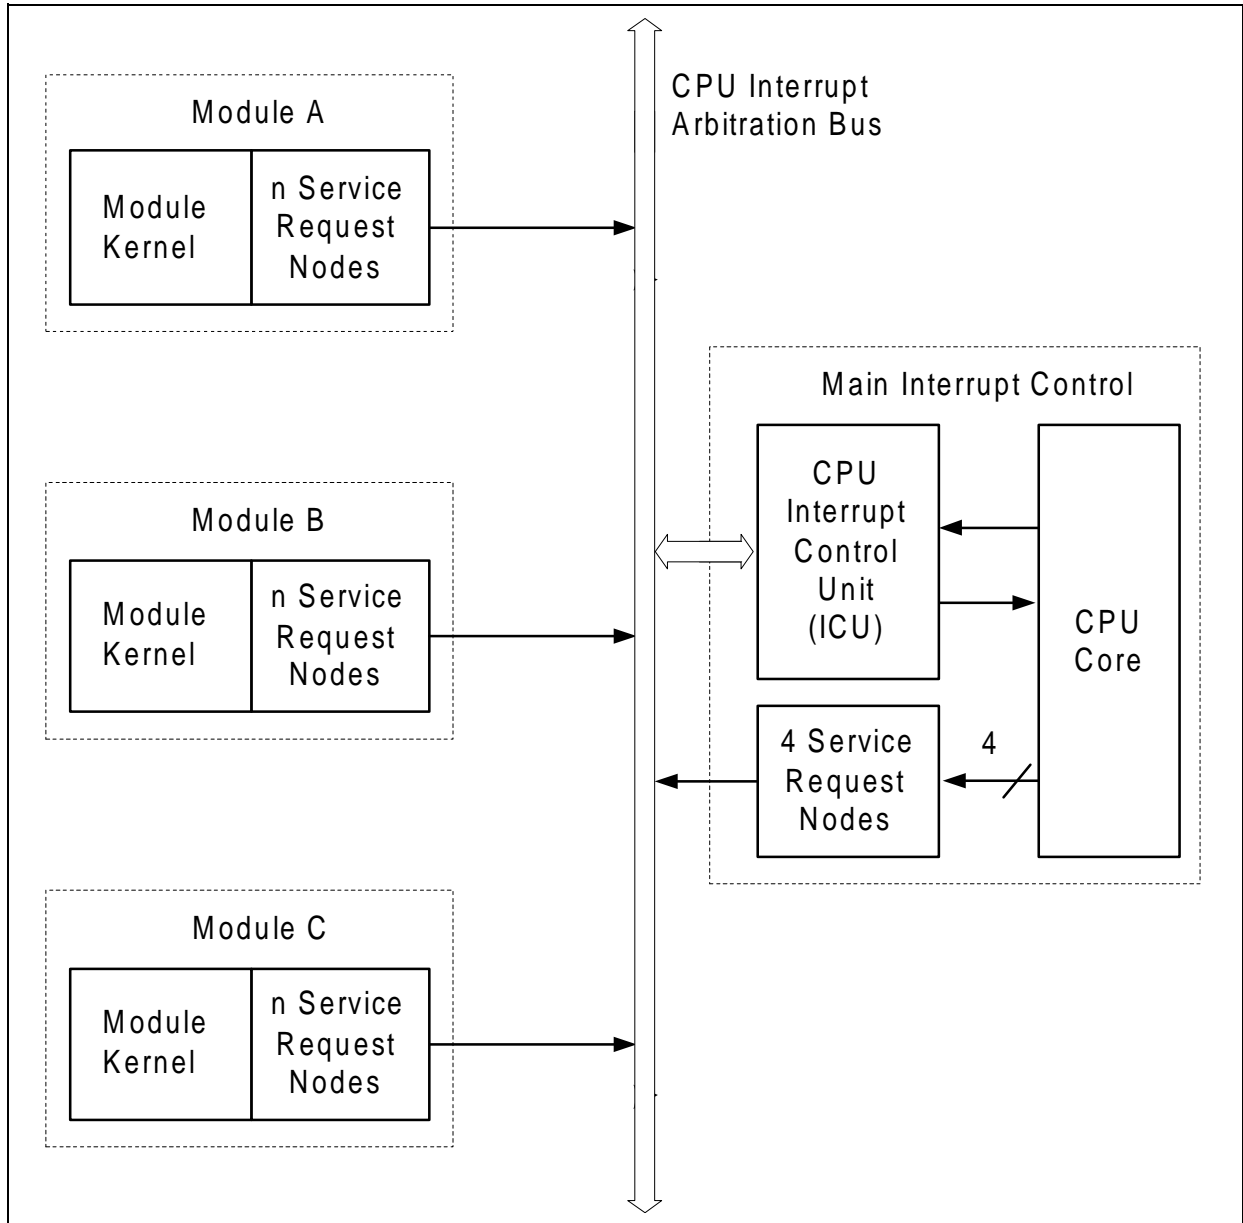

Figure 5 Block Diagram Interrupt System

PRELIMINARY

FPI-Bus

The Flexible Peripheral Interconnect Bus is designed with the requirements of high-performance Systems-on-Chip in mind.

Key Features:

- Core independent
- Multi-master capability
- Demultiplexed operation
- Clock synchronous
- Peak transfer rate of up to 200 MBytes/s (@ 50 MHz bus clock)
- Address and data bus scalable (32 bit address bus, 32 bit data bus)
- 8-/16- and 32 bit data transfers
- Broad range of transfer types from single to multiple data transfers
- Burst transfer capability
- EMI and power consumption minimized

LMB-Bus

The Local Memory Bus is a synchronous, pipelined, split bus with variable block size transfer support. All signals relate to the positive clock edge.

The protocol supports 8,16,32 & 64 bits single beat transactions and variable length 64 bits block transfers.

Key Features:

The LMB provides the following features:

- Optimized for high speed and high performance
- 32 bit address, 64 bit data busses
- Central simple per cycle arbitration
- Slave controlled wait state insertion
- Address pipelining (max depth - 2)
- Split transactions
- Variable block length - 2, 4 or 8 beats of 64 bit data

PRELIMINARY
On-Chip Debug System (OCDS)

The TC1910 architecture is supporting OCDS Level 1. This means access to FPI Bus and the whole FPI address space via the JTAG interface pins.

On-Chip Peripheral Units

The TC1910 offers several on-chip peripheral units such as serial controllers, timer units, and Codec module. Within the TC1910 all these peripheral units are connected to the TriCore CPU/system via the FPI (Flexible Peripheral Interconnect) Bus. Several IO lines on the TC1910 ports are reserved for these peripheral units to communicate with the external world.

Peripheral Units of the TC1910:

- Three Asynchronous/Synchronous Serial Channels with baudrate generator, parity, framing and overrun error detection, IrDA mode, FIFO buffers.
- One High Speed Synchronous Serial Channels with programmable data length and shift direction
- IIC module
- One multi-functional General Purpose Timer Units with three 32-bit timer/counter
- Dual channel Codec interface
- GPIO blocks

Table 1 Peripheral Modules

Module	Address Range	I/O Lines	Interrupt Nodes
Asynchronous Serial Channel 0 (ASC0)	F000 0A00 _H - F000 0AFF _H	RDX0, TDX0	ASC0_TSRC ASC0_RSRC ASC0_ESRC ASC0_TBSRC
Asynchronous Serial Channel 1 (ASC1)	F000 0B00 _H - F000 0BFF _H	RDX1, TDX1	ASC1_TSRC ASC1_RSRC ASC1_ESRC ASC1_TBSRC
Synchronous Serial Channel (SSC)	F000 0800 _H - F000 08FF _H	SCLK, MRST, MTSR	SSC_TSRC SSC_RSRC SSC_ESRC
Inter-IC Bus (IIC)	F000 0500 _H - F000 05FF _H	SCL, SDA	IIC_XP0SRC IIC_XP1SRC IIC_XP2SRC
Real Time Clock (RTC)	F000 0100 _H - F000 01FF _H	-	RTC_SRC

PRELIMINARY

Asynchronous/Synchronous Serial Interfaces (ASC 0/1)

The Asynchronous/Synchronous Serial Interface ASC provides serial communication between the TriCore and other microcontrollers, microprocessors or external peripherals.

Features:

- Full duplex asynchronous operating modes
 - 8- or 9-bit data frames, LSB first
 - Parity bit generation/checking
 - One or two stop bits
 - Baudrate from 3.125 MBaud to 0.74 Baud (@ 50 MHz module clock)
 - Multiprocessor mode for automatic address/data byte detection
 - Loop-back capability
- Half-duplex 8-bit synchronous operating mode
 - Baudrate from 6.25 MBaud to 637 Baud (@ 50 MHz module clock)
- Double buffered transmitter/receiver
- Interrupt generation
 - on a transmitter buffer empty condition
 - on a transmit last bit of a frame condition
 - on a receiver buffer full condition
 - on an error condition (frame, parity, overrun error)
- Support for IrDA
- Automatic Baudrate Detection
- 8 Byte FIFO

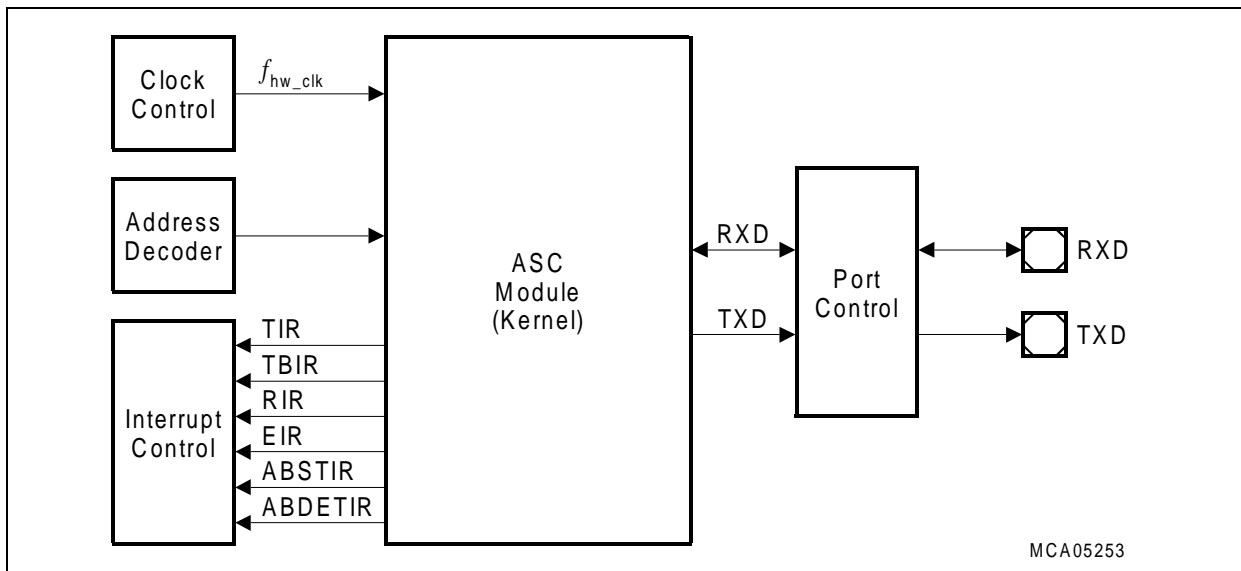

Figure 6 General Block Diagram of the ASC Interface

PRELIMINARY

High-Speed Synchronous Serial Interface (SSC)

The High Speed Synchronous Serial Interface SSC provides serial communication between microcontrollers, microprocessors or external peripherals. The SSC supports full-duplex and half-duplex synchronous communication up to 25 MBaud (@ 50 MHz module clock). The serial clock signal can be generated by the SSC itself (master mode) or be received from an external master (slave mode). Data width, shift direction, clock polarity and phase are programmable. This allows communication with SPI-compatible devices. Transmission and reception of data are double-buffered. A 16-bit baud rate generator provides the SSC with a separate serial clock signal.

Features:

- Master and slave mode operation
 - Full-duplex or half-duplex operation
- Flexible data format
 - Programmable number of data bits : 2 to 16 bit
 - Programmable shift direction : LSB or MSB shift first
 - Programmable clock polarity : idle low or high state for the shift clock
 - Programmable clock/data phase : data shift with leading or trailing edge of SCLK
- Maximum baudrate: 25 MBaud in Master, 12.5 in Slave mode (@ 50 MHz module clock)

Interrupt generation

- on a transmitter empty condition
- on a receiver full condition
- on an error condition (receive, phase, baudrate, transmit error)
- Three pin interface

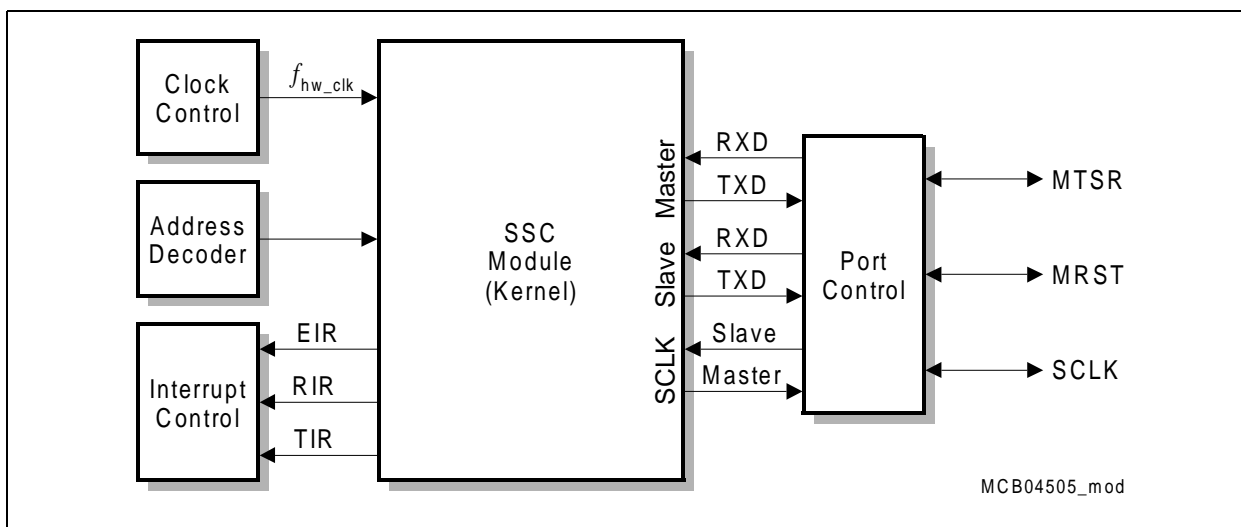

Figure 7 General Block Diagram of the SSC Interface

PRELIMINARY

Inter-IC Interface (IIC)

IIC supports a certain protocol to allow devices to communicate directly with each other via two wires. One line is responsible for clock transfer and synchronization (SCL), the other is responsible for the data transfer (SDA).

The on-chip IIC Bus module connects the platform buses to other external controllers and/or peripherals via the two-line serial IIC interface. The IIC Bus module provides communication at data rates of up to 400 kBit/s and features 7-bit addressing as well as 10-bit addressing. This module is fully compatible to the IIC bus protocol.

The module can operate in three different modes:

Master mode, where the IIC controls the bus transactions and provides the clock signal.

Slave mode, where an external master controls the bus transactions and provides the clock signal.

Multimaster mode, where several masters can be connected to the bus, i.e. the IIC can be master or slave.

The on-chip IIC bus module allows efficient communication via the common IIC bus. The module unloads the CPU of low level tasks like:

- (De)Serialization of bus data.
- Generation of start and stop conditions.
- Monitoring the bus lines in slave mode.
- Evaluation of the device address in slave mode.
- Bus access arbitration in multimaster mode.

IIC Features:

- Extended buffer allows up to 4 send/receive data bytes to be stored.
- Selectable baud rate generation.
- Support of standard 100 kBaud and extended 400 kBaud data rates.
- Operation in 7-bit addressing mode or 10-bit addressing mode.
- Flexible control via interrupt service routines or by polling.

PRELIMINARY

Timer Unit (GPTU)

Figure 8 shows a global view of all functional blocks of the GPTU module.

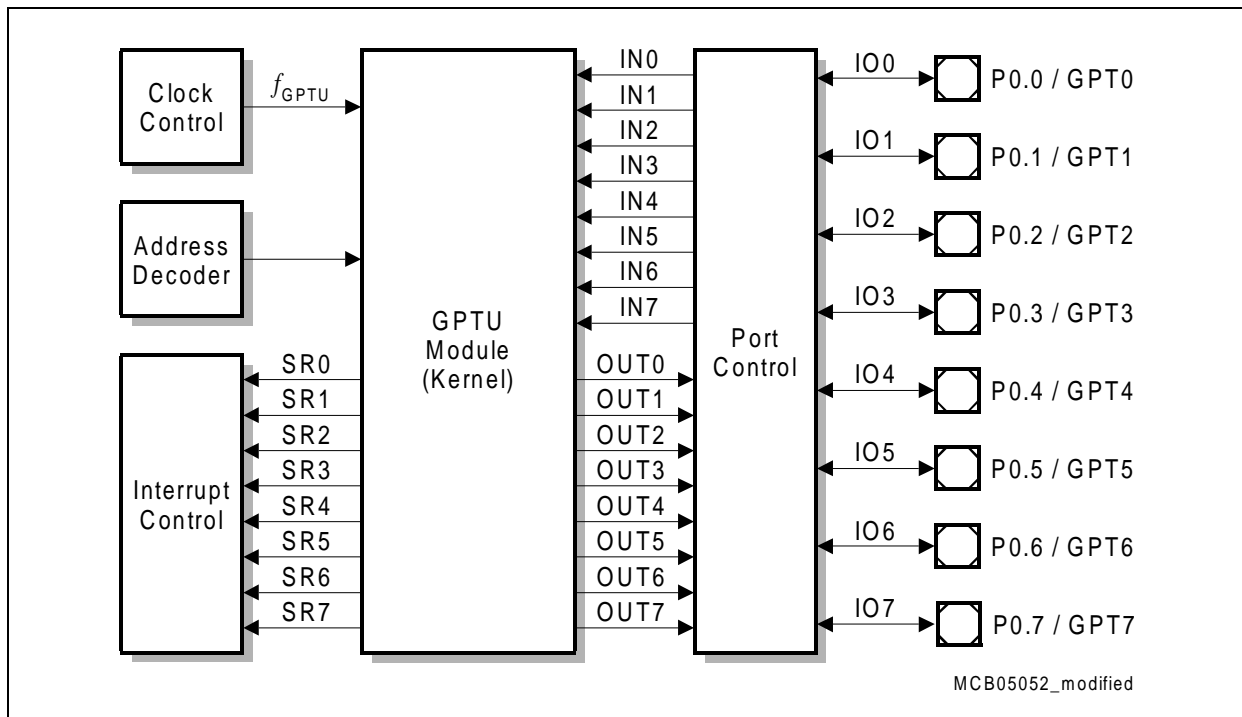

Figure 8 General Block Diagram of the GPTU Interface

The GPTU consists of three 32-bit timers designed to solve such application tasks as event timing, event counting, and event recording. The GPTU communicates with the external world via eight inputs and eight outputs.

The three timers of the GPTU module T0, T1, and T2, can operate independently from each other, or can be combined:

General Features:

- All timers are 32-bit precision timers with a maximum input frequency of $f_{GPTU}/2$.
- Events generated in T0 or T1 can be used to trigger actions in T2
- Timer overflow or underflow in T2 can be used to clock either T0 or T1
- T0 and T1 can be concatenated to form one 64-bit timer

Features of T0 and T1:

- Each timer has a dedicated 32-bit reload register with automatic reload on overflow
- Timers can be split into individual 8-, 16-, or 24-bit timers with individual reload registers
- Overflow signals can be selected to generate service requests, pin output signals, and T2 trigger events
- Two input pins can determine a count option

PRELIMINARY

Features of T2:

- Optionally count up or down
- Operating modes:
 - Timer
 - Counter
 - Incremental Interface Mode
- Options:
 - External start/stop, one-shot operation, timer clear on external event
 - Count direction control through software or an external event
 - Two 32-bit reload/capture registers
- Reload modes:
 - Reload on overflow or underflow
 - Reload on external event: positive transition, negative transition, or both transitions
- Capture modes:
 - Capture on external event: positive transition, negative transition, or both transitions
 - Capture and clear timer on external event: positive transition, negative transition, or both transitions
- Can be split into two 16-bit counter/timers
- Timer count, reload, capture, and trigger functions can be assigned to input pins. T0 and T1 overflow events can also be assigned to these functions.
- Overflow and underflow signals can be used to trigger T0 and/or T1 and to toggle output pins
- T2 events are freely assignable to the service request nodes.

Real Time Clock Unit RTC

The Real Time Clock (RTC) module is basically an independent timer chain and counts clock ticks. The base frequency of the RTC can be programmed via a reload counter. The RTC can work fully asynchronous to the system frequency and is optimized on low power consumption.

Features:

The RTC serves different purposes:

- Absolute system clock to determine the current time and date
- Cyclic time based interrupt
- Alarm interrupt for wake up on a defined time
- 48-bit timer for long term measurements

PRELIMINARY

Codec Interface

The speech A/D and D/A converters (called codec) is designed for telephone and speech recognition quality. They can be used for microphone / earpiece applications. The TC1910 configuration implements a dual channel speech codec connected to the FPI bus.

Figure 9 General Codec Overview

General Purpose I/Os (GPIO)

- Push/pull output drivers
- 3.3 Volt operation for GPIO
- Programmable pull-up/-down devices at all pins
- Optional Open Drain Output Mode

PRELIMINARY

Power Supply

Figure 10 shows the TC1910 power supply concept, where certain logic modules are individually supplied with power. In this way, the noise margin is improved in the especially sensitive modules, like the A/D converter and the CODEC.

Figure 10 TC1910 Power Supply Concept

PRELIMINARY

Power-Up Sequence

During Power-Up reset pin $\overline{\text{PORST}}$ has to be held active until both power supply voltages have reached at least their minimum values.

During the Power-Up time (rising of the supply voltages from 0 to their regular operating values) it has to be ensured, that the core V_{DD} power supply reaches its operating value first, and then the GPIO V_{DDP} power supply. During the rising time of the core voltage it must be ensured that $0 < V_{\text{DD}} - V_{\text{DDP}} < 0.5 \text{ V}$.

During power-down, the core and GPIO power supplies V_{DD} and V_{DDP} respectively, have to be switched off until all capacitances are discharged to zero, before the next power-up.

Note: The states of the pins are undefined when only the port voltage V_{DDP} is on.

PRELIMINARY

Electrical characteristics

Parameter Interpretation

The parameters listed in the following partly represent the characteristics of the TC1910 and partly its demands on the system. To aid in interpreting the parameters right, when evaluating them for a design, they are marked in column "Symbol":

CC (Controller Characteristics):

The logic of the TC1910 will provide signals with the respective characteristics.

SR (System Requirement):

The external system must provide signals with the respective characteristics to the TC1910.

PRELIMINARY
Absolute Maximum Ratings

Parameter	Symbol	Limit Values		Unit	Notes
		min.	max.		
Ambient temperature	T_A	-40	85	°C	under bias
Storage temperature	T_{ST}	-65	150	°C	
Junction temperature	T_J	–	125	°C	under bias
Voltage on I/O Supply pins with respect to ground (V_{SS})	V_{DDP}	-0.5	4.2	V	
Voltage on Core Supply pins with respect to ground (V_{SS})	V_{DD}	-0.3	2.1	V	
Voltage on PLL Supply pins with respect to ground (V_{SS})	V_{DDPLL}	-0.3	2.1	V	PLL
Voltage between Oscillator Supply Pins and ground (V_{SS}).	V_{DDOSC}	-0.3	2.1	V	
Voltage on any pin with respect to ground (V_{SS})	V_{IN}	-0.5	4.2	V	
Input current on any pin during overload condition	I_{OV}	-10	10	mA	
Absolute sum of all input currents at overload condition	ΣI_{OV}	–	100	mA	
Power dissipation	P_{DISS}	–	1.0	W	

Note: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. During absolute maximum rating overload conditions ($V_{IN} > V_{DD}$ or $V_{IN} < V_{SS}$) the voltage on V_{DD} pins with respect to ground (V_{SS}) must not exceed the values defined by the absolute maximum ratings.

PRELIMINARY
Package Parameters (P-LBGA-208)

Parameter	Symbol	Limit Values		Unit	Notes
		min.	max.		
Power dissipation	P_{DISS}	–	1.0	W	–
Thermal resistance	R_{THA}	–	30	K/W	Chip to ambient

Operating Conditions

The following operating conditions must not be exceeded in order to ensure correct operation of the TC1910. All parameters specified in the following sections refer to these operating conditions, unless otherwise noted.

Parameter	Symbol	Limit Values		Unit	Notes
		min.	max.		
Supply voltage	V_{DDP}	3.0	3.6 ¹⁾	V	I/O supply
	V_{DD}	1.71	1.89 ²⁾	V	Core supply
	V_{DDPLL}	1.71	1.89	V	PLL supply
	V_{DDOSC}	1.71	1.89	V	Oscillator supply
Ground voltage	V_{SS}	0		V	
Input current on any pin during overload condition	I_{OV}	-5	5	mA	$V_{OV} > V_{DDP} + 0.3V$ $V_{OV} < V_{SS} - 0.3V$
Absolute sum of all input currents at overload condition	$\sum I_{OV} $	–	50	mA	
Ambient temperature under bias	T_A	-40	85	°C	
CPU clock	f_{CPU}	–	66	MHz	
External Load Capacitance	C_L	–	50	pF	

1) Voltage overshoot to 4 V is permissible, provided the pulse duration is less than 100 μ s and the cumulated summary of the pulses does not exceed 1 h

2) Voltage overshoot to 2 V is permissible, provided the pulse duration is less than 100 μ s and the cumulated summary of the pulses does not exceed 1 h

PRELIMINARY
DC Characteristics
GPIO pins

Parameter	Symbol	Limit values		Unit	Test Conditions
		min.	max.		
Output low voltage (strong driver)	V_{OL}	-	1 0.4	V	$I_{OL} = 10 \text{ mA}$ $I_{OL} = 2.5 \text{ mA}$
Output high voltage (strong driver)	V_{OH}	2.4	-	V	$I_{OH} = - 2.5 \text{ mA}$
Output low voltage (medium driver) ¹⁾	V_{OL}	-	0.4	V	$I_{OL} = 1 \text{ mA}$
Output high voltage (medium driver) ¹⁾	V_{OH}	2.4	-	V	$I_{OH} = - 1 \text{ mA}$
Output low voltage (weak driver) ¹⁾	V_{OL}	-	0.4	V	$I_{OL} = 100 \mu\text{A}$
Output high voltage (weak driver) ¹⁾	V_{OH}	2.4	-	V	$I_{OH} = - 100 \mu\text{A}$
Input low voltage	V_{IL}	-0.3	0.8	V	LVTTL
Input high voltage	V_{IH}	2.0	$V_{DDP}+0.3$ or 3.7V	V	whatever is lower
Input leakage current	I_{OZ1}	-	± 500	nA	$0V < V_{in} < V_{DDP}$
Pull-up current ²⁾	$ I_{PUH} $	-	1	μA	$V_{OUT} = 2.0V$
Pull-up current ³⁾	$ I_{PUL} $	20	-	μA	$V_{OUT} = 0.8V$
Pull-down current	$ I_{PDL} $	-	0.8	μA	$V_{OUT} = 0.8V$
Pull-down current	$ I_{PDH} $	20	-	μA	$V_{OUT} = 2.0V$
Pin capacitance ¹⁾	C_{IO}	-	10	pF	$f = 1\text{MHz @}$ $T_A = 25^\circ\text{C}$

1) Not subject to production test, verified by design/characterization.

2) The maximum current that may be drawn while the respective signal line remains inactive.

3) The minimum current that must be drawn in order to drive the respective signal line active.

PRELIMINARY
NMI Pin

NMI Pin is an input pin with different Pull-Up characteristics than other pins. The related characteristics are given in the following table

Parameter	Symbol	Limit values		Unit	Test Conditions
		min.	max.		
Max. current allowed through the Pull-Up device while pin (input) voltage remains still at the high level	$ I_{PUH} $	-	4	uA	$V_{OUT}=2.0V$
Min. current needed through the Pull-Up device so that pin voltage is driven to the low level.	$ I_{PUL} $	100	-	uA	$V_{OUT}=0.8V$

Note: NMI Pin does not have a Pull-Down device.

Oscillator Pins

Parameter	Symbol	Limit values		Unit	Test Conditions
		min.	max.		
Input leakage current (analog input) at XTAL1 ¹⁾	I_{OZ1} CC	-	± 200	nA	$0V < V_{in} < V_{DDP}$
Input low voltage XTAL1	V_{ILX} SR	-	0.3	V	-
Input high voltage XTAL1 ²⁾	V_{IHX} SR	0.8	$V_{DD}-0.3$ $V_{DD}-0.35$ $V_{DD}-0.4$ $V_{DD}-0.43$	V	$f_{OSC}=4MHz$ $f_{OSC}=8MHz$ $f_{OSC}=12MHz$ $f_{OSC}=16MHz$
XTAL1 input current	I_{IX1} CC	-	± 20	μA	$0V < V_{IN} < V_{DD}$
XTAL3 input current ²⁾	I_{IX3} CC	-	± 0.5	μA	$0V < V_{IN} < V_{DD}$

1) Only applicable in deep sleep mode

2) Not subject to production test, verified by design/characterization.

PRELIMINARY
IIC Pins

Each IIC Pin is an open drain output pin with different characteristics than other pins. The related characteristics are given in the following table

Parameter	Symbol	Limit values		Unit	Test Conditions
		min.	max.		
Output low voltage	V_{OL} CC	-	0.4 0.6	V	3 mA 6 mA
Input high voltage ¹⁾	V_{IH} SR	$0.7V_{DDP}$	3.6	V	-
Input low voltage ¹⁾	V_{IL} SR	-0.3	$0.3V_{DDP}$	V	-
Input leakage current	I_{OZ2} CC	-	+ - 500	nA	
Pin capacitance ¹⁾	C_{IO} CC	-	10	pF	$f=1\text{MHz@}$ $T_A=25^\circ\text{C}$

¹⁾ Not subject to production test, verified by design/characterization.

Note: No 5 V IIC interface is supported with these pads. Only voltages lower than 3.60 V must be applied to these pads.

Note: IIC pins have no Pull-Up and Pull-Down devices.

PRELIMINARY
Codec Electrical Characteristics

Parameter	Symbol	Limit values			Unit	Test Conditions
		min.	typ.	max.		
Digital supply voltage	V_{DD}	1.71	1.8	1.89	V	
Analog supply voltage	V_{DDA}	3.0	3.3	3.6	V	
Analog supply ground	V_{SSA}	-0.1	0.0	+0.1	V	
External reference voltage	$V_{AREF}^{1)}$	1.14	1.2	+1.26 ²⁾	V	
Analog reference ground	V_{AGND}	$V_{SSA}-0.05$	V_{SSA}	$V_{SSA}+0.05$	V	
Analog input voltage (RMS)	V_{AIN}			0.775	V_{rms}	³⁾
Analog output voltage (RMS)	V_{AOUT}			0.775	V_{rms}	
Input Resistace of the Analog Inputs ⁴⁾	Rain	-	30	-	kOhm	differential input, gain: -12,-6, 0 dB
		-	15	-	kOhm	single-ended input, gain: -12,-6, 0 dB
		-	60	-	kOhm	differential input, gain: 6 to 30 dB
		-	30	-	kOhm	single-ended input, gain: 6 to 30 dB
Internal Reference Voltage Vref (Bandgap Voltage) ⁵⁾	V_{BGP}	1.1	1.2	1.3	V	AGCCR. BGPSEL[1,0] =00

1) Reference voltage outside the nominal range causes reduced dynamic range, decreased distortion/clipping margins, increased/decreased gain.

2) $V_{SSA}=V_{AGND}=0V$

3) Please take the gain settings of the analog preamplifier into account, therefore $V_{imaxreal}=V_{imax}/gain$

4) Simulation value.

5) For external usage, Bandgap reference voltage is strongly dependent on the external load (<500 MOhm). In this case, high impedance buffer must be used.

PRELIMINARY
Codec ADC and DAC path characteristics

Parameters	min.	typ.	max.	Unit	Test conditions ¹⁾
Attenuation distortion (ref. freq. 1014 Hz) (ref. level 0dBm0) ²⁾	0 -0.25 -0.25 -0.25 0		0.25 0.45	dB dB dB dB dB	< 0.025 0.025-0.0375 0.0375-0.3 0.3-0.425 > 0.425
Signal to total distortion		-55	-45	dB	at 0dBm0

Gain (ref. freq. 1014 Hz) (ref. level 0dBm0) ²⁾	-0.8	0	0.8	dB	receive & transmit
Power supply rejection ratio (PSRR)	-	-60 -40	-35 -35	dB dB	Receive (0.0375-0.425) ³⁾ Transmit(0.0375-0.425) ³⁾

¹⁾ Values given in this table are valid for all sampling frequencies.

²⁾ 0dBm0 is equivalent to -12dBm is equal to 194.7 mV_{RMS}.

³⁾ Supply ripple 70 mV.

Note: Numbers without units in the test conditions column are relative frequency values to the chosen sampling frequency. e.g. 0.425 equals 3.4 kHz @ 8 kHz sampling frequency.

PRELIMINARY

Power Supply Current

Parameter	Symbol	Limit values		Unit	Test Conditions
		typ. ¹⁾	max.		
Active mode supply current	I_{DD}	180	–	mA	Sum of all I_{DD} .
Idle mode supply current	I_{ID}	90	–	mA	at 1.8V Core Supply
Deep sleep mode supply current	I_{DS}	0.25	–	mA	at 1.8V Core Supply

¹⁾ Typical values are measured at 25°C, CPU clock at 66 MHz and nominal supply voltage, i.e. 3.3V for V_{DDP} and 1.8V for V_{DD} , V_{DDPLL} , V_{DDOSC}

Note: The Power Supply Current values refer to the total current at 1.8V power supply, at LMB/FPI bus frequency ratio of 2:1, while running an average application. These numbers are estimation based on average device measurements.

PRELIMINARY

AC Characteristics

Operating Conditions apply.

Output Rise/Fall Times

GPIO pins

Rise/fall time measurements are made between 10% and 90%.

The following table is valid for the GPIO pins pad drivers. Output pad characteristics are controllable via DRVCTR_x registers.

Pad Modus rise / fall time	Symbol	Limit values		Temp Comp	Unit	Test Conditions
		min.	max.			
Strong driver						
• sharp edge	SF	-	3	yes	ns	@50pF
• medium edge ¹⁾	SM	-	6	yes	ns	@50pF
• soft edge ¹⁾	SS	-	12	yes	ns	@50pF

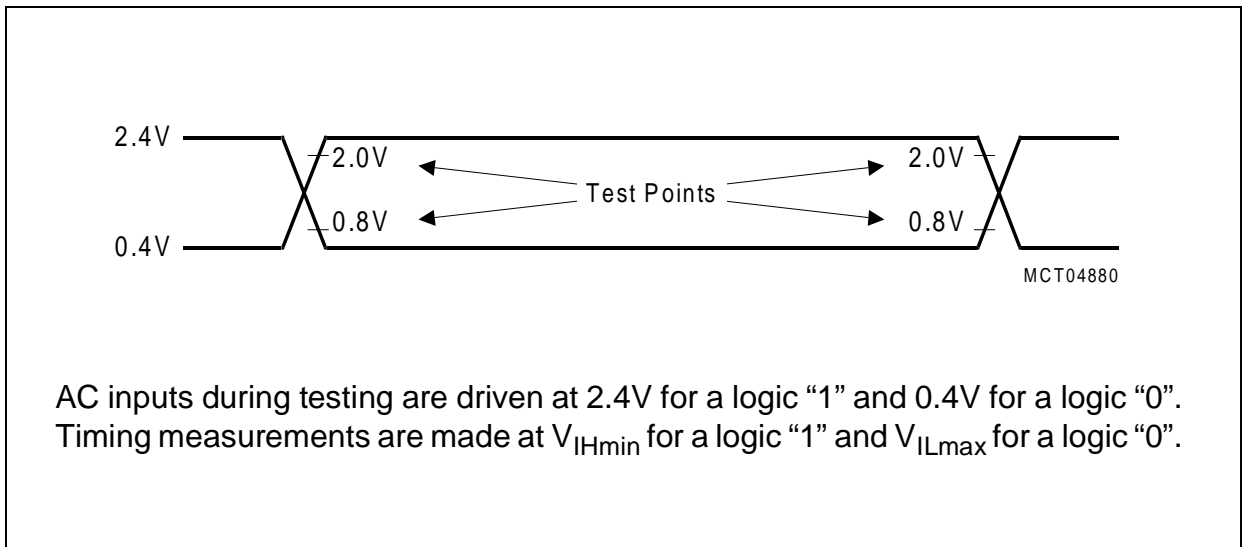

¹⁾ Not subject to production test, verified by design/characterization.

PRELIMINARY

Timing Characteristics

(Operating Conditions apply)

Note: Timing parameters are not subject to production test, they are verified by design/ characterization.

**Figure 11 Input/Output Waveforms for AC Tests
- for GPIO, Dedicated and EBU pins**

PRELIMINARY

External Oscillator at XTAL1 Timing Requirements

(Operating Conditions apply)

Parameter		Symbol	Limits		Unit
			min.	max.	
Main Oscillator XTAL frequency ¹⁾	with/without PLL	f_{OSC} SR	4	16	MHz
Frequency of an external oscillator driving at XTAL1 ²⁾	with PLL ³⁾ without PLL ⁴⁾	f_{OSCDD} SR	4 -	25 25	MHz
Input Clock high time		t_1 SR	16	-	ns
Input Clock low time		t_2 SR	16	-	ns
Input Clock rise time		t_3 SR	-	7	ns
Input Clock fall time		t_4 SR	-	7	ns

- 1) Oscillator Bypass Pin P3.11 latch-in value high. Internal oscillator provides the input clock signal.
- 2) Oscillator Bypass Pin P3.11 latch-in value low. Internal oscillator disabled. External oscillator provides the input clock signal.
- 3) Internal PLL provides the system clock. BYPASS pin latch-in value low. PLL prescaler value P=1.
- 4) Internal PLL bypassed. BYPASS pin latch-in value high. External oscillator provides the system clock directly. When CODEC modules is active its frequency limitations must be taken into consideration. Otherwise, minimum frequency in this mode can go as low as zero.

Figure 12 External Clock at XTAL1 Requirements

Note: V_{DDOSC} , V_{IHx} and V_{IHL} are defined in the Oscillator Pins DC Characteristics Chapter.

Note: It is strongly recommended to measure the oscillation allowance (negative resistance) in the final target system (layout) to determine the optimal parameters for the oscillator operation. Please refer to the limits specified by the crystal supplier.

PRELIMINARY

CPU Clock Timing

(Operating Conditions apply; $C_L = 50$ pF)

Parameter	Symbol	Limits		Unit

		250	300 ⁵⁾	MHz
PLL base frequency	$f_{PLLBASE}$	20	80 ²⁾	MHz
		20	130 ³⁾	MHz
		20	180 ⁴⁾	MHz
		20	230 ⁵⁾	MHz
PLL lock-in time	t_L	–	200	µs

1) Not subject to production test, verified by design/characterization.

2) @ vcosel = '00'

3) @ vcosel = '01'

4) @ vcosel = '10'

5) @ vcosel = '11'

Note: When TC1910 starts-up with the PLL not bypassed, first user instructions are executed with the frequency defined by the VCO free-running frequency ($f_{PLLBASE}$) and by the reset value of the PLL_CLC register (the K-divider and VCOSSEL bitfields). It is software responsibility to initialize its own appropriate values in the bitfields in this register, before giving the command for the VCO to lock to the input frequency. For more information, see the Users Manual, System Units, System Control Unit chapter.

PRELIMINARY

Figure 14 **Approximated Maximum Accumulated PLL Jitter**

The following two formulas define the (absolute) approximate maximum value of jitter D_N in [ns] dependent on the K-factor, the system clock frequency f_{SYS} in [MHz], and the number P of consecutive f_{SYS} periods.

$$\text{for } P < 0.25 \times f_{SYS} \quad D_N [\text{ns}] = \pm \left[\left(\frac{735}{f_{SYS} \times K} + 0.9 \right) \times \frac{P}{f_{SYS} \times 0.25} + 0.5 \right] \quad [1]$$

$$\text{for } P \geq 0.25 \times f_{SYS} \quad D_N [\text{ns}] = \pm \left[\frac{735}{f_{SYS} \times K} + 1.4 \right] \quad [2]$$

With rising number P of clock cycles the maximum jitter increases linearly up to a specific value of P . Beyond this value of P the maximum accumulated jitter remains at a constant value.
