GENERAL DESCRIPTION

The XRT94L33 is a highly integrated SONET/SDH terminator designed for E3/DS3/STS-1 mapping/de-mapping functions from either the STS-3 or STM-1 data stream. The XRT94L33 interfaces directly to the optical transceiver

The XRT94L33 processes the section, line and path overhead in the SONET/SDH data stream and also performs ATM and PPP PHY-layer processing. The processing of path overhead bytes within the STS-1s or TUG-3s includes 64 bytes for storing the J1 bytes. Path overhead bytes can be accessed through the microprocessor interface or via serial interface.

The XRT94L33 uses the internal E3/DS3 De-Synchronizer circuit with an internal pointer leak algorithm for clock smoothing as well as to remove the jitter due to mapping and pointer movements. These De-Synchronizer circuits do not need any external clock reference for its operation.

The SONET/SDH transmit blocks allow flexible insertion of TOH and POH bytes through both Hardware and Software. Individual POH bytes for the transmitted SONET/SDH signal are mapped either from the XRT94L33 memory map or from external interface. A1, A2 framing pattern, C1 byte and H1, H2 pointer byte are generated.

The SONET/SDH receive blocks receive SONET STS-3 signal or SDH STM-1 signal and perform the necessary transport and path overhead processing.

The XRT94L33 provides a line side APS (Automatic Protection Switching) interface by offering redundant receive serial interface to be switched at the frame boundary.

The XRT94L33 provides 3 Mappers for performing STS-1/VC-3 to STS-1/DS3/E3 mapping function, one for each STS-1/DS3/E3 framers.

A PRBS test pattern generation and detection is implemented to measure the bit-error performance.

A general-purpose microprocessor interface is included for control, configuration and monitoring.

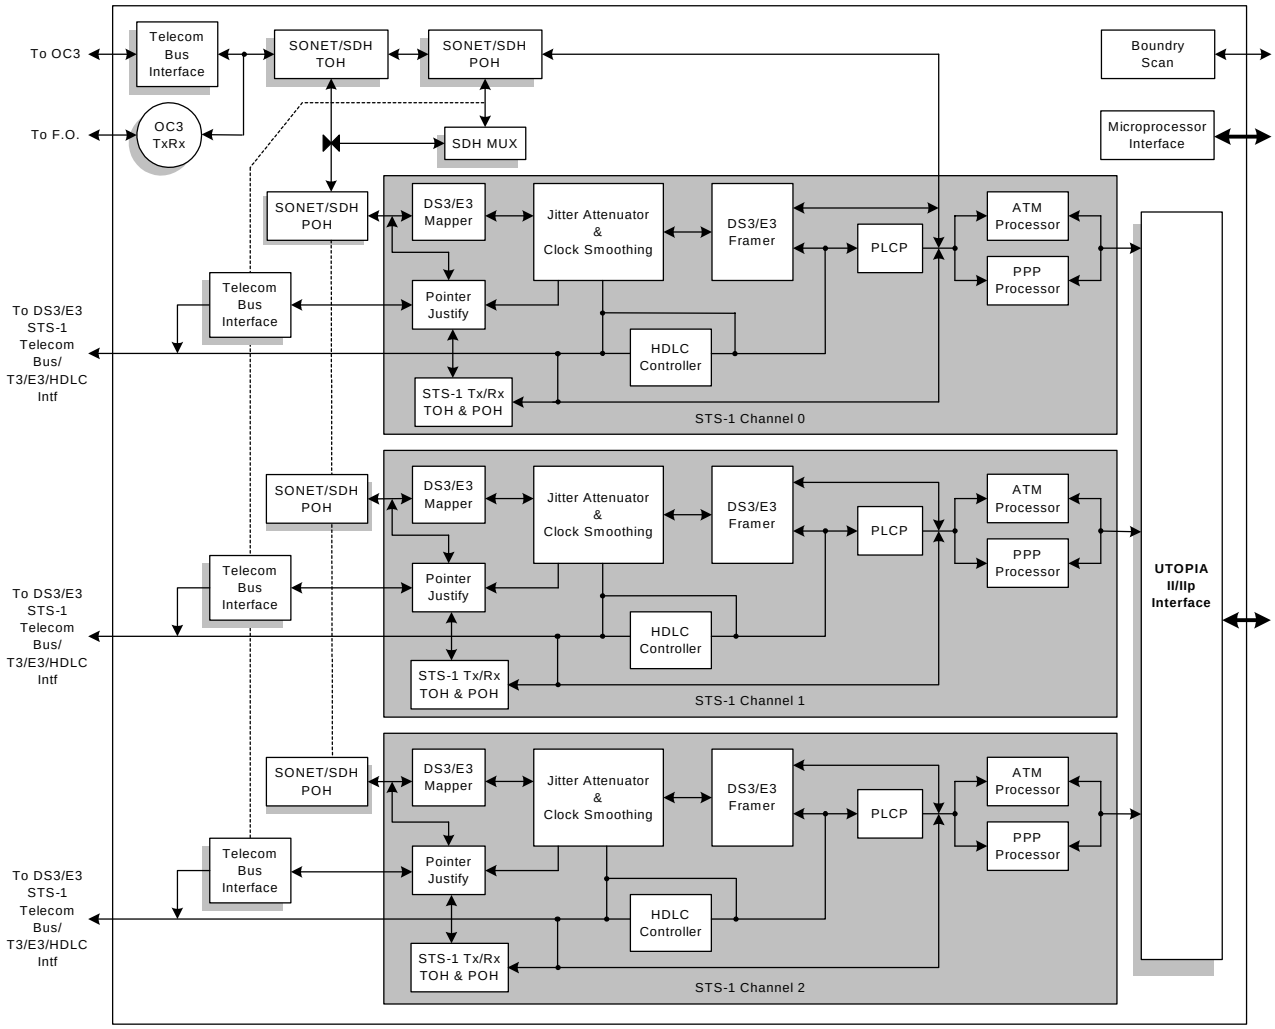
APPLICATIONS

- Network switches
- Add/Drop Multiplexer
- W-DCS Digital Cross Connect Systems

FEATURES

- Provides DS3/ E3 mapping/de-mapping for up to 3 tributaries through SONET STS-1 or SDH AU-3 and/or TUG-3/AU-4 containers
- Generates and terminates SONET/SDH section, line and path layers
- Integrated SERDES with Clock Recovery Circuit
- Provides SONET frame scrambling and descrambling
- Integrated Clock Synthesizer that generates 155 MHz and 77.76 MHz clock from an external 12.96/19.44/77.76 MHz reference clock
- Integrated 3 E3/DS3/STS-1 De-Synchronizer circuit that de-jitter gapped clock to meet 0.05UIpp jitter requirements
- Access to Line or Section DCC
- Level 2 Performance Monitoring for E3 and DS3
- Supports mixing of STS-1E and DS3 or E3 and DS3 tributaries
- UTOPIA Level 2 interface for ATM or level 2P for Packets
- E3 and DS3 framers for both Transmit and Receive directions
- Complete Transport/Section Overhead Processing and generation per Telcordia and ITU standards
- Single PHY and Multi-PHY operations supported
- Full line APS support for redundancy applications
- Loopback support for both SONET/SDH as well as E3/DS3/STS-1
- Boundary scan capability with JTAG IEEE 1149
- 8-bit microprocessor interface
- 3.3 V ± 5% Power Supply; 5 V input signal tolerance
- -40°C to +85°C Operating Temperature Range
- Available in a 504 Ball TBGA package

Block Diagram of the XRT94L33



ORDERING INFORMATION

PART NUMBER	PACKAGE TYPE	OPERATING TEMPERATURE RANGE
XRT94L33IB	27 x 27 504 Lead TBGA	-40°C to +85°C

1.0 XRT94L33 REGISTERS FOR SONET

1.1 THE OVERALL REGISTER MAP WITHIN THE XRT94L33

The XRT94L33 employs a direct Addressing Scheme. The Address Locations for each of the "Register Groups" (or Register pages) is presented in the Table below.

Table 1: The Address Register Map for the XRT94L33

ADDRESS LOCATION	REGISTER NAME	DEFAULT VALUE
	OPERATION CONTROL BLOCK REGISTERS	
0x0000 – 0x00FF	Reserved	
0x0100	Operation Control Register – Byte 3	0x00
0x0101	Operation Control Register – Byte 2	0x00
0x0102	Reserved	0x00
0x0103	Operation Control Register – Byte 0	0x00
0x0104	Operation Status Register – Byte 3 (Device ID)	0xE3
0x0105	Operation Status Register – Byte 2 (Revision ID)	0x01
0x0106 – 0x010A	Reserved	0x00
0x010B	Operation Interrupt Status Register – Byte 0	0x00
0x010C – 0x010E	Reserved	0x00
0x010F	Operation Interrupt Enable Register – Byte 0	0x00
0x0110 – 0x0111	Reserved	0x00
0x0112	Operation Block Interrupt Status Register – Byte 1	0x00
0x0113	Operation Block Interrupt Status Register – Byte 0	0x00
0x0114 – 0x0115	Reserved	0x00
0x0116	Operation Block Interrupt Enable Register – Byte 1	0x00
0x0117	Operation Block Interrupt Enable Register – Byte 0	0x00
0x0118 – 0x0119	Reserved	0x00
0x011A	Reserved	0x00
0x011B	Mode Control Register – Byte 0	0x00
0x011C – 0x011E	Reserved	0x00

1.2 THE OPERATION CONTROL BLOCK

The Operation Control Block is responsible for the following functions.

- Control of the Interrupt Structure (at the Highest Level within the XRT94L33)
- Control of the Clock Synthesizer block
- Control of the STS-3/STM-1 Telecom Bus Interface
- Control of the STS-1 Telecom Bus Interfaces

The register map for the Operation Control block is presented in the Table below. Additionally, a detailed description of each of the "Operation Control" Block registers is presented below.

1.2.1 OPERATION CONTROL BLOCK REGISTER

Table 2: Operation Control Register Address Map

ADDRESS LOCATION	REGISTER NAME	DEFAULT VALUE
0x0000 – 0x00FF	Reserved	0x00
0x0100	Operation Control Register – Byte 3	0x00
0x0101	Operation Control Register – Byte 2	0x00
0x0102	Reserved	0x00
0x0103	Operation Control Register – Byte 0	0x00
0x0104	Operation Status Register – Byte 3 (Device ID)	0xE3
0x0105	Operation Status Register – Byte 2 (Revision ID)	0x01
0x0106 – 0x010A	Reserved	0x00
0x010B	Operation Interrupt Status Register – Byte 0	0x00
0x010C – 0x010E	Reserved	0x00
0x010F	Operation Interrupt Enable Register – Byte 0	0x00
0x0110 – 0x0111	Reserved	0x00

1.2.2 OPERATION CONTROL REGISTER DESCRIPTION

Table 3: Operation Control Register – Byte 3 (Address Location= 0x0100)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused						Configuration Control	
R/O	R/O	R/O	R/O	R/O	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
Bit 7 – Bit 2	Unused	R/O	Please set to "0" for normal operation.
Bit 1 – Bit 0	Configuration Control	R/W	**Configuration Control:** These two READ/WRITE bit-fields permits the user to specify the mode/configuration that the XRT94L33 device should operate in. Please set to "01" for Mapper applications.

Table 4: Operation Control Register – Byte 2 (Address Location= 0x0101)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused					Interrupt Write Clear/RUR	Enable Interrupt Clear	Interrupt Enable
R/O	R/O	R/O	R/O	R/O	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
Bit 7 – Bit 3	Unused	R/O	Please set to "0" for normal operation.
Bit 2	Interrupt Write to Clear/RUR	R/W	**Interrupt – Write to Clear/RUR Select:** This READ/WRITE bit-field permits the user to configure all of the "Source-Level" Interrupt Status bits (within the XRT94L33) to either be "Write to Clear" (WTC) or "Reset-upon-Read" (RUR) bits. 0 – Configures all "Source-Level" Interrupt Status register bits to function as "Reset-upon-Read" (RUR). 1 – Configures all "Source-Level" Interrupt Status register bits to function as "Write-to-Clear" (WTC).
Bit 1	Enable Interrupt Clear	R/W	**Enable Auto-Clear of Interrupts Select:** This READ/WRITE bit-field permits the user to configure the XRT94L33 to automatically disable all interrupts that are activated. 0 – Configures the chip to NOT automatically disable any Interrupts following their activation. 1 – Configures the chip to automatically disable all Interrupts following their activation.
Bit 0	Interrupt Enable	R/W	**Interrupt Enable:** This READ/WRITE bit-field permits the user to configure the XRT94L33 to generate interrupt requests to the Microprocessor. 0 – Configures the chip to NOT generate interrupt to the Microprocessor. All interrupts are disabled and the Microprocessor must poll the register bits. 1 – Configures the chip to generate interrupts the Microprocessor.

Table 5: Operation Control Register – Byte 0 (Address Location= 0x0103)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Reserved							SW RESET
R/W	R/W	R/O	R/O	R/W	R/O	R/O	R/W
1	1	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
Bits 7 - 1	Unused	R/O	Please set to "0" for normal operation
Bit 0	SW Reset	R/W	**Software Reset – SONET Block:** This READ/WRITE bit-field permits the user to command a software reset to the SONET/SDH block. If the user invokes a software reset to the SONET/SDH blocks then all of the internal state machines will be reset to their default conditions; and each of the Receive STS-1/STS-3 TOH Processor blocks will undergo a re-frame operation. A "0" to "1" transition, within this bit-field commands this Software Reset. ***Notes:*** *This Software Reset does not reset the command registers to their default state. This can only be achieved by executing a "Hardware RESET" (e.g., by pulling the RESET_L* input pin "LOW"). This Software Reset does not affect the DS3/E3 Framer blocks. The Software Reset bit-field, for the DS3/E3 Framer block can be found in each of the 3 "DS3/E3 Operating Mode" registers (Address Location= 0xNF00).*

Table 6: Operation Status Register – Byte 3 (Address Location= 0x0104)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Device ID Value							
R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O
1	1	1	0	0	0	1	1

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 0	Device ID Value	R/O	**Device ID Value:** This READ-ONLY bit-field is set to the value "0xE3" and permits the user's software code to uniquely identify this device as being the XRT94L33.

Table 7: Operation Status Register – Byte 2 (Address Location= 0x0105)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Revision Number Value							
R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O
0	0	0	0	0	0	0	1

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 0	Revision Number Value	R/O	**Revision NumberValue:** This READ-ONLY bit-field is set to the value that corresponds to its revision number. Revision A silicon will be set to the value "0x01". This register permits the user's software code to uniquely identify the revision number of this device.

Table 8: Operation Interrupt Status Register – Byte 0 (Address Location= 0x010B)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused							TB Parity Error Interrupt Status
R/O	R/O	R/O	R/O	R/O	R/O	R/O	RUR/WTC
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
Bit 7 – Bit 1	Unused	R/O	Please set to "0" for normal operation
Bit 0	TB Parity Error Interrupt Status	RUR/ WTC	**Telecom Bus Parity Error Interrupt Status:** This "RESET-upon-READ" bit-field indicates whether or not the "Detection of 155.52Mbps Telecom Bus – Parity Error" interrupt has occurred since the last read of this register bit. 0 – Indicates that the "Detection of 155.52Mbps Telecom Bus – Parity Error" interrupt has NOT occurred since the last read of this register bit. 1 – Indicates that the "Detection of 155.52Mbps Telecom Bus – Parity Error" interrupt has occurred since the last of this register bit. ***Note:*** *This register bit is only active if the 155.52Mbps port is configured to operate via the Telecom Bus.*

Table 9: Operation Interrupt Enable Register – Byte 0 (Address Location= 0x010F)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused							Telecom Bus Parity Error Interrupt Enable
R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
Bit 7 – Bit 1	Unused	R/O	Please set to "0" for normal operation
Bit 0	TB Parity Error Interrupt Enable	R/W	**Telecom Bus Parity Error Interrupt Enable:** This "READ/WRITE" bit-field permits the user to either enable or disable the "Detection of 155.52Mbps Telecom Bus – Parity Error" interrupt. 0 – Disables the "Detection of 155.52Mbps Telecom Bus – Parity Error" interrupt. 1 – Enables the "Detection of 155.52Mbps Telecom Bus – Parity Error" interrupt. ***Note:*** *This register bit is only active if the 155.52Mbps port is configured to operate via the Telecom Bus.*

Table 10: Operation Block Interrupt Status Register – Byte 1 (Address Location= 0x0112)

R/W	R/W	R/O	R/W	R/W	R/W	R/W	R/O
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Operation Control Block Interrupt Enable	R/W	**Operation Control Block Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the Operation Control Block for interrupt generation. If the user writes a "0" into this register bit and disables the "Operation Control Block, then all "Operation Control Block" interrupts will be disabled for interrupt generation. If the user writes a "1" into this register bit, he/she will still need to enable the individual "Operation Control Block" interrupt(s) at the "Source Level" in order to enable that particular interrupt. 0 – Disables all "Operation Control Block" interrupts within the device. 1 – Enables the "Operation Control Block" at the "Block-Level" for interrupt generation
6	DS3/E3 Mapper Block Interrupt Enable	R/W	**DS3/E3 Mapper Block Interrupt Enable:** This READ/WRITE bit permits the user to either enable or disable the DS3/E3 Mapper Block for interrupt generation. If the user writes a "0" into this register bit, then all "DS3/E3 Mapper Block" interrupts will be disabled for interrupt generation. If the user writes a "1" into this register bit, he/she will still need to enable the individual "DS3/E3 Mapper Block" interrupt(s) at the "Source Level" in order to enable that particular interrupt. 0 – Disables all "DS3/E3 Mapper Block" interrupts within the device. 1 – Enables the "DS3/E3 Mapper Block" at the "Block-Level"
5	Unused	R/O	
4	Receive STS-1 TOH Block Interrupt Enable	R/W	**Receive STS-1 TOH (Transport Overhead) Processor Block Interrupt Enable**: This READ/WRITE bit permits the user to either enable or disable the Receive STS-1 TOH Processor Block for interrupt generation. If the user writes a "0" to this register bit and disables the "Receive STS-1 TOH Processor Block" (for interrupt generation), then all "Receive STS-1 TOH Processor Block" interrupts will be disabled for interrupt generation. If the user writes a "1" to this register bit, he/she will still need to enable the individual "Receive STS-1 TOH Processor Block" interrupt(s) at the "Source Level" in order to enable that particular interrupt. 0 – Disables all "Receive STS-1 TOH Processor Block" interrupts within the device. 1 – Enables the "Receive STS-1 TOH Processor Block" at the "Block-Level". ***Note:*** *This bit-field is inactive if the XRT94L33 has been configured to operate in the SDH Mode.*

3	Receive STS-1 POH Block Interrupt Enable	R/W	**Receive STS-1 POH (Path Overhead) Processor Block Interrupt Enable:** This READ/WRITE bit permits the user to either enable or disable the Receive STS-1 POH Processor Block for interrupt generation. If the user writes a "0" to this register bit and disables the "Receive STS-1 POH Processor Block" (for interrupt generation), then all "Receive STS-1 POH Processor Block" interrupts will be disabled for interrupt generation. If the user writes a "1" to this register bit, he/she will still need to enable the individual "Receive STS-1 POH Processor Block" interrupt(s) at the "Source Level" in order to enable that particular interrupt. 0 – Disables all "Receive STS-1 POH Processor Block" interrupts within the device. 1 – Enables the "Receive STS-1 POH Processor Block" at the "Block-Level". ***Note:*** *This bit-field is inactive if the XRT94L33 has been configured to operate in the SDH Mode.*
2	DS3/E3 Framer Block Interrupt Enable	R/W	**DS3/E3 Framer Block Interrupt Enable:** This READ/WRITE bit permits the user to either enable or disable the DS3/E3 Framer Block for interrupt generation. If the user writes a "0" to this register bit and disables the "DS3/E3 Framer Block" (for interrupt generation), then all "DS3/E3 Framer Block" interrupts will be disabled for interrupt generation. If the user writes a "1" to this register bit, he/she will still need to enable the individual "DS3/E3 Framer Block" interrupt(s) at the "Source Level" in order to enable that particular interrupt. 0 – Disables all "DS3/E3 Framer Block" interrupts within the device. 1 – Enables the "DS3/E3 Framer Block" at the "Block-Level".
1	Receive Line Interface Block Interrupt Enable	R/W	**Receive Line Interface Block Interrupt Enable:** This READ/WRITE bit permits the user to either enable or disable the Receive Line Interface Block for interrupt generation. If the user writes a "0" to this register bit and disables the "Receive Line Interface Block" (for interrupt generation), then all "Receive Line Interface Block" interrupts will be disabled for interrupt generation. If the user writes a "1" to this register bit, he/she will still need to enable the individual "Receive Line Interface Block" interrupt(s) at the "Source Level" in order to enable that particular interrupt. 0 – Disables all "Receive Line Interface Block" interrupts within the device. 1 – Enables the "Receive Line Interface Block" at the "Block-Level".
0	Unused	R/O

6	Receive STS-3 TOH Block Interrupt Enable	R/W	**Receive STS-3 TOH Processor Block Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Receive STS-3 TOH Processor Block" for interrupt generation. If the user writes a "0" to this register bit and disables the "Receive STS-3 TOH Processor Block" (for interrupt generation), then all "Receive STS-3 TOH Processor Block" interrupts will be disabled for interrupt generation. If the user writes a "1" to this register bit, he/she will still need to enable the individual "Receive STS-3 TOH Processor Block" interrupt(s) at the "Source Level" in order to enable that particular interrupt. 0 – Disables all "Receive STS-3 TOH Processor Block" interrupts within the device. 1 – Enables the "Receive STS-3 TOH Processor Block" at the "Block Level" for interrupt generation.
5	Receive SONET POH Block Interrupt Enable	R/W	**Receive SONET POH Processor Block Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Receive SONET POH Processor Block" for interrupt generation. If the user writes a "0" into this register bit and disables the "Receive SONET POH Processor Block" (for interrupt generation), then all "Receive SONET Processor Block" interrupts will be disabled for interrupt generation. If the user writes a "1" to this register bit, then he/she will still need to enable the individual "Receive SONET POH Processor Block" Interrupt(s) at the "Source Level" in order to enable that particular interrupt. 0 – Disables all "Receive SONET POH Processor Block" Interrupts within the device. 1 – Enables the "Receive SONET POH Processor Block" at the "Block Level" for interrupt generation.
4 - 0	Unused	R/O	

Table 14: Mode Control Register – Byte 0 (Address Location= 0x011B)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Disable Jitter Attenuator Fast Lock	TBUS0_IS_SDH	V1_PULSE_EN	TBUS0_MASTER	Reserved			AU-3/TUG-3* Mapping Select
R/W	R/W	R/W	R/W	R/O	R/O	R/O	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	DISFASTLOCK	R/W	**Disable Jitter Attenuator Fast lock:** This READ/WRITE bit field is used to disable the fast lock feature for the Jitter Attenuator block 0 – Fast Lock feature is enabled 1 – Fast Lock feature is disabled ***Note:*** *To configure the XRT94L33 such that it will comply with the Telcordia GR-253-CORE APS Recovery time requirements of 50ms, then the "Fast Lock" feaure MUST be enabled within the Jitter Attenuator block, by setting this bit-field to "0"*
6	TBUS0_IS_SDH		**Telecom Bus 0 operating in SDH Mode** This bit is used to qualify and process a Highrate SDH signal for Subrate Telecom Bus 0 operation. 0 - Clearing this bit will disable SDH format signal validation on Telecom Bus 0. Subrate Telecom Bus 0 RxD[7:0] data bus ouput will be disabled. 1 - Setting this bit will enable SDH format signal validation on Telecom Bus 0. It enables RxD[7:0] data bus output upon reception of a valid SDH signal format structure. ***Note:*** *This bit must be enabled in SDH mode for Subrate Telecom Bus 0 operation. This bit is ignored and does not apply in SONET mode of operation.*
5	V1_PULSE_EN		**V1 Pulse Enable** This bit provides the option of using an additional pulse on the Telecom Drop Bus RxD_C1J1 output pin and Telecom Add Bus TxA_C1J1 pin to denote the location or onset of V1 Byte within the Synchronous Payload Envelope/Virtual Container of the SONET/SDH frame whenever the Telecom Bus is processing the Virtual Tributary Group/Virtual Container multi-frame boundary 0 - Telecom Bus 0 in STS-3/STM-1 mode will not indicate a V1 pulse on RxD_CIJ1V1 output pin and TxA_C1J1V1 pin to indicate VT/VC multi-frame boundary. 1 - Telecom Bus 0 in STS-3/STM-1 mode has V1 pulse added on RxD_CIJ1V1 output pin and TxA_C1J1V1 pin to indicate VT/VC multi-frame boundary
4	TBUS0_MASTER		**Select Phase Timing Reference** This bit selects TxA_C1J1V1 and TxA_PL phase timing reference when operating the Subrate Add Telecom Bus 0 in Rephase OFF mode. 0 - Add Telecom Bus 0 timing in Slave Mode. TxA_C1J1V1 and TxA_PL

			pins are inputs. 1 - Add Telecom Bus 0 timing in Master Mode. TxA_C1J1V1 and TxA_PL pins are outputs.
3 - 1	Unused	R/O	Reserved
0	AU-3/TUG-3*	R/W	**AU-3/TUG-3 Mapping Select:** This READ/WRITE bit-field is used to to specify how the DS3/E3 data, associated with Channels 0, 1 and 2 are mapped into an SDH signal, as indicated below. 0 – DS3/E3 Channels are mapped into a VC-3, a TU-3, and then finally a TUG-3 structure, when being mapped into an STM-1 signal. 1 – DS3/E3 Channels are mapped into a VC-3 and then an AU-3 when being mapped into an STM-1 signal. ***Note:*** *This register bit is only active if the XRT94L33 has been configured to operate in the SDH Mode.*

R/O	R/O	R/O	R/O	R/W	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 4	Unused	R/O	
3 - 0	Loop-back[3:0]	R/W	**Loop-back Mode[3:0]** These four READ/WRITE bits-fields permit the user to configure the XRT94L33 to operate in a variety of loop-back modes, as is tabulated below.

Loop-back[3:0]	Resulting Loop-back Mode
0000	Normal Mode (e.g., No Loop-back Mode)
0001	**Remote Line Loop-back:** In this mode, all data that is received by the "Receive STS-3 TOH Processor" block will be routed to the "Transmit STS-3 TOH Processor block. ***Note:*** *If the user invokes this loop-back, then he/she must configure the Transmit STS-3/STM-1 circuitry to operate in the Loop-timing mode by setting Bit 6 (STS-3 Loop-Timing Mode) within the Receive Line Interface Control Register – Byte 1, to "1" (Address Location: 0x0302).*
0010	**Local Transport Loop-back:** In this mode, all data that is being output via the "Transmit STS-3 TOH Processor" block will also be internally routed to the "Receive STS-3 TOH Processor" block. **NOTES:** 1. *If the user configures the XRT94L33 device to operate in the "Local Transport Loop-back" Mode, then, in addition to "routing" the Transmit Output STS-3 data back into the "Receive Path", the Transmit Output STS-3 data is still output via either the Transmit STS-3 PECL Interface or the Transmit STS-3 Telecom Bus Interface.* 2. *The user must disable all "Automatic Transmission of AIS-P/AIS indicator upon Defects" features (within the chip) in order to permit this loop-back to function properly.*
0011	**Local Path Loop-back:** In this mode, all data that is output by the

					Transmit SONET POH Processor block (e.g., towards the "Transmit STS-3 TOH Processor" block) will be internally routed to the "Receive SONET POH Processor" block. ***NOTES:*** *1. This setting applies to all 3 Transmit SONET POH Processor and Receive SONET POH Processor blocks within the XRT94L33 device.* *2. The user must disable all "Automatic Transmission of AIS-P/AIS indicator upon Defects" features (within the chip) in order to permit this loop-back to function properly.*
				0100 - 1111	Reserved – Do Not Use

Table 22: Interface Control Register – Byte 0 (Address Location= 0x0133)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
SBSYNC_Delay[7:0]							
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 0	SBSYNC_Delay[7:0]	R/W	**STS-1 Telecom Bus – Sync Delay:** The Transmit STS-1 Telecom Bus is aligned to the "TxSBFP_in" input pin. The user is expected to apply a pulse (with the period of a 6.48MHz clock signal) at a rate of 8kHz to the "TxSBFP_in input (pin number G4). Each Transmit STS-1 Telecom Bus will align its transmission of the very first byte of a new STS-1 frame, with a pulse at this input pin. These READ/WRITE bit-fields permit the user to specify the amount of delay (in terms of 6.48MHz clock periods) that will exist between the rising edge of "TxSBFP_in" and the transmission of the very first byte, within a given STS-1 via the Transmit STS-1 Telecom Bus. Setting this register to "0x00" configures each of the Transmit STS-1 Telecom Bus Interfaces to transmit the very first byte of a new STS-1 frame, upon detection of the rising edge of the "TxSBFP_in". Setting this register to "0x01" configures each of the Transmit STS-1 Telecom Bus Interfaces to delay its transmission of the very first byte of a new STS-1 frame, by one 6.48MHz clock period, and so on. ***Note:*** *This register is only active if at least one of the three STS-1 Telecom Bus Interfaces are enabled.*

Table 23: STS-3/STM-1 Telecom Bus Control Register – Byte 3 (Address Location= 0x0134)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
HRSYNC_Delay[15:8]							
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 0	HRSYNC_Delay[15:8]	R/W	**STS-3 Telecom Bus – Sync Delay – Upper Byte:** The Transmit STS-3 TOH Processor block will generate the outbound STS-3/STM-1 frames in alignment with the 8kHz pulse that is being applied to the "TxSBFP_in" input pin. The user is expected to apply a pulse (with the period of a 19.44MHz clock signal) at a rate of 8kHz to the "TxSBFP_in input (pin number G4). The Transmit STS-3/STM-1 Telecom Bus will align its transmission of the very first byte of a new STS-3/STM-1 frame, with a pulse at this input pin. These READ/WRITE bit-fields permit the user to specify the amount of delay (in terms of 19.44MHz clock periods) that will exist between the rising edge of "TxSBFP_in" and the transmission of the very first byte, within a given STS-3 via the Transmit STS-3/STM-1 Telecom Bus. Setting these two registers to "0x0000" configures each of the Transmit STS-3/STM-1 Telecom Bus Interfaces to transmit the very first byte of a new STS-3 frame, upon detection of the rising edge of the "TxSBFP_in". Setting these register to "0x0001" configures each of the Transmit STS-3 Telecom Bus Interfaces to delay its transmission of the very first byte of a new STS-3 frame, by one 19.44MHz clock period, and so on. ***Note:*** *This register is also active if the user has configured the XRT94L33 device to transmit its outbound STS-3/STM-1 data via the Transmit STS-3/STM-1 PECL Interface block. As a consequence, the user can configure the XRT94L33 device to align its transmission of STS-3/STM-1 frames (via the Transmit STS-3/STM-1 PECL Interface) to the 8kHz signal that is being applied to the "TxSBFP_in" input pin.*

Table 24: STS-3/STM-1 Telecom Bus Control Register – Byte 2 (Address Location= 0x0135)

HRSYNC_Delay[7:0]							
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 0	HRSYNC_Delay[7:0]	R/W	**STS-3 Telecom Bus – Sync Delay – Lower Byte:** The Transmit STS-3 TOH Processor block will generate the outbound STS-3/STM-1 frame in alignment with the 8KHz pulse that is being applied to the "TxSBFP_in" input pin. The user is expected to apply a pulse (with the period of a 19.44MHz clock signal) at a rate of 8kHz to the "TxSBFP_in input (pin number G4). The Transmit STS-3/STM-1 Telecom Bus will align its transmission of the very first byte of a new STS-3/STM-1 frame, with a pulse at this input pin. These READ/WRITE bit-fields (along with that within the "Interface Control Register – Byte 3) permit the user to specify the amount of delay (in terms of 19.44MHz clock periods) that will exist between the rising edge of "TxSBFP_in" and the transmission of the very first byte, within a given STS-3 via the Transmit STS-3/STM-1 Telecom Bus. Setting this register to "0x0000" configures each of the Transmit STS-3/STM-1 Telecom Bus Interfaces to transmit the very first byte of a new STS-3 frame, upon detection of the rising edge of the "TxSBFP_in". Setting this register to "0x0001" configures each of the Transmit STS-3 Telecom Bus Interfaces to delay its transmission of the very first byte of a new STS-3 frame, by one 19.44MHz clock period, and so on. ***Note:*** *This register is also active if the user has configured the XRT94L33 device to transmit its outbound STS-3/STM-1 data via the Transmit STS-3/STM-1 PECL Interface block. As a consequence, the user can configure the XRT94L33 device to align its transmission of STS-3/STM-1 frames (via the Transmit STS-3/STM-1 PECL Interface) to the 8KHz signal that is being applied to the TxSBFP_in input pin.*

Table 25: STS-3/STM-1 Telecom Bus Control Register – Byte 0 (Address Location= 0x0137)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
STS-3/STM-1 Telecom Bus ON	Telecom Bus Disable	Is STS-3 Payload	Telecom Bus Parity Type	Telecom Bus J1 Only	Telecom Bus Parity Odd	Telecom Bus Parity Disable	STS-3 Rephase OFF
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
Bit 7	STS-3/STM-1 Telecom Bus ON	R/W	**STS-3/STM-1 Telecom Bus Interface Enable:** This READ/WRITE permits the user to either enable or disable the STS-3/STM-1 Telecom Bus Interface, as described below. 0 – Disables the STS-3/STM-1 Telecom Bus Interface is Disabled: STS-3/STM-1 data will output via "Interleave/De-Interleave" or "Clock/Data" Interface. 1 – Telecom Bus Interface is Enabled: In this selection, the STS-3/STM-1 Transmit and Receive Telecom Bus Interface will be enabled.
Bit 6	Telecom Bus Tri-State	R/W	**Telecom Bus Tri-state:** This READ/WRITE bit-field permits the user to "tri-state" the Telecom Bus Interface. 0 – Telecom Bus Interface is NOT tri-stated. 1 – Telecom Bus Interface is tri-stated. ***Note:*** *This READ/WRITE bit-field is ignored if the STS-3/STM-1 Transmit and Receive STS-3 Telecom Bus Interface is disabled.*
Bit 5	Is STS-3 Payload	R/W	**Is STS-3 Payload:** This READ/WRITE bit-field permits the user to configure STS-1 Telecom Bus Interface # 0 to support the STS-3 rate, as described below. 0 – Configures all three STS-1 Telecom Bus Interfaces to operate in the STS-1 Mode. 1 – Configures STS-1 Telecom Bus Interface # 0 to operate in the STS-3 Mode. In this configuration setting, only STS-1 Telecom Bus Interface # 0 will be active and will be operating at a rate of 19.44MHz. STS-1 Telecom Bus Interfaces # 1 and 2 will be disabled.
Bit 4	Telecom Bus Parity Type	R/W	**Telecom Bus Parity Type:** This READ/WRITE bit-field permits the user to define the parameters, over which "Telecom Bus" parity will be computed. 0 – Parity is computed/verified over the STS-3/STM-1 Transmit and Receive Telecom Bus – data bus pins (e.g., TXA_D[7:0] and RXD_D[7:0]). If the user implements this selection, then the following will happen. **a.** The STS-3/STM-1 Transmit Telecom Bus Interface will compute and output parity (via the "TXA_DP" output pin) based upon and coincident with the data being output via the "TXA_D[7:0]" output pins.

			b. The STS-3/STM-1 Receive Telecom Bus Interface will compute and verify the parity data (which is input via the "RXD_DP" input pin) based upon the data which is being input (and latched) via the "RXD_D[7:0]" input pins. 1 – Parity is computed/verified over the STS-3/STM-1 Transmit and Receive Telecom Bus – data bus pins (e.g., TXA_D[7:0] and RXD_D[7:0]); the C1J1 and PL input/output pins. If the user implements this selection, then the following will happen. **a.** The STS-3/STM-1 Transmit Telecom Bus Interface will compute and output parity (via the "TXA_DP" output) based upon and coincident with (1) the data being output via the "TXA_D[7:0]" output pins, (2) the state of the "TXA_PL" output pin, and (3) the state of the "TXA_C1J1" output pin. **b.** The STS-3/STM-1 Transmit Telecom Bus Interface will compute and verify the parity data (which is input via the "RXD_DP" input pin) based upon (1) the data which is being input (and latched) via the "RXD_D[7:0]" input pins, (2) the state of the "RXD_PL" input pin, and (3) the state of the "RXD_C1J1" input pin. ***Note:*** *This bit-field is disabled if the STS-3/STM-1 Telecom Bus is disabled. The user can configure the STS-3/STM-1 Telecom Bus to compute with either even or odd parity, by writing the appropriate data into Bit 2 (Telecom Bus Parity – Odd), within this register.*
Bit 3	Telecom Bus J1 Only	R/W	**Telecom Bus – J1 Indicator Only:** This READ/WRITE bit-field permits the user to configure how the STS-3/STM-1 Transmit and Receive Telecom Bus interface handles the "TXA_C1J1" and RXD_C1J1" signals, as described below. **0 – C1 and J1 Bytes** This selection configures the following. **c.** The STS-3/STM-1 Transmit Telecom Bus to pulse the "TXA_C1J1" output coincident to whenever the C1 and J1 bytes are being output via the "TXA_D[7:0]" output pins. **d.** The STS-3/STM-1 Receive Telecom Bus will expect the "RXD_C1J1" input to pulse "high" coincident to whenever the C1 and J1 bytes are being sampled via the "RXD_D[7:0]" input pins. **1 – J1 Bytes Only** This selection configures the following. **e.** The STS-3/STM-1 Transmit Telecom Bus Interface to only pulse the "TXA_C1J1" output pin coincident to whenever the J1 byte is being output via the "TXA_D[7:0]" output pins. ***Note:*** *The "TXA_C1J1" output pin will NOT be pulsed "high" whenever the C1 byte is being output via the "TXA_D[7:0]" output pins* **f.** The STS-3/STM-1 Receive Telecom Bus Interface will expect the "RXD_C1J1" input to only pulse "high" coincident to whenever the J1 byte is being sampled via the "RXD_D[7:0]" input pins. ***Note:*** *The "RXD_C1J1" input pin will NOT be pulsed "high" whenever the C1 byte is being input via the "RXD_D[7:0]" input pins*
Bit 2	Telecom Bus Parity Odd	R/W	**Telecom Bus Parity – ODD Parity Select:** This READ/WRITE bit-field permits the user to configure the STS-3/STM-1 Telecom Bus Interface to do the following.

			In the Transmit (Drop) Direction The STS-3/STM-1 Telecom Bus to compute either the EVEN or ODD parity over the contents of the (1) TxD_D[7:0] output pins, or (2) TxD_D[7:0] output pins, the states of the TxD_PL and TxD_C1J1 output pins (depending upon user setting for Bit 3). **In the Receive (Add) Direction** Receive STS-3/STM-1 Telecom Bus to compute and verify the EVEN or ODD parity over the contents of the (1) RxA_D[7:0] input pins, or (2) RxA_D[7:0] input pins, the states of the RxA_PL and RxA_C1J1 input pins (depending upon user setting for Bit 3). 0 – Configures Transmit (Drop) Telecom Bus to compute EVEN parity and configures the Receive (Add) Telecom Bus to verify EVEN parity. 1 – Configures Transmit (Drop) Telecom Bus to compute ODD parity and configures the Receive (Add) Telecom Bus to verify ODD parity.
Bit 1	Telecom Bus Parity Disable	R/W	**Telecom Bus Parity Disable:** This READ/WRITE bit-field permits the user to either enable or disable parity calculation and placement via the "TxA_DP" output pin. This bit field also permits the user to enable or disable parity verification by the Receive Telecom Bus. 0 – Enables Parity Calculation (on the Transmit Telecom Bus) and Disables Parity Verification (on the Receive Telecom Bus. 1 – Disables Parity Calculation and Verification
Bit 0	Rephase OFF Only	R/W	**Telecom Bus – Rephase Disable:** This READ/WRITE bit-field permits the user to configure the Receive STS-3/STM-1 Telecom Bus to internally compute the Pointer Bytes, based upon the data that it receives via the "RxD_D[7:0] input pins. ***Note:*** *If the Receive STS-3/STM-1 Telecom Bus is being provided with pulses denoting the C1 and J1 bytes (via the "RxD_C1J1" input pin), then this feature is unnecessary.* 1 – Disables Rephase 0 – Enables Rephase

BIT NUMBER	NAME	TYPE	DESCRIPTION
Bit 7	STS-1 Telecom Bus ON – Channel 2	R/W	**STS-1 Telecom Bus ON – Channel 2:** This READ/WRITE bit-field permits the user to either enable or disable the STS-1 Telecom Bus Interface associated with Channel 2. If this particular STS-1 Telecom Bus Interface is enabled, then all of the following events will occur. • The Transmit STS-1 Telecom Bus Interface (associated with Channel 2) will accept an STS-1 signal (in the Ingress Direction) and the XRT94L33 device will map this signal into an STS-3 signal. • The XRT94L33 device will de-map out the STS-1 signal (associated with Channel 2) and will output this STS-1 data-stream via the Receive STS-1 Telecom Bus Interface (associated with Channel 2). If the STS-1 Telecom Bus Interface associated with Channel 2 is disabled, then Channel 2 will support the mapping (de-mapping) of DS3, E3 or STS-1 data into (from) the STS-3 signal via the "LIU Interface". 0 – Disables the STS-1 Telecom Bus Interface associated with Channel 2. In this mode, the LIU Interface (associated with Channel 2) will now be enabled. Depending upon user's selection, the following functional blocks (within Channel 2) will now be enabled. **If Channel 2 is configured to operate in the DS3/E3 Mode:** • DS3/E3 Framer Block • DS3/E3 Mapper Block • DS3/E3 Jitter Attenuator/De-Sync Block **If Channel 2 is configured to operate in the STS-1 Mode** • Receive STS-1 TOH Processor Block • Receive STS-1 POH Processor Block • Transmit STS-1 POH Processor Block • Transmit STS-1 TOH Processor Block 1 – Enables the STS-1 Telecom Bus Interface, associated with Channel 2. In this mode, all DS3/E3 Framer block and STS-1 TOH/POH Processor block circuitry associated with Channel 2 will be disabled.
Bit 6	STS-1 Telecom Bus Tri-State # 2	R/W	**STS-1 Telecom Bus Tri-state – Channel 2:** This READ/WRITE bit-field permits the user to "tri-state" the Telecom Bus Interface associated with Channel 2

			Interface associated with Channel 2. 0 – Telecom Bus Interface is NOT tri-stated. 1 – Telecom Bus Interface is tri-stated. ***Note:*** *This READ/WRITE bit-field is ignored if the Transmit and Receive STS-1 Telecom Bus Interface (associated with Channel 2) is disabled.*
Bit 5	Unused	R/W	
Bit 4	STS-1 Telecom Bus Parity Type – Channel 2	R/W	**STS-1 Telecom Bus Parity Type – Channel 2:** This READ/WRITE bit-field permits the user to define the parameters, over which "Telecom Bus" parity will be computed. 0 – Parity is computed/verified over the STS-1 Transmit and Receive Telecom Bus – data bus pins (e.g., STS1TXA_D_2[7:0] and STS1RXD_D_2[7:0]). If the user implements this selection, then the following will happen. **g.** The Receive STS-1 Telecom Bus Interface will compute and output parity (via the "STS1RXD_DP_2" output pin) based upon and coincident with the data being output via the "STS1RXD_2_D[7:0]" output pins. **h.** The Transmit STS-1 Telecom Bus Interface will compute and verify the parity data (which is input via the "STS1TXA_DP_2" input pin) based upon the data which is being input (and latched) via the "STS1TXA_2_D[7:0]" input pins. 1 – Parity is computed/verified over the Transmit and Receive STS-1 Telecom Bus – data bus pins (e.g., STS1TXA_2_D[7:0] and STS1RXD_2_D[7:0]); the STS1TXA_C1J1_2, STS1RXD_C1J1_2, STS1TXA_PL_2 and STS1RXD_PL_2 input/output pins. If the user implements this selection, then the following will happen. a. The Receive STS-1 Telecom Bus Interface will compute and output parity (via the "RXD_DP_2" output) based upon and coincident with (1) the data being output via the "STS1RXD_2_D[7:0]" output pins, (2) the state of the "STS1RXD_PL_2" output pin, and (3) the state of the "STS1RXD_C1J1_2" output pin. b. The Transmit STS-1 Telecom Bus Interface will compute and verify the parity data (which is input via the "STS1TXA_DP_2" input pin) based upon (1) the data which is being input (and latched) via the "STS1TXA_2_D[7:0]" input pins, (2) the state of the "STS1TXA_PL_2" input pin, and (3) the state of the "STS1TXA_C1J1_2" input pin. ***Note:*** *This bit-field is disabled if the STS-1 Telecom Bus is disabled. The user can configure the STS-1 Telecom Bus to compute with either even or odd parity, by writing the appropriate data into Bit 2 (Telecom Bus Parity – Odd), within this register.*
Bit 3	STS-1 Telecom Bus J1 ONLY	R/W	**STS-1 Telecom Bus Interface – J1 Indicator Only – Channel 2:** This READ/WRITE bit-field permits the user to configure how the Transmit and Receive STS-1 Telecom Bus interface handles the "STS1TXA_C1J1_2" and STS1RXD_C1J1_2" signals, as described below. **0 – C1 and J1 Bytes** This selection configures the following. a. The Receive STS-1 Telecom Bus Interface to pulse the

			"STS1RXD_C1J1_2" output coincident to whenever the C1 and J1 bytes are being output via the "STS1RXD_2_D[7:0]" output pins. b. The Transmit STS-1 Telecom Bus Interface will expect the "STS1TXA_C1J1_2" input to be pulsed "high" coincident to whenever the C1 and J1 bytes are being sampled via the "STS1TXA_2_D[7:0]" input pins. **1 – J1 Bytes Only** This selection configures the following. a. The Receive STS-1 Telecom Bus Interface to only pulse the "STS1RXD_C1J1_2" output pin coincident to whenever the J1 byte is being output via the "STSRXD_2_D[7:0]" output pins. ***Note:*** *In this setting, the "STS1RXD_C1J1_2" output pin will NOT be pulsed "high" whenever the C1 byte is being output via the "STS1RXD_D_2[7:0]" output pins* b. The Transmit STS-1 Telecom Bus Interface will expect the "STS1TXA_C1J1_2" input to only be pulsed "high" coincident to whenever the J1 byte is being sampled via the "STS1TXA_2_D[7:0]" input pins. ***Note:*** *In this setting, the "STS1TXA_C1J1_2" input pin will NOT be pulsed "high" whenever the C1 byte is being input via the "STS1TXA_2_D[7:0]" input pins*
Bit 2	STS-1 Telecom Bus Parity Odd	R/W	**STS-1 Telecom Bus Interface Parity – ODD Parity Select – Channel 2:** This READ/WRITE bit-field permits the user to configure the STS-1 Telecom Bus Interface, associated with Channel 2 to do the following. **In the Receive (Drop) Direction** Receive STS-1 Telecom Bus Interface will compute either the EVEN or ODD parity over the contents of the (1) STS1RxD_2_D[7:0] output pins, or (2) STS1RxD_2_D[7:0] output pins, the states of the STS1RxD_PL_2 and STS1RxD_C1J1_2 output pins (depending upon user setting for Bit 3). **In the Transmit (Add) Direction** Transmit STS-1 Telecom Bus Interface will compute and verify the EVEN or ODD parity over the contents of the (1) STS1TxA_2_D[7:0] input pins, or (2) STS1TxA_2_D[7:0] input pins, the states of the STS1TxA_PL_2 and STS1TxA_C1J1_2 input pins (depending upon user setting for Bit 3). 0 – Configures Receive STS-1 (Drop) Telecom Bus Interface to compute EVEN parity and configures the Transmit STS-1 (Add) Telecom Bus Interface to verify EVEN parity. 1 – Configures Receive STS-1 (Drop) Telecom Bus Interface to compute ODD parity and configures the Transmit STS-1 (Add) Telecom Bus Interface to verify ODD parity.
Bit 1	STS-1 Telecom Bus Parity Disable	R/W	**STS-1 Telecom Bus Interface - Parity Disable – Channel 2:** This READ/WRITE bit-field permits the user to either enable or disable parity calculation and placement via the "STSRxD_DP_2" output pin. Further, this bit-field also permits the user to enable or disable parity verification via the "STS1TxA_DP_2" input pin by the Transmit Telecom Bus. 1 – Disables Parity Calculation (on the Receive Telecom Bus) and Disables Parity Verification (on the Transmit Telecom Bus. 0 – Enables Parity Calculation and Verification
Bit 0	STS-1 REPHASE OFF	R/W	**STS-1 Telecom Bus Interface – Rephase Disable – Channel 2:** This READ/WRITE bit-field permits the user to configure the Receive STS-1

	OFF		Telecom Bus to internally compute the Pointer Bytes, based upon the data that it receives via the "RxD_D[7:0] input pins. ***Note:*** *If the Receive STS-1 Telecom Bus is being provided with pulses denoting the C1 and J1 bytes (via the "RxD_C1J1" input pin), then this feature is unnecessary.* 1 – Disable Rephase If the user implements this selection, then the Transmit STS-1 Telecom Bus Interface (associated with Channel 2) will rely on the signaling that is provided via the "STS1TXA_C1J1_2" and "STS1TXA_PL_2" input pins, in order to determine the location of the STS-1 SPE (within the Ingress Direction STS-1 signal) with respect to the STS-1 frame boundaries. 0 – Enable Rephase If the user implements this selection, then the Transmti STS-1 Telecom Bus Interface (associated with Channel 2) will NOT rely on the signaling that is provided via the "STS1TXA_C1J1_2" and the "STS1TXA_PL_2" input pins in order to determine the location of the STS-1 SPE (within the Ingress Direction STS-1 signal) with respectg to the STS-1 frame boundaries. In this case the Transmit STS-1 TOH and POH Processor blocks (will be enabled) and will take on the role of locating the STS-1 SPE within the Ingress Direction STS-1 signal.

BIT NUMBER	NAME	TYPE	DESCRIPTION
Bit 7	STS-1 Telecom Bus ON - Channel 1	R/W	**STS-1 Telecom Bus ON – Channel 1:** This READ/WRITE bit-field permits the user to either enable or disable the STS-1 Telecom Bus Interface associated with Channel 1. If this particular STS-1 Telecom Bus Interface is enabled, then all of the following events will occur. • The Transmit STS-1 Telecom Bus Interface (associated with Channel 1) will accept an STS-1 signal (in the Ingress Direction) and the XRT94L33 device will map this signal into an STS-3 signal. • The XRT94L33 device will de-map out the STS-1 signal (associated with Channel 1) and will output this STS-1 data-stream via the Receive STS-1 Telecom Bus Interface (associated with Channel 1). If the STS-1 Telecom Bus Interface associated with Channel 1 is disabled, then Channel 1 will support the mapping (de-mapping) of DS3, E3 or STS-1 data into (from) the STS-3 signal via the "LIU Interface". 0 – Disables the STS-1 Telecom Bus Interface associated with Channel 1. In this mode, the LIU Interface (associated with Channel 1) will now be enabled. Depending upon user's selection, the following functional blocks (within Channel 1) will now be enabled. **If Channel 1 is configured to operate in the DS3/E3 Mode:** • DS3/E3 Framer Block • DS3/E3 Mapper Block • DS3/E3 Jitter Attenuator/De-Sync Block **If Channel 1 is configured to operate in the STS-1 Mode:** • Receive STS-1 TOH Processor Block • Receive STS-1 POH Processor Block • Transmit STS-1 POH Processor Block • Transmit STS-1 TOH Processor Block 1 – Enabes the STS-1 Telecom Bus Interface, associated with Channel 1. In this mode, all DS3/E3 Framer block and STS-1 TOH/POH Processor block circuitry associated with Channel 1 will be disabled.

Bit 6	STS-1 Telecom Bus Tri-State # 1	R/W	**STS-1 Telecom Bus Tri-state – Channel 1:** This READ/WRITE bit-field permits the user to "tri-state" the Telecom Bus Interface. 0 – Telecom Bus Interface is NOT tri-stated. 1 – Telecom Bus Interface is tri-stated. ***Note:*** *This READ/WRITE bit-field is ignored if the STS-1 Transmit and Receive Telecom Bus Interface is disabled.*
Bit 5	Unused	R/O	
Bit 4	STS-1 Telecom Bus Parity Type # 1	R/W	**STS-1 Telecom Bus Parity Type – Channel 1:** This READ/WRITE bit-field permits the user to define the parameters, over which "Telecom Bus" parity will be computed. 0 – Parity is computed/verified over the STS-1 Transmit and Receive Telecom Bus – data bus pins (e.g., STS1TXA_D_1[7:0] and STS1RXD_D_1[7:0]). If the user implements this selection, then the following will happen. a. The STS-1 Receive Telecom Bus Interface will compute and output parity (via the "STS1RXD_DP_1" output pin) based upon and coincident with the data being output via the "STS1RXD_D_1[7:0]" output pins. b. The STS-1 Transmit Telecom Bus Interface will compute and verify the parity data (which is input via the "STS1TXA_DP_1" input pin) based upon the data which is being input (and latched) via the "STS1TXA_D_1[7:0]" input pins. 1 – Parity is computed/verified over the STS-1 Transmit and Receive Telecom Bus – data bus pins (e.g., STS1TXA_D_1[7:0] and STS1RXD_D_1[7:0]); the STS1TXA_C1J1_1, STS1RXD_C1J1_1, STS1TXA_PL_1 and STS1RXD_PL_1 input/output pins. If the user implements this selection, then the following will happen. a. The STS-1 Receive Telecom Bus Interface will compute and output parity (via the "STS1RXD_DP_1" output) based upon and coincident with (1) the data being output via the "STS1RXD_D_1[7:0]" output pins, (2) the state of the "STS1RXD_PL_1" output pin, and (3) the state of the "STS1RXD_C1J1_1" output pin. b. The STS-1 Transmit Telecom Bus Interface will compute and verify the parity data (which is input via the "STS1TXA_DP_1" input pin) based upon (1) the data which is being input (and latched) via the "STS1TXA_D_1[7:0]" input pins, (2) the state of the "STS1TXA_PL_1" input pin, and (3) the state of the "STS1TXA_C1J1_1" input pin. ***Note:*** *This bit-field is disabled if the STS-1 Telecom Bus is disabled. The user can configure the STS-1 Telecom Bus to compute/verify with either even or odd parity, by writing the appropriate data into Bit 2 (Telecom Bus Parity – Odd), within this register.*
Bit 3	STS-1 Telecom Bus J1 ONLY	R/W	**Telecom Bus – J1 Indicator Only – Channel 1:** This READ/WRITE bit-field permits the user to configure how the STS-1 Transmit and Receive Telecom Bus interface handles the "STS1TXA_C1J1_1" and STS1RXD_C1J1_1" signals, as described below. **0 – C1 and J1 Bytes** This selection configures the following.

			a. The STS-1 Receive Telecom Bus to pulse the "STS1RXD_C1J1_1" output coincident to whenever the C1 and J1 bytes are being output via the "STS1RXD_D_1[7:0]" output pins. b. The STS-1 Transmit Telecom Bus will expect the "STS1TXA_C1J1_1" input to pulse "high" coincident to whenever the C1 and J1 bytes are being sampled via the "STS1TXA_D_1[7:0]" input pins. **1 – J1 Bytes Only** This selection configures the following. **i.** The STS-1 Receive Telecom Bus Interface to only pulse the "STS1RXD_C1J1_1" output pin coincident to whenever the J1 byte is being output via the "STS1RXD_D_1[7:0]" output pins. ***Note:*** *The "STS1RXD_C1J1_1" output pin will NOT be pulsed "high" whenever the C1 byte is being output via the "STS1RXD_D_1[7:0]" output pins).* **j.** The STS-1 Transmit Telecom Bus Interface will expect the "STS1TXA_C1J1_1" input to only pulse "high" coincident to whenever the J1 byte is being sampled via the "STS1TXA_D_1[7:0]" input pins. ***Note:*** *The "STS1TXA_C1J1_1" input pin will NOT be pulsed "high" whenever the C1 byte is being input via the "STS1TXA_D_1[7:0]" input pins).*
Bit 2	STS-1 Telecom Bus Parity Odd	R/W	**Telecom Bus Parity – ODD Parity Select – Channel 1:** This READ/WRITE bit-field permits the user to configure the STS-1 Telecom Bus Interface, associated with Channel 1 to do the following. **In the Receive (Drop) Direction** Receive STS-1 Telecom Bus to compute either the EVEN or ODD parity over the contents of the (1) STS1RxD_D_1[7:0] output pins, or (2) STS1RxD_D_1[7:0] output pins, the states of the STS1RxD_PL_1 and "STS1RxD_C1J1_1 output pins (depending upon user setting for Bit 3). **In the Transmit (Add) Direction** Transmit STS-1 Telecom Bus to compute and verify the EVEN or ODD parity over the contents of the (1) STS1TxA_D_1[7:0] input pins, or (2) STS1TxA_D_1[7:0] input pins, the states of the STS1TxA_PL_1 and STS1TxA_C1J1_1 input pins (depending upon user setting for Bit 3).0 – Configures Receive (Drop) Telecom Bus to compute EVEN parity and configures the Transmit (Add) Telecom Bus to verify EVEN parity1 – Configures Receive (Drop) Telecom Bus to compute ODD parity and configures the Transmit (Add) Telecom Bus to verify ODD parity.
Bit 1	STS-1 Telecom Bus Parity Disable	R/W	**STS-1 Telecom Bus Parity Disable – Channel 1:** This READ/WRITE bit-field permits the user to either enable or disable parity calculation and placement via the "STSRxD_DP_1" output pin. Further, this bit field also permits the user to enable or disable parity verification via the "STS1TxA_DP_1" input pin by the Transmit Telecom Bus.1 – Disables Parity Calculation (on the Receive Telecom Bus) and Disables Parity Verification (on the Transmit Telecom Bus. 0 – Enables Parity Calculation and Verification
Bit 0	STS-1 REPHASE OFF	R/W	**STS-1 Telecom Bus – Rephase Disable – Channel 1:** This READ/WRITE bit-field permits the user to configure the Receive STS-1 Telecom Bus to internally compute the Pointer Bytes, based upon the data that it receives via the "RxD_D[7:0] input pins.*If the Receive STS-1 Telecom Bus is being provided with pulses denoting the C1 and J1 bytes*

			*(via the "RxD_C1J1" input pin), then this feature is unnecessary.*1 – Disables Rephase 0 – Enables Rephase

BIT NUMBER	NAME	TYPE	DESCRIPTION
Bit 7	STS-1 Telecom Bus ON # 0	R/W	**STS-1 Telecom Bus ON – Channel 0:** This READ/WRITE bit-field permits the user to either enable or disable the Telecom Bus associated with STS-1 Telecom Bus # 0. If the STS-1 Telecom Bus is enabled, then an STS-1 signal will be mapped into (demapped from) the STS-3 signal. If STS-1 Telecom Bus Interface – Channel 3 is disabled, then Channel 0 will support the mapping of DS3, E3 or STS-1 into the STS-3 signal. 0 – STS-1 Telecom Bus # 0 is disabled. In this mode, DS3/E3/STS-1 Channel 0 will now be enabled. Depending upon user's selection, the following functional blocks (within Channel 0) will now be enabled. **If DS3/E3 Framing is supported** • DS3/E3 Framer Block • DS3/E3 Mapper Block • DS3/E3 Jitter Attenuator/De-Sync Block **If STS-1 Framing is supported** • Receive STS-1 TOH Processor Block • Receive STS-1 POH Processor Block • Transmit STS-1 POH Processor Block • Transmit STS-1 TOH Processor Block 1 – STS-1 Telecom Bus # 0 is enabled. In this mode, all DS3/E3 Framer block and STS-1 circuitry associated with Channel 0 will be disabled.
Bit 6	STS-1 Telecom Bus Tri-State # 0	R/W	**STS-1 Telecom Bus Tri-state – Channel 0:** This READ/WRITE bit-field permits the user to "tri-state" the Telecom Bus Interface. 0 – Telecom Bus Interface is NOT tri-stated. 1 – Telecom Bus Interface is tri-stated. ***Note:*** *This READ/WRITE bit-field is ignored if the STS-1 Transmit and Receive Telecom Bus Interface is disabled.*
Bit 5	STS-3c REPHASE OFF	R/O	**STS-3c While Rephase Off:** This READ/WRITE bit-field permits the user to configure the STS-1 Telecom Bus # 0 to process STS-3c data while the "Rephase" feature is disabled. If

			the user configures the STS-1 Telecom Bus Interface to process STS-3c data then the following functional blocks (within the XRT94L33 device) will now become active. • The Transmit STS-3c POH Processor block • The Receive STS-3c POH Processor block 0 – Configures STS-1 Telecom Bus # 0 to process STS-3 data. 1 – Configures STS-1 Telecom Bus # 0 to process STS-3c data. ***Note:*** *This bit-field is only active if STS-1 Telecom Bus Interface # 0 has been configured to support "STS-3" Operation. This bit-field ignored if STS-1 Telecom Bus Interface # 0 has been configured to operate in the STS-1 Mode.*
Bit 4	STS-1 Telecom Bus Parity Type # 0	R/W	**STS-1 Telecom Bus Parity Type – Channel 0:** This READ/WRITE bit-field permits the user to define the parameters, over which "Telecom Bus" parity will be computed. 0 – Parity is computed/verified over the Transmit and Receive STS-1 Telecom Bus – data bus pins (e.g., STS1TXA_D_0[7:0] and STS1RXD_D_0[7:0]). If the user implements this selection, then the following will happen. a. The STS-1 Receive Telecom Bus Interface will compute and output parity (via the "STS1RXD_DP_0" output pin) based upon and coincident with the data being output via the "STS1RXD_D_0[7:0]" output pins. b. The STS-1 Transmit Telecom Bus Interface will compute and verify the parity data (which is input via the "STS1TXA_DP_0" input pin) based upon the data which is being input (and latched) via the "STS1TXA_D_0[7:0]" input pins. 1 – Parity is computed/verified over the STS-1 Transmit and Receive Telecom Bus – data bus pins (e.g., STS1TXA_D_0[7:0] and STS1RXD_D_0[7:0]); the STS1TXA_C1J1_0, STS1RXD_C1J1_0, STS1TXA_PL_0 and STS1RXD_PL_0 input/output pins. If the user implements this selection, then the following will happen. a. The STS-1 Receive Telecom Bus Interface will compute and output parity (via the "STS1RXD_DP_0" output) based upon and coincident with (1) the data being output via the "STS1RXD_D_0[7:0]" output pins, (2) the state of the "STS1RXD_PL_0" output pin, and (3) the state of the "STS1RXD_C1J1_0" output pin. b. The STS-1 Transmit Telecom Bus Interface will compute and verify the parity data (which is input via the "STS1TXA_DP_0" input pin) based upon (1) the data which is being input (and latched) via the "STS1TXA_D_0[7:0]" input pins, (2) the state of the "STS1TXA_PL_0" input pin, and (3) the state of the "STS1TXA_C1J1_0" input pin. ***Note:*** *This bit-field is disabled if the STS-1 Telecom Bus is disabled. The user can configure the STS-1 Telecom Bus to compute/verify with either even or odd parity, by writing the appropriate data into Bit 2 (Telecom Bus Parity – Odd), within this register.*
Bit 3	STS-1 Telecom Bus J1 ONLY	R/W	**Telecom Bus – J1 Indicator Only – Channel 0:** This READ/WRITE bit-field permits the user to configure how the STS-1 Transmit and Receive Telecom Bus interface handles the "STS1TXA_C1J1_0" and STS1RXD_C1J1_0" signals, as described below.

			"STS1TXA_C1J1_0" and STS1RXD_C1J1_0" signals, as described below. **0 – C1 and J1 Bytes** This selection configures the following. a. The STS-1 Receive Telecom Bus to pulse the "STS1RXD_C1J1_0" output coincident to whenever the C1 and J1 bytes are being output via the "STS1RXD_D_0[7:0]" output pins. b. The STS-1 Transmit Telecom Bus will expect the "STS1TXA_C1J1_0" input to pulse "high" coincident to whenever the C1 and J1 bytes are being sampled via the "STS1TXA_D_0[7:0]" input pins. **1 – J1 Bytes Only** This selection configures the following. **k.** The STS-1 Receive Telecom Bus Interface to only pulse the "STS1RXD_C1J1_0" output pin coincident to whenever the J1 byte is being output via the "STS1RXD_D_0[7:0]" output pins. ***Note:*** *The "STS1RXD_C1J1_0" output pin will NOT be pulsed "high" whenever the C1 byte is being output via the "STS1RXD_D_0[7:0]" output pins* **l.** The STS-1 Transmit Telecom Bus Interface will expect the "STS1TXA_C1J1_0" input to only pulse "high" coincident to whenever the J1 byte is being sampled via the "STS1TXA_D_0[7:0]" input pins. ***Note:*** *The "STS1TXA_C1J1_0" input pin will NOT be pulsed "high" whenever the C1 byte is being input via the "STS1TXA_D_0[7:0]" input pins*
Bit 2	STS-1 Telecom Bus Parity Odd	R/W	**Telecom Bus Parity – ODD Parity Select – Channel 0:** This READ/WRITE bit-field permits the user to configure the STS-1 Telecom Bus Interface, associated with Channel 0 to do the following. **In the Receive (Drop) Direction** Receive STS-1 Telecom Bus to compute either the EVEN or ODD parity over the contents of the (1) STS1RxD_D_0[7:0] output pins, or (2) STS1RxD_D_0[7:0] output pins, the states of the STS1RxD_PL_0 and "STS1RxD_C1J1_0 output pins (depending upon user setting for Bit 3). **In the Transmit (Add) Direction** Transmit STS-1 Telecom Bus to compute and verify the EVEN or ODD parity over the contents of the (1) STS1TxA_D_0[7:0] input pins, or (2) STS1TxA_D_0[7:0] input pins, the states of the STS1TxA_PL_0 and STS1TxA_C1J1_0 input pins (depending upon user setting for Bit 3). 0 – Configures Receive (Drop) Telecom Bus to compute EVEN parity and configures the Transmit (Add) Telecom Bus to verify EVEN parity 1 – Configures Receive (Drop) Telecom Bus to compute ODD parity and configures the Transmit (Add) Telecom Bus to verify ODD parity.
Bit 1	STS-1 Telecom Bus Parity Disable	R/W	**STS-1 Telecom Bus Parity Disable – Channel 0:** This READ/WRITE bit-field permits the user to either enable or disable parity calculation and placement via the "STSRxD_DP_0" output pin. Further, this bit field also permits the user to enable or disable parity verification via the "STS1TxA_DP_0" input pin by the Transmit Telecom Bus. 1 – Disables Parity Calculation (on the Receive Telecom Bus) and Disables Parity Verification (on the Transmit Telecom Bus.

			0 – Enables Parity Calculation and Verification
Bit 0	STS-1 REPHASE OFF	R/W	**STS-1 Telecom Bus – Rephase Disable – Channel 0:** This READ/WRITE bit-field permits the user to configure the Transmit STS-1 Telecom Bus (associated with Channel 0) to internally compute the Pointer Bytes, based upon the data that it receives via the "STS1TxA_D[7:0] input pins. ***Note:*** *If the Transmit STS-1 Telecom Bus is being provided with pulses denoting the C1 and J1 bytes (via the "STS1TxA_C1J1" input pin), then this feature is unnecessary.* 1 – Disables Rephase 0 – Enables Rephase

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	GPIO_7	R/W	**General Purpose Input/Output Pin # 7:** The exact function of this READ/WRITE bit-field depends upon whether the "GPIO_7" pin is configured to be an input or an output pin. **If GPIO_7 is configured to be an input pin:** If GPIO_7 is configured to be an input pin, then this register bit operates as a READ-ONLY bit-field that reflects the state of the "GPIO_7" (pin number AA25) input pin. If the "GPIO_7" input pin is pulled to a logic "HIGH", then this register bit will be set to "1". Conversely, if the "GPIO_7" input pin is pulled to a logic "LOW", then this register bit will be set to "0". **If GPIO_7 is configured to be an output pin:** If GPIO_7 is configured to be an output pin, then the user can control the logic level of "GPIO_7" by writing the appropriate value into this bit-field. Setting this bit-field to "0" causes the GPIO_7 output pin to be driven "LOW". Conversely, setting this bit-field to "1" causes the GPIO_7 output pin to be driven "HIGH". ***Note:*** *This register bit-field is only active if STS-1 Telecom Bus – Channel 2 is enabled.*
6	GPIO_6	R/W	**General Purpose Input/Output Pin # 6:** The exact function of this READ/WRITE bit-field depends upon whether the "GPIO_6" pin is configured to be an input or an output pin. **If GPIO_6 is configured to be an input pin:** If GPIO_6 is configured to be an input pin, then this register bit operates as a READ-ONLY bit-field that reflects the state of the "GPIO_6" (pin number W24) input pin. If the "GPIO_6" input pin is pulled to a logic "HIGH", then this register bit will be set to "1". Conversely, if the "GPIO_6" input pin is pulled to a logic "LOW", then this register bit will be set to "0". **If GPIO_6 is configured to be an output pin:** If GPIO_6 is configured to be an output pin, then the user can control the logic level of "GPIO_6" by writing the appropriate value into this bit-field. Setting this bit-field to "0" causes the GPIO_6 output pin to be driven "LOW". Conversely, setting this bit-field to "1" causes the GPIO_6 output pin to be driven "HIGH". ***Note:*** *This register bit-field is only active if STS-1 Telecom Bus – Channel 2 is enabled.*
5	GPIO_5	R/W	**General Purpose Input/Output Pin # 5:** The exact function of this READ/WRITE bit-field depends upon whether the "GPIO_5" pin is configured to be an input or an output pin.

			If GPIO_5 is configured to be an input pin: If GPIO_5 is configured to be an input pin, then this register bit operates as a READ-ONLY bit-field that reflects the state of the "GPIO_5" (pin number AC26) input pin. If the "GPIO_5" input pin is pulled to a logic "HIGH", then this register bit will be set to "1". Conversely, if the "GPIO_5" input pin is pulled to a logic "LOW", then this register bit will be set to "0". **If GPIO_5 is configured to be an output pin:** If GPIO_5 is configured to be an output pin, then the user can control the logic level of "GPIO_5" by writing the appropriate value into this bit-field. Setting this bit-field to "0" causes the GPIO_5 output pin to be driven "LOW". Conversely, setting this bit-field to "1" causes the GPIO_5 output pin to be driven "HIGH". ***Note:*** *This register bit-field is only active if STS-1 Telecom Bus – Channel 1 is enabled.*
4	GPIO_4	R/W	**General Purpose Input/Output Pin # 4:** The exact function of this READ/WRITE bit-field depends upon whether the "GPIO_4" pin is configured to be an input or an output pin. **If GPIO_4 is configured to be an input pin:** If GPIO_4 is configured to be an input pin, then this register bit operates as a READ-ONLY bit-field that reflects the state of the "GPIO_4" (pin number Y25) input pin. If the "GPIO_4" input pin is pulled to a logic "HIGH", then this register bit will be set to "1". Conversely, if the "GPIO_4" input pin is pulled to a logic "LOW", then this register bit will be set to "0". **If GPIO_4 is configured to be an output pin:** If GPIO_4 is configured to be an output pin, then the user can control the logic level of "GPIO_4" by writing the appropriate value into this bit-field. Setting this bit-field to "0" causes the GPIO_4 output pin to be driven "LOW". Conversely, setting this bit-field to "1" causes the GPIO_4 output pin to be driven "HIGH". ***Note:*** *This register bit-field is only active if STS-1 Telecom Bus – Channel 1 is enabled.*
3	GPIO_3	R/W	**General Purpose Input/Output Pin # 3:** The exact function of this READ/WRITE bit-field depends upon whether the "GPIO_3" pin is configured to be an input or an output pin. **If GPIO_3 is configured to be an input pin:** If GPIO_3 is configured to be an input pin, then this register bit operates as a READ-ONLY bit-field that reflects the state of the "GPIO_3" (pin number AB26) input pin. If the "GPIO_3" input pin is pulled to a logic "HIGH", then this register bit will be set to "1". Conversely, if the "GPIO_3" input pin is pulled to a logic "LOW", then this register bit will be set to "0". **If GPIO_3 is configured to be an output pin:** If GPIO_3 is configured to be an output pin, then the user can control the logic level of "GPIO_3" by writing the appropriate value into this bit-field. Setting this bit-field to "0" causes the GPIO_3 output pin to be driven "LOW". Conversely, setting this bit-field to "1" causes the GPIO_3 output pin to be driven "HIGH".

			Note: *This register bit-field is only active if STS-1 Telecom Bus – Channel 1 is enabled.*
2	GPIO_2	R/W	**General Purpose Input/Output Pin # 2:** The exact function of this READ/WRITE bit-field depends upon whether the "GPIO_2" pin is configured to be an input or an output pin. **If GPIO_2 is configured to be an input pin:** If GPIO_2 is configured to be an input pin, then this register bit operates as a READ-ONLY bit-field that reflects the state of the "GPIO_2" (pin number V23) input pin. If the "GPIO_2" input pin is pulled to a logic "HIGH", then this register bit will be set to "1". Conversely, if the "GPIO_2" input pin is pulled to a logic "LOW", then this register bit will be set to "0". **If GPIO_2 is configured to be an output pin:** If GPIO_2 is configured to be an output pin, then the user can control the logic level of "GPIO_2" by writing the appropriate value into this bit-field. Setting this bit-field to "0" causes the GPIO_2 output pin to be driven "LOW". Conversely, setting this bit-field to "1" causes the GPIO_2 output pin to be driven "HIGH". ***Note:*** *This register bit-field is only active if STS-1 Telecom Bus – Channel 0 is enabled.*
1	GPIO_1	R/W	**General Purpose Input/Output Pin # 1:** The exact function of this READ/WRITE bit-field depends upon whether the "GPIO_1" pin is configured to be an input or an output pin. **If GPIO_1 is configured to be an input pin:** If GPIO_1 is configured to be an input pin, then this register bit operates as a READ-ONLY bit-field that reflects the state of the "GPIO_1" (pin number AC27) input pin. If the "GPIO_1" input pin is pulled to a logic "HIGH", then this register bit will be set to "1". Conversely, if the "GPIO_1" input pin is pulled to a logic "LOW", then this register bit will be set to "0". **If GPIO_1 is configured to be an output pin:** If GPIO_1 is configured to be an output pin, then the user can control the logic level of "GPIO_1" by writing the appropriate value into this bit-field. Setting this bit-field to "0" causes the GPIO_1 output pin to be driven "LOW". Conversely, setting this bit-field to "1" causes the GPIO_1 output pin to be driven "HIGH". ***Note:*** *This register bit-field is only active if STS-1 Telecom Bus – Channel 0 is enabled.*
0	GPIO_0	R/W	**General Purpose Input/Output Pin # 0:** The exact function of this READ/WRITE bit-field depends upon whether the "GPIO_0" pin is configured to be an input or an output pin. **If GPIO_0 is configured to be an input pin:** If GPIO_0 is configured to be an input pin, then this register bit operates as a READ-ONLY bit-field that reflects the state of the "GPIO_0" (pin number W25) input pin. If the "GPIO_0" input pin is pulled to a logic "HIGH", then this register bit will be set to "1". Conversely, if the "GPIO_0" input pin is pulled to a logic "LOW", then this register bit will be set to "0".

			If GPIO_0 is configured to be an output pin: If GPIO_0 is configured to be an output pin, then the user can control the logic level of "GPIO_0" by writing the appropriate value into this bit-field. Setting this bit-field to "0" causes the GPIO_0 output pin to be driven "LOW". Conversely, setting this bit-field to "1" causes the GPIO_0 output pin to be driven "HIGH". ***Note:*** *This register bit-field is only active if STS-1 Telecom Bus – Channel 0 is enabled.*

5 – 4	Stuff Indicator Channel Select[1:0]	R/W	**Stuff Indicator – Channel Select[1:0]:** These two (2) READ/WRITE bit-fields permit the user to identify which of the 3 channels should have their "bit-stuff opportunity" status reflected on the LOF output pin. Setting these bit-fields to [0, 0] configures the LOF output pin to reflect the bit-stuff opportunity status of Channel 0. Likewise, setting these bit-fields to [1, 0] configures the LOF output pin to reflect the bit-stuff opportunity status of Channel 2. ***Note:*** *These bit-fields are ignored if any of the following are true.* *1. If the corresponding channel has been configured to operate in the STS-1 Mode.* *2. If the LOF output pin has been configured to function as the LOF or AIS-L indicator output.* *3. If the LOF output pin has been configured to function as an 8kHz output pin.*
3 – 2	Unused	R/O	
1 – 0	8kHz Source Channel Select[1:0]	R/W	**8kHz Source Channel Select[1:0]:** If the LOF output pin has been configured to output an 8kHz clock output signal, then the XRT94L33 will derive this 8kHz clock signal, from the Ingress DS3/E3 or Receive STS-1 signal of the "Selected" channel. These two(2) READ/WRITE bit-fields permit the user to specify the "Selected" channel. Setting these bit-fields to [0, 0] configures the LOF output pin to output an 8kHz clock signal, that is derived from the Ingress DS3/E3 or Receive STS-1 input signal of Channel 0. Likewise, setting these bit-fields to [1, 0] configures the LOF output pin to reflect the bit-stuff opportunity status of Channel 2. ***Note:*** *These bit-fields are ignored if any of the following are true.* *1. If the LOF output pin has been configured to function as the LOF or AIS-L indicator output.* *2. If the LOF output pin has been configured to function as the "Stuff Indicator" output pin.*

Table 37: Operation Slow Speed Port Control Register – Byte 1 (Address Location= 0x0154)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
SSI Port Enable	SSI Port – Insert Direction	SSI Port - Force All Zeros Pattern	Unused	SSE Port Enable	SSE Port – Insert Direction	SSE Port - Force All Zeros Pattern	Unused
R/W	R/W	R/W	R/O	R/W	R/W	R/W	R/O
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	SSI Port Enable	R/W	**Slow-Speed Ingress – Interface Port Enable:** This READ/WRITE bit-field permits the user to enable or disable the SSI (Slow-Speed Ingress) Interface Port. If the SSI Interface port is enabled, then it can be used to do either of the following. • To monitor (e.g., to drop out a replica of) the DS3, E3 or STS-1 signal, that is traveling in the Ingress Direction DS3/E3 or Receive STS-1 path of the "Selected" channel within the XRT94L33 device. • To insert (e.g., to add-in) and overwrite the DS3, E3 or STS-1 signal, that is traveling in the Ingress Direction DS3/E3 or Receive STS-1 path of the "Selected" Channel within the XRT94L33 device. 0 – Disables the SSI Interface Port. 1 – Enables the SSI Interface Port.
6	SSI Port – Insert Direction	R/W	**Slow-Speed Ingress – Interface Port – Insert Direction:** This READ/WRITE bit-field permits the user to configure the SSI Interface port to either monitor (e.g., extract) an "Ingress Direction DS3/E3" or "Receive STS-1" signal, or to replace (e.g., insert) a DS3, E3 or STS-1 signal into the Ingress DS3/E3 or Receive STS-1 path of the "Selected" channel. If the user configures the SSI Interface port to monitor a given DS3, E3 or STS-1 signal, then the SSI Interface will then be configured to be an "output" interface. In this case, the SSI Interface port will consist of an "SSI_POS", "SSI_NEG" and "SSI_CLK" output signals. Additionally, a copy of the Selected Ingress Direction DS3/E3 or Receive STS-1 signal will be output via this output port. If the user configures the SSI Interface port to replace (e.g., insert) an "Ingress DS3/E3" or Receive STS-1 signal, then the SSI Interface will then be configured to be an "input" interface. In this case, the SSI Interface port will consist of an "SSI_POS", "SSI_NEG" and "SSI_CLK" input signals. Additionally, the DS3, E3 or STS-1 signal that is applied at this input port will overwrite that of the selected "Ingress Direction DS3/E3" or the Receive STS-1 signal. 0 – Configures the SSI Interface as an output port that will permit the user to monitor the "selected" Ingress DS3/E3 or Receive STS-1 signal. 1 – Configures the SSI Interface as an input port. In this configuration, the DS3, E3 or STS-1 signal that is input via this port will replace/overwrite the "Ingress" DS3/E3 or Receive STS-1 signal, within the "selected" channel, prior to being mapped into STS-3. ***Note:*** *This bit-field will be ignored if the SSI Interface port is disabled.*

5	SSI Port - Force All Zeros Pattern	R/W	**Slow Speed Ingress – Interface Port – Force All Zeros Pattern:** This READ/WRITE bit-field permits the user to force the Ingress DS3/E3 or Receive STS-1 signal, within the "selected" channel to an "All Zeros" pattern. 0 – Configures the Selected Ingress Direction DS3/E3 or Receive STS-1 signal (within the "selected" channel) to flow to the DS3/E3 Mapper Block or to the Transmit SONET POH Processor block, in a normal manner. 1 – Forces the data, within the Selected Ingress Direction DS3/E3 or Receive STS-1 signal (within the "selected" channel) to an "All Zeros" pattern. ***Note:*** *This bit-field will be ignored if the SSI Interface port is disabled.*
4	Unused	R/O	
3	SSE Port Enable	R/W	**Slow-Speed Egress – Interface Port Enable:** This READ/WRITE bit-field permits the user to enable or disable the SSE (Slow Speed Egress) Interface Port. If the SSE Interface port is enabled, then it can be used to do either of the following. • To monitor (e.g., to drop out a replica of) the DS3, E3 or STS-1 signal, that is traveling in the Egress Direction DS3/E3 or Transmit STS-1 path of the "Selected" channel within the XRT94L33 device. • To insert (e.g., to add in) and overwrite the DS3, E3 or STS-1 signal, that is traveling in the Engress Direction DS3/E3 or Transmit STS-1 path of the "Selected" Channel within the XRT94L33 device. 0 – Disables the SSE Interface Port 1 – Enables the SSE Interface Port.
2	SSE Port – Insert Direction	R/W	**Slow Speed Egress – Interface Port – Insert Direction:** This READ/WRITE bit-field permits the user to configure the SSE Interface port to either monitor (e.g., extract) an "Egress Direction DS3/E3" or "Transmit STS-1" signal, or to replace (e.g., insert) a DS3, E3 or STS-1 signal into the Egress Direction DS3/E3 or Transmit STS-1 path of the "Selected" channel. If the user configures the SSE Interface port to monitor a given DS3, E3 or STS-1 signal, then the SSE Interface wil then be configured to be an "output" interface. In this case, the SSE Interface port will consist of an "SSE_POS", "SSE_NEG" and "SSE_CLK" output signals. Additionally, a copy of the Selected Egress Direction DS3/E3 or Transmit STS-1 signal will be output via this output port. If the user configures the SSE Interface port to replace (e.g., insert) an "Egress DS3/E3" or Transmit STS-1 signal, then the SSE Interface will then be configured to be an "input" interface. In this case, the SSE Interface port will consist of an "SSE_POS", "SSE_NEG" and "SSE_CLK" input signals. Additionally, the DS3, E3 or STS-1 signal, that is applied at this input port will overwrite that of the selected "Egress Direction DS3/E3" or the Transmit STS-1 signal. 0 – Configures the SSE Interface as an output port that will permit the user to monitor the "selected" Egress DS3/E3 or Transmit STS-1 signal.. 1 – Configures the SSE Interface as an input port. In this configuration, the DS3, E3 or STS-1 signal that is input via this port will replace/overwrite the "Egress" DS3/E3 or Transmit STS-1 signal, within the "selected" channel, prior to being mapped into STS-3.

			Note: *This bit-field will be ignored if the SSE Interface port is disabled.*
1	SSE Port - Force All Zeros Pattern	R/W	**Slow Speed Egress – Interface Port – Force to All Zeros:** This READ/WRITE bit-field permits the user to force the Egress DS3/E3 or Transmit STS-1 signal, within the "selected" channel to an "All Zeros" pattern. 0 – Configures the Selected Egress Direction DS3/E3 or Transmit STS-1 signal (within the "selected" channel) to flow to the DS3/E3/STS-1 LIU IC in a normal manner. 1 – Forces the data, within the Selected Egress Direction DS3/E3 or Transmit STS-1 signal (within the "selected" channel) to an "All Zeros" pattern. ***Note:*** *This bit-field will be ignored if the SSE Interface port is disabled.*

0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	APS Group Enable	R/W	**APS Group Enable:** This register bit is only active if the XRT94L33 device has been configured to operate in either the ATM UNI or PPP over STS-3c Mode. This register bit is not active for Aggregation Applications.
6	Invoke Payload APS	R/W	**Invoke Payload APS:** This register bit is only active if the XRT94L33 device has been configured to operate in either the ATM UNI or PPP over STS-3c Mode. This register bit is not active for Aggregation Applications.
5	Protection Channel Timing Source	R/W	**Protection Channel Timing Source:** This register bit is only active if the XRT94L33 device has been configured to operate in either the ATM UNI over PPP over STS-3c Mode. This register bit is not active for Aggregation Applications.
4	Receive Payload Bypass	R/W	**Receive Payload Bypass:** This READ/WRITE bit-field permits the user to bypass the receive payload of protection channel. 0 – Receive payload is not bypassed. 1 – Receive payload is bypassed.

3	APS Group Reset	R/W	**APS Group Reset:** This register bit is only active if the XRT94L33 device has been configured to operate in either the ATM UNI or PPP over STS-3c Mode. This register bit is not active for Aggregation Applications.
2	Line Port In Use	R/O	**Line Port In Use:** This READ-ONLY bit-field permits the user to check and identify which Receive STS-3/STM-1 PECL Interface Port is currently being used to receive the incoming STS-3/STM-1 data 0 – Indicates that the Primary Receive STS-3/STM-1 PECL Interface Port is the "current port in use". 1 – Indicates that the Redundant Receive STS-3/STM-1 PECL Interface Port is the "current port in use."
1	Line APS Auto Switch Enable	R/W	**Line APS Auto Switch Enable:** This READ/WRITE bit-field permits the user to configure the XRT94L33 to automatically switch from the "Primary" to the "Redundant" port, whenever the Primary Receive STS-3 TOH Processor block declares the LOS (Loss of Signal) defect condition. 0 – Disables the APS Auto Switch feature. In this mode, the XRT94L33 will not automatically switch from the "Primary" port to the "Redundant" port, whenever the Primary Receive STS-3 TOH Processor block declares the LOS defect condition. 1 – Enables the APS Auto Switch feature. In this mode, the XRT94L33 device will automatically switch from the "Primary" port to the "Redundant" port, whenever the Primary STS-3 TOH Processor block declares the LOS defect condition. **NOTE:** This "APS Auto Switch" feature cannot be used to support "revertive" switching (e.g., switching from the Redundant to the Primary Port whenever the Redundant Receive STS-3 TOH Processor block declares the LOS defect condition).
0	Line APS Switch	R/W	**Line APS Switch:** This READ/WRITE bit-field permits the user to command a Line APS switch (from one port to the other) via software control. 0 – Configures each of the three (3) Receive SONET POH Processor blocks to accept the incoming SONET traffic from the Primary Receive STS-3 TOH Processor block. 1 – Configures each of the three (3) Receive SONET POH Processor blocks to accept the incoming SONET traffic from the Redundant Receive STS-3 TOH Processor block.

1.3 LINE INTERFACE CONTROL BLOCK

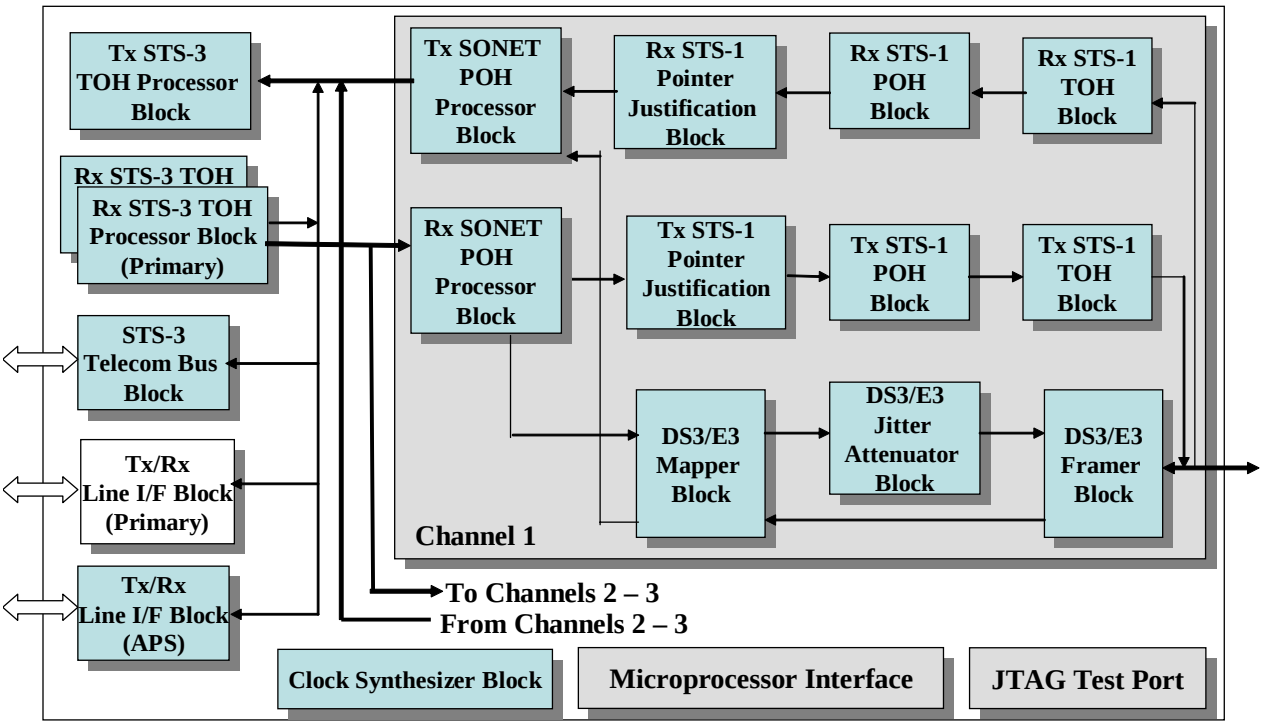
The register map for the Line Interface Control block is presented in the Table below. Additionally, a detailed description of each of the "Line Interface Control" Block registers is presented below.

The Line Interface Control Block registers provide the user with "Command and Control" over the following functional blocks.

- The Transmit STS-3/STM-1 PECL Interface block
- The Receive STS-3/STM-1 PECL Interface block
- The Clock Synthesizer Block

In order to provide some orientation for the reader, an illustration of the Functional Block Diagram for the XRT94L33 device, with each of these "above-mentioned" functional blocks "highlighted" is presented below in Figure 1.

Figure 1: Illustration of the Functional Block Diagram of the XRT94L33 (whenever it has been configured to operate in the 3-Channel DS3/STS-1 to STS-3 Mapper Mode, with the Line-Interface-related blocks "High-lighted".



1.3.1 LINE INTERFACE CONTROL REGISTER

Table 55: Line Interface Control Register – Address Map

ADDRESS LOCATION	REGISTER NAME	DEFAULT VALUES
0x0302	Receive Line Interface Control Register – Byte 1	0x00
0x0303	Receive Line Interface Control Register – Byte 0	0x00
0x0304 – 0x0306	Reserved	0x00
0x0307	Receive Line Status Register	0x00
0x0308 -0x030A	Reserved	0x00
0x030B	Receive Line Interrupt Register	0x00
0x030C – 0x030E	Reserved	0x00
0x030F	Receive Line Interrupt Enable Register	0x00
0x0310 – 0x0382	Reserved	0x00
0x0383	Transmit Line Interface Control Register	0x00

1.3.2 LINE INTERFACE CONTROL REGISTER DESCRIPTION

Table 56: Receive Line Interface Control Register – Byte 1 (Address Location= 0x0302)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused	STS-3 Loop-timing Mode	Split Loop Back	Unused	Remote Serial Loop Back	Unused	Analog Local Loop Back Enable	Digital Local Loop Back Enable
R/W	R/W	R/W	R/O	R/W	R/O	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Unused	R/O	
6	STS-3 Loop Timing Mode	R/W	**STS-3 Loop-Timing Mode:** This READ/WRITE bit-field permits the user to configure the 94L33 to operate in the Loop-timing Mode. If the user implements this configuration, then the following Transmit STS-3-related functional blocks will use the "Recovered Clock" (Receive STS-3 timing) as its timing source. • All three (3) Transmit SONET POH Processor blocks • The Transmit STS-3c POH Processor block (if enabled) • The Transmit STS-3 TOH Processor block • The Transmit STS-3 PECL Interface block • The Transmit STS-3 Telecom Bus Interface Block. 0 – Configures all of the Transmit STS-3 circuitry to operate in the "Local-Timing" Mode (e.g., the above-mentioned functional blocks will use the Clock Synthesizer block as its timing source). 1 – Configures the Transmit STS-3 circuitry to operate in the "Loop-Timing" Mode.
5	Split Loop Back	R/W	**Split Loop-back Enable:** This READ/WRITE bit-field permits the user to configure the 94L33 to operate in the "Split Loop-back" Mode. If the user implements this configuration, then two types of loop-backs will exist within the chip simultaneously. a. A Local Loop-back This loop-back path will originate from the Transmit STS-3 TOH Processor block. It will be routed through a portion of the "Transceiver circuitry" (through the "Transmit Parallel-to-Serial Converter" block) and then back to the "Receive Serial-to-Parallel Converter" block, before being routed to the Receive STS-3 TOH Processor block. b. A Remote Loop-back This loop-back path will originate from the Receive STS-3/STM-1 PECL Interface input. It will be routed through the CDR (Clock & Data Recovery) block; before being routed to the Transmit STS-3/STM-1 PECL Interface output. 0 – Configures the 94L33 to NOT operate in the Split Loop-back Mode 1 – Configures the 94L33 to operate in the Split Loop-back Mode

4	Unused	R/W	
3	Remote Serial Loop Back		**Remote Serial Loop-back Enable:** This READ/WRITE bit-field permits the user to configure the 94L33 to operate in the "Remote Serial Loop-back" Mode. In this mode, the incoming (Received Data) will enter the device via the Receive STS-3/STM-1 PECL Interface Input. This signal will then be processed via the CDR (Clock and Data Recovery) Block. At this point, this input signal will proceed via two paths in parallel. In one path, the signal will proceed onto the "Receive Serial-to-Parallel" Converter and then the Receive STS-3 TOH Processor block (and so on). The other path will not proceed through the "Receive Serial-to Parallel" Converter block. Instead this signal will proceed on towards the "Transmit STS-3/STM-1 PECL Interface Output, thereby completing the loop-back path. 0 – Configures the 94L33 to NOT operate in the Remote Serial Loop-back Mode. 1 – Configures the 94L33 to operate in the Remote Serial Loop-back Mode.
2	Unused	R/O	
1	Analog Local Loop Back Enable	R/W	**Analog Local Loop Back:** This READ/WRITE bit field permits the user to configure the 94L33 to operate in the "Analog Local Loop Back" Mode. If the user implements this configuration, analog local loop back including data and clock recovery will be enabled. 0 – Analog local loop back is disabled 1 – Analog local loop back is enabled
0	Digital Local Loop Back Enable	R/W	**Digital Local Loop Back:** This READ/WRITE bit field permits the user to configure the 94L33 to operate in the "Digital Local Loop Back" Mode. If the user implements this configuration, digital local loop back NOT including data and clock recovery will be enabled. 0 – Digital local loop back is disabled 1 – Digital local loop back is enabled

Table 57: Receive Line Interface Control Register – Byte 0 Address Location= 0x0303)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Primary Receive STS-3/STM-1 PECL Interface Module Power Down	Redundant Receive STS-3/STM-1 PECL Interface Module Power Down	Force Training Mode Upon LOS	Unused				
R/W	R/W	R/W	R/O	R/O	R/O	R/O	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Primary Receive STS-3/STM-1 PECL Interface Module Power Down	R/W	**Primary Receive STS-3/STM-1 PECL Interface Module Power Down:** This READ/WRITE bit field permits the user to power down the Primary Receive STS-3/STM-1 PECL Interface Port as described below. 0 – Powers on Primary Receive STS-3/STM-1 PECL Interface block. 1 – Powers down the Primary Receive STS-3/STM-1 PECL Interface block. In this mode, the user will not be able to receive STS-3/STM-1 data via the Primary Receive PECL Interface port. **NOTE:** If the user wishes to configure the XRT94L33 device to receive STS-3/STM-1 data via the Primary Receive STS-3/STM-1 PECL Interface port, then he/she MUSTset this bit-field to "0".
6	Redundant Receive STS-3/STM-1 PECL Interface Module Power Down	R/W	**Redudant Receive STS-3/STM-1 PECL Interface Module Power Down:** This READ/WRITE bit field permits the user to power down the Redundant Receive STS-3/STM-1 PECL Interface Port as described below. 0 – Powers on the Redundant Receive STS-3/STM-1 PECL Interface block. 1 – Powers down the Redundant Receive STS-3/STM-1 PECL Interface block. In this mode, the user will not be able to receive STS-3/STM-1 data via the Redundant Receive PECL Interface port. **NOTE:** If the user wishes to configure the XRT94L33 device to receive STS-3/STM-1 data via the Redundant Receive STS-3/STM-1 PECL Interface port, then he/she MUST set this bit-field to "0".
5	Force Training Mode Upon LOS	R/W	**Force Training Mode Upon LOS:** This READ/WRITE bit field permits the user to configure the Receive STS-3/STM-1 PECL Interface – CDR (Clock and Data Recovery) phase lock loop to stay in training mode as long as the external LOS is asserted. If the user implements this feature, then the Receive STS-3/STM-1 PECL Interface block CDR PLL will lock onto a clock signal that is ultimately derived from the REFCLK input pin and remain locked onto this signal for the duration that the Receive STS-3/STM-1 PECL Interface block is declaring the LOS_Detect condition. 0 – Receive Line Interface PLL will NOT stay in training mode 1 – Receive Line Interface PLL will stay in training mode
4-0	Unused	R/O

0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Primary Transmit STS-3/STM-1 PECL Interface Enable	R/W	**Primary Transmit STS-3/STM-1 PECL Interface Enable:** This READ/WRITE bit field permits the user to enable or disable the Transmit STS-3/STM-1 PECL Interface output drivers as described below. 0 – Disables the Transmit STS-3/STM-1 PECL Interface output drivers. 1 – Enables the Transmit STS-3/STM-1 PECL Interface output drivers. NOTE: The user MUST set this bit-field to "1" in order to transmit any traffic via the Transmit STS-3/STM-1 PECL Interface output.
6	Transmit Clock Enable	R/W	**Transmit Clock Enable:** This READ/WRITE bit field permits the user to enable or disable the transmitter clock output. 0 – Disables transmitter clock output 1 – Enables transmitter clock output
5	Clock Synthesizer as Timing Source	R/W	**Clock Synthesizer as Timing Source:** This READ/WRITE bit field permits the user to select either the Clock Synthesizer block or the signal applied at the REFTTL input as the source of the Transmit 19.44MHz clock. 0 – This setting configures the "Transmit SONET" circuitry to by-pass the Clock Synthesizer block and to directly use the 19.44MHz clock signal (that is provided to the REFTTL input pin) as its timing source. In this case, the "Clock Synthesizer" block is by-passed. 1 – This setting configures the "Transmit SONET" circuitry to use the output of the Clock Synthesizer block as its timing source. **NOTE:** If the user opts to by-pass the Clock Synthesizer (by setting this register bit to "0") then he/she MUST apply a 19.44MHz clock signal to the REFTTL input pin.
4	Redundant Transmit STS-3/STM-1 PECL Interface Enable	R/W	**Redundant Transmit STS-3/STM-1 PECL Interface Enable:** This READ/WRITE bit field permits the user to enable or disable the Redundant Transmit STS-3/STM-1 PECL Interface output pads. If the user enables the "Redundant Transmit STS-3/STM-1 PECL Interface" block, then it will begin to transmit the exact same data as is the "Primary Transmit STS-3/STM-1 PECL Interface" block. 0 – Disables the Redundant Transmit STS-3/STM-1 PECL Interface block 1 – Enables the Redundant Transmit STS-3/STM-1 PECL Interface block

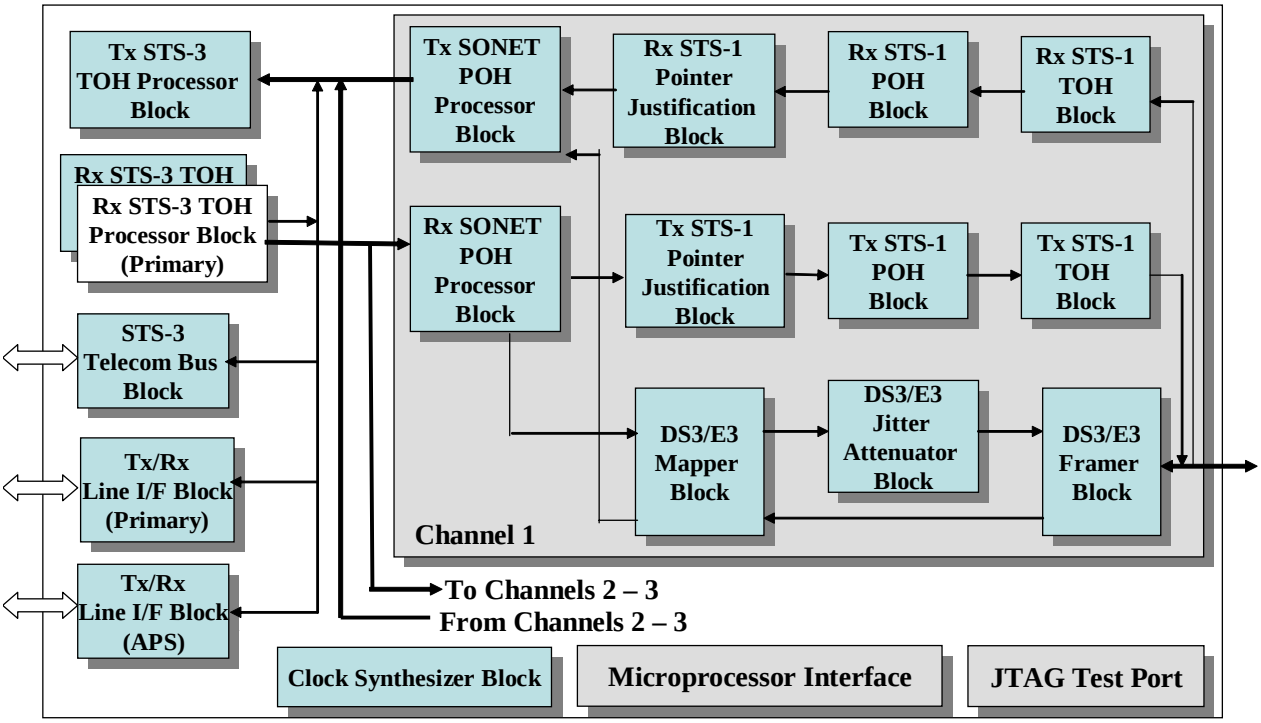
			NOTE: If the user wishes to use the "Line APS" features within the XRT94L33 device, then he/she MUST enable the "Redundant Transmit STS-3/STM-1PECL Interface block.
3	Unused	R/W	**Serial Loopback:** This READ/WRITE bit field permits the user to enable or disable serial loopback. 0 – Disables Serial loopback 1 – Enables Serial loopback
2	Unused	R/O	
1-0	Clock Synthesizer Block Frequency Select[1:0]	R/W	**Clock Synthesizer Block Frequency Select[1:0]:** This READ/WRITE bit field permits the user to select the desired reference clock speed as follows: 00 = 19.44 MHz 01 = 38.88 MHz 10 = 51.85 MHz 11 = 77.76 MHz

1.4 RECEIVE STS-3 TOH PROCESSOR BLOCK

The register map for the Receive STS-3 TOH Processor Block is presented in the Table below. Additionally, a detailed description of each of the "Receive STS-3 TOH Processor" Block registers is presented below.

In order to provide some orientation for the reader, an illustration of the Functional Block Diagram for the XRT94L33, with the "Receive STS-3 TOH Processor Block "highlighted" is presented below in Figure 2

Figure 2: Illustration of the Functional Block Diagram of the XRT94L33 (whenever it has been configured to operate in the 3-Channel DS3/STS-1 to STS-3 Mapper Mode), with the Receive STS-3 TOH Processor Block "High-lighted".



RECEIVE STS-3 TOH PROCESSOR BLOCK REGISTERS

Table 62: Receive STS-3 TOH Processor Block Control Register – Address Map

ADDRESS LOCATION	REGISTER NAME	DEFAULT VALUES
0x1000 – 0x1102	Reserved	
0x1103	Receive STS-3 Transport Control Register – Byte 0	0x00
0x1104 – 0x1105	Reserved	0x00
0x1106	Receive STS-3 Transport Status Register – Byte 1	0x00
0x1107	Receive STS-3 Transport Status Register – Byte 0	0x02
0x1108	Reserved	0x00
0x1109	Receive STS-3 Transport Interrupt Status Register – Byte 2	0x00
0x110A	Receive STS-3 Transport Interrupt Status Register – Byte 1	0x00
0x110B	Receive STS-3 Transport Interrupt Status Register – Byte 0	0x00
0x110C	Reserved	0x00
0x110D	Receive STS-3 Transport Interrupt Enable Register – Byte 2	0x00
0x110E	Receive STS-3 Transport Interrupt Enable Register – Byte 1	0x00
0x110F	Receive STS-3 Transport Interrupt Enable Register – Byte 0	0x00
0x1110	Receive STS-3 Transport - B1 Byte Error Count Register – Byte 3	0x00
0x1111	Receive STS-3 Transport - B1 Byte Error Count Register – Byte 2	0x00
0x1112	Receive STS-3 Transport - B1 Byte Error Count Register – Byte 1	0x00
0x1113	Receive STS-3 Transport - B1 Byte Error Count Register – Byte 0	0x00
0x1114	Receive STS-3 Transport - B2 Byte Error Count Register – Byte 3	0x00
0x1115	Receive STS-3 Transport - B2 Byte Error Count Register – Byte 2	0x00
0x1116	Receive STS-3 Transport - B2 Byte Error Count Register – Byte 1	0x00
0x1117	Receive STS-3 Transport - B2 Byte Error Count Register – Byte 0	0x00
0x1118	Receive STS-3 Transport - REI-L Event Count Register – Byte 3	0x00
0x1119	Receive STS-3 Transport - REI-L Event Count Register – Byte 2	0x00
0x111A	Receive STS-3 Transport - REI-L Event Count Register – Byte 1	0x00
0x111B	Receive STS-3 Transport - REI-L Event Count Register – Byte 0	0x00
0x111E	Reserved	0x00
0x111F	Receive STS-3 Transport K1 Byte Value Register	0x00
0x1120 – 0x1122	Reserved	0x00
0x1123	Receive STS-3 Transport K2 Byte Value Register	0x00
0x1124 – 0x1126	Reserved	0x00
0x1127	Receive STS-3 Transport S1 Byte Value Register	0x00

ADDRESS LOCATION	REGISTER NAME	DEFAULT VALUES
0x1128 – 0x112A	Reserved	0x00
0x112B	Receive STS-3 Transport – In-Sync Threshold Value Register	0x00
0x112C, 0x112D	Reserved	0x00
0x112E	Receive STS-3 Transport – LOS Threshold Value – MSB	0xFF
0x112F	Receive STS-3 Transport – LOS Threshold Value – LSB	0xFF
0x1130	Reserved	0x00
0x1131	Receive STS-3 Transport – SF Set Monitor Interval – Byte 2	0x00
0x1132	Receive STS-3 Transport – SF Set Monitor Interval – Byte 1	0x00

1.4.1 RECEIVE STS-3 TOH PROCESSOR BLOCK REGISTER DESCRIPTION

Table 63: Receive STS-3 Transport Control Register – Byte 0 (Address Location= 0x1103)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
STS-N OH Extract	SF Defect Condition Detect Enable	SD Defect Condition Detect Enable	Descramble Disable	SDH/ SONET*	REI-L Error Type	B2 Error Type	B1 Error Type
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	STS-N OH Extract	R/W	**STS-N Overhead Extract (Revision C Silicon Only):** This READ/WRITE bit-field permits the user to configure the RxTOH output port to output the TOH for all lower-tributary STS-1s within the incoming STS-3 signal. 0 – Disables this feature. In this mode, the RxTOH output port will only output the TOH for the first STS-1 within the incoming STS-3 signal. 1 – Enables this feature.
6	SF Defect Condition Detect Enable	R/W	**Signal Failure (SF) Defect Condition Detect Enable:** This READ/WRITE bit-field permits the user to enable or disable SF Defect Declaration and Clearance by the Receive STS-3 TOH Processor Block, as described below. 0 – Configures the Receive STS-3 TOH Processor block to NOT declare nor clear the SF defect condition per the “user-specified” SF defect declaration and clearance criteria. 1 – Configures the Receive STS-3 TOH Processor block to declare and clear the SF defect condition per the “user-specified” SF defect declaration and clearance” criteria. **NOTE:** The user must set this bit-field to “1” in order to permit the Receive STS-3 TOH Processor block to declare and clear the SF defect condition.
5	SD Defect Condition Detect Enable	R/W	**Signal Degrade (SD) Defect Condition Detect Enable:** This READ/WRITE bit-field permits the user to enable or disable SD Declaration and Clearance by the Receive STS-3 TOH Processor Block as described below. 0 – Configures the Receive STS-3 TOH Processor blolck to NOT declare nor clear the SD defect condition per the “user-specified” SD defect declaration and clearance criteria.. 1 – Configures the Receive STS-3 TOH Processor block to declare and clear the SD defect condition per the “user-specified SD defect declaration and clearance” critieria. **NOTE:** The user must set this bit-field to “1” in order to permit the Receive STS-3 TOH Processor block to declare and clear the SD defect condition.
4	Descramble Disable	R/W	**De-Scramble Disable:** This READ/WRITE bit-field permits the user to either enable or disable de-scrambling by the Receive STS-3 TOH Processor block. 0 – De-Scrambling is enabled.

			1 – De-Scrambling is disabled.
3	SDH/SONET*	R/W	**SDH/SONET Select:** This READ/WRITE bit-field permits the user to configure the XRT94L33 device to operate in either the SONET or SDH Mode. 0 – Configures the XRT94L33 device to operate in the SONET Mode. 1 – Configures the XRT94L33 device to operate in the SDH Mode.
2	REI-L Error Type	R/W	**REI-L (Line – Remote Error Indicator) Error Type:** This READ/WRITE bit-field permits the user to specify how the Receive STS-3 TOH Processor block will count (or tally) REI-L events, for Performance Monitoring purposes. The user can configure the Receive STS-3 TOH Processor block to increment REI-L events on etiher a "per-bit" or "per-frame" basis. If the user configures the Receive STS-3 TOH Processor block to increment REI-L events on a "per-bit" basis, then it will increment the "Receive STS-3 Transport REI-L Event Count" register by the contents within the M1 byte of the incoming STS-3 data-stream. If the user configures the Receive STS-3 TOH Processor block to increment REI-L events on a "per-frame" basis, then it will increment the "Receive STS-3 Transport REI-L Event Count" register each time it receives an STS-3 frame, in which the M1 byte is set to a "non-zero" value. 0 – Configures the Receive STS-3 TOH Processor block to count or tally REI-L events on a per-bit basis. 1 – Configures the Receive STS-3 TOH Processor block to count or tally REI-L events on a per-frame basis.
1	B2 Error Type	R/W	**B2 Error Type:** This READ/WRITE bit-field permits the user to specify how the "Receive STS-3 TOH Processor block will count (or tally) B2 byte errors, for Performance Monitoring purposes. The user can configure the Receive STS-3 TOH Processor block to increment B2 byte errors on either a "per-bit" or a "per-frame" basis. If the user configures the Receive STS-3 TOH Processor block to increment B2 byte errors on a "per-bit" basis, then it will increment the Receive STS-3 Transport - B2 Byte Error Count" register by the number of bits (within each of the three B2 byte values) that is in error. If the user configures the Receive STS-3 TOH Processor block to increment B2 byte errors on a "per-frame" basis, then it will increment the "Receive STS-3 Transport - B2 Byte Error Count" Register, each time it receives an STS-3 frame that contains at least one erred B2 byte. 0 – Configures the Receive STS-3 TOH Processor block to count B2 byte errors on a "per-bit" basis. 1 – Configures the Receive STS-3 TOH Processor block to count B2 byte errors on a "per-frame" basis.
0	B1 Error Type	R/W	**B1 Error Type:** This READ/WRITE bit-field permits the user to specify how the Receive STS-3 TOH Processor block will count (or tally) B1 byte errors, for Performance Monitoring purposes. The user can configure the Receive STS-3 TOH Processor block to increment B1 byte errors on either a "per-bit" or "per-frame" basis. If the user configures the Receive STS-3 TOH Processor block to increment B1 byte errors on a "per-bit" basis, then it will increment the "Receive Transport B1 Error Count" register by the number of bits (within the B1 byte value) that is in error. If the user configures the Receive STS-3 TOH Processor block to increment B1 byte errors on a "per-frame" basis, then it will increment the

			"Receive STS-3 Transport - B1 Byte Error Count" Register each time it receives an STS-3 frame that contains an erred B1 byte. 0 – Configures the Receive STS-3 TOH Processor block to count B1 byte errors on a "per-bit" basis. 1 – Configures the Receive STS-3 TOH Processor block to count B1 byte errors on a "per-frame" basis.

Table 64: Receive STS-3 Transport Status Register – Byte 1 (Address Location= 0x1106)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused					Section Trace Message Mismatch Defect Declared	Section Trace Message Unstable Defect Declared	AIS-L Defect Declared
R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 3	Unused	R/O	
2	Section Trace Message Mismatch Defect Declared	R/O	**Section Trace Message Mismatch Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-3 TOH Processor block is currently declaring the Section Trace Mismatch defect condition within the incoming STS-3 data-stream. The Receive STS-3 TOH Processor block will declare the Section Trace Message Mismatch defect condition, whenever it accepts a Section Trace Message (via the J0 byte, within the incoming STS-3 data-stream) that differs from the "Expected Section Trace Message". 0 – Indicates that the Receive STS-3 TOH Processor block is NOT currently declaring the Section Trace Message Mismatch Defect Condition. 1 – Indicates that the Receive STS-3 TOH Processor block is currently declaring the Section Trace Message Mismatch Defect Condition.
1	Section Trace Message Unstable Defect Declared	R/O	**Section Trace Message Unstable Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-3 TOH Processor block is currently declaring the Section Trace Message Unstable Defect condition. The Receive STS-3 TOH Processor block will declare the Section Trace Message Unstable defect condition, whenever the "Section Trace Message Unstable" counter reaches the value 8. The Receive STS-3 TOH Processor block will increment the "Section Trace Message Unstable" counter each time that it receives a Section Trace message that differs from the previously received Section Trace Message". The Receive STS-3 TOH Processor block will clear the "Section Trace Message Unstable" counter to "0" whenever it has received a given Section Trace Message 3 (or 5) consecutive times. ***Note:*** *The Receive STS-3 TOH Processor block will also clear the "Section Trace Message Unstable" defect condition" once it has received a given Section Trace Message 3 (or 5) consecutive times.* 0 – Indicates that the Receive STS-3 TOH Processor block is NOT currently declaring the Section Trace Message Unstable defect condition. 1 – Indicates that the Receive STS-3 TOH Processor block is currently declaring the Section Trace Message Unstable defect condition.
0	AIS-L Defect Declared	R/O	**AIS-L Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-3 TOH Processor block is currently declaring the AIS-L (Line AIS) defect condition within the incoming STS-3 data stream. The Receive STS-3 TOH Processor block will declare the AIS-L defect condition within the incoming STS-3 data stream if bits 6, 7 and 8 (e.g., the Least Significant Bits, within the K2 byte) are set to the value "[1, 1, 1]" for five consecutive STS-3

			frames. 0 – Indicates that the Receive STS-3 TOH Processor block is NOT currently declaring the AIS-L defect condition. 1 – Indicates that the Receive STS-3 TOH Processor block currently declaring the AIS-L defect condition.

Table 65: Receive STS-3 Transport Status Register – Byte 0 (Address Location= 0x1107)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
RDI-L Defect Declared	S1 Byte Unstable Defect Declared	K1, K2 Byte Unstable Defect Declared	SF Defect Declared	SD Defect Declared	LOF Defect Declared	SEF Defect Declared	LOS Defect Declared
R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	RDI-L Defect Declared	R/O	**RDI-L (Line Remote Defect Indicator) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-3 TOH Processor block is currently declaring the RDI-L defect condition within the incoming STS-3 signal. The Receive STS-3 TOH Processor block will declare the RDI-L defect condition whenever it determines that bits 6, 7 and 8 (e.g., the three least significant bits) of the K2 byte contains the "1, 1, 0" pattern in 5 consecutive incoming STS-3 frames. 0 – Indicates that the Receive STS-3 TOH Processor block is NOT currently declaring the RDI-L defect condition. 1 – Indicates that the Receive STS-3 TOH Processor block is currently declaring the RDI-L defect condition.
6	S1 Byte Unstable Defect Declared	R/O	**S1 Byte Unstable Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-3 TOH Processor block is currently declaring the "S1 Byte Unstable" defect condition. The Receive STS-3 TOH Processor block will declare the "S1 Byte Unstable" defect condition whenever the "S1 Byte Unstable Counter" reaches the value 32. The Receive STS-3 TOH Processor block will increment the "S1 Byte Unstable Counter" each time that it receives an STS-3 frame that contains an S1 byte that differs from the previously received S1 byte. The Receive STS-3 TOH Processor block will clear the contents of the "S1 Byte Unstable Counter" to "0" whenever it receives the same S1 byte for 8 consecutive STS-3 frames. 0 – Indicates that the Receive STS-3 TOH Processor block is NOT currently declaring the "S1 Byte Unstable Defect Condition. 1 – Indicates that the Receive STS-3 TOH Processor block is currently declaring "S1 Byte Unstable Defect Condition.
5	K1, K2 Byte Unstable Defect Declared	R/O	**K1, K2 Byte Unstable Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-3 TOH Processor block is currently declaring the "K1, K2 Byte Unstable" defect condition. The Receive STS-3 TOH Processor block will declare the "K1, K2 Byte Unstable" defect condition whenever it fails to receive the same set of K1, K2 bytes, in 12 consecutive STS-3 frames. The Receive STS-3 TOH Processor block will clear the "K1, K2 Byte Unstable" defect condition whenever it receives a given set of K1, K2 byte values within three consecutive STS-3 frames. 0 – Indicates that the Receive STS-3 TOH Processor block is NOT currently declaring the K1, K2 Byte Unstable Defect Condition. 1 – Indicates that the Receive STS-3 TOH Processor block is currently declaring the K1, K2 Byte Unstable Defect Condition.
4	SF Defect Declared	R/O	**SF (Signal Failure) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-3 TOH

			Processor block is currently declaring the SF defect condition. The Receive STS-3 TOH Processor block will declare the SF defect condition anytime it has determined that the number of B2 byte errors (measured over a user-selected period of time) exceeds a certain "user-specified B2 Byte Error" threshold. 0 – Indicates that the Receive STS-3 TOH Processor block is NOT currently declaring the SF Defect condition. This bit is set to "0" when the number of B2 byte errors (accumulated over a given interval of time) does not exceed the "SF Defect Declaration" threshold. 1 – Indicates that the Receive STS-3 TOH Processor block is currently declaring the SF Defect condition. This bit is set to "1" when the number of B2 byte errors (accumulated over a given interval of time) does exceed the "SF Defect Declaration" threshold.
3	SD Defect Declared	R/O	**SD (Signal Degrade) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-3 TOH Processor block is currently declaring the SD defect condition. The Receive STS-3 TOH Processor block will declare the SD defect condition anytime it has determined that the number of B2 byte errors (measured over a user-selected period of time) exceeds a certain "user-specified B2 Byte Error" threshold. 0 – Indicates that the Receive STS-3 TOH Processor block is NOT currently declaring the SD Defect condition. This bit is set to "0" when the number of B2 byte errors (accumulated over a given interval of time) does not exceed the "SD Defect Declaration" threshold. 1 – Indicates that the Receive STS-3 TOH Processor block is currently declaring the SD Defect condition. This bit is set to "1" when the number of B2 byte errors (accumulated over a given interval of time) does exceed the "SD Defect Declaration" threshold.
2	LOF Defect Declared	R/O	**LOF (Loss of Frame) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-3 TOH Processor block is currently declaring the LOF defect condition. The Receive STS-3 TOH Processor block will declare the LOF defect condition, if it has been declaring the SEF (Severely Errored Frame) defect condition for 3ms (or 24 SONET frame periods). 0 – Indicates that the Receive STS-3 TOH Processor block is NOT currently declaring the LOF defect condition. 1 – Indicates that the Receive STS-3 TOH Processor block is currently declaring the LOF defect condition.
1	SEF Defect Declared	R/O	**SEF (Severely Errored Frame) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-3 TOH Processor block is currently declaring the SEF defect condition. The Receive STS-3 TOH Processor block will declare the SEF defect condition if the "SEF Declaration Criteria"; per the settings of the FRPATOUT[1:0] bits, within the Receive STS-3 Transport – In-Sync Threshold Value Register (Address Location= 0x112B) are met. 0 – Indicates that the Receive STS-3 TOH Processor block is NOT currently declaring the SEF defect condition. 1 – Indicates that the Receive STS-3 TOH Processor block is currently declaring the SEF defect condition.
0	LOS Defect Declared	R/O	**LOS (Loss of Signal) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-3 TOH Processor block is currently declaring the LOS (Loss of Signal) defect condition. The Receive STS-3 TOH Processor block will declare the LOS defect condition if

			it detects "LOS_THRESHOLD[15:0]" consecutive "All Zero" bytes in the incoming STS-3 data stream. ***Note:*** *The user can set the "LOS_THRESHOLD[15:0]" value by writing the appropriate data into the "Receive STS-3 Transport – LOS Threshold Value" Register (Address Location= 0x112E and 0x112F).* 0 – Indicates that the Receive STS-3 TOH Processor block is NOT currently declaring the LOS defect condition. 1 – Indicates that the Receive STS-3 TOH Processor block is currently declaring the LOS defect condition.

Table 66: Receive STS-3 Transport Interrupt Status Register – Byte 2 (Address Location= 0x1109)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused						Change of AIS-L Defect Condition Interrupt Status	Change of RDI-L Defect Condition Interrupt Status
R/O	R/O	R/O	R/O	R/O	R/O	RUR	RUR
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 2	Unused	R/O	
1	Change of AIS-L Defect Condition Interrupt Status	RUR	**Change of AIS-L (Line AIS) Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change of AIS-L Defect Condition" interrupt has occurred since the last read of this register. The Receive STS-3 TOH Processor block will generate this interrupt in response to either of the following occurrences. • Whenever the Receive STS-3 TOH Processor block declares the AIS-L defect condition. • Whenever the Receive STS-3 TOH Processor block clears the AIS-L defect condition. 0 – Indicates that the "Change of AIS-L Defect Condition" interrupt has not occurred since the last read of this register. 1 – Indicates that the "Change of AIS-L Defect Condition" interrupt has occurred since the last read of this register. ***Note:*** *The user can determine if the Receive STS-3 TOH Processor block is currently declaring the AIS-L defect condition by reading the contents of Bit 0 (AIS-L Defect Declared) within the "Receive STS-3 Transport Status Register – Byte 1" (Address Location = 0x1106).*
0	Change of RDI-L Defect Condition Interrupt Status	RUR	**Change of RDI-L (Line - Remote Defect Indicator) Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change of RDI-L Defect Condition" interrupt has occurred since the last read of this register. The Receive STS-3 TOH Processor block will generate this interrupt in response to either of the following occurrences. • Whenever the Receive STS-3 TOH Processor block declares the RDI-L defect condition. • Whenever the Receive STS-3 TOH Processor block clears the RDI-L defect condition. 0 – Indicate that the "Change of RDI-L Defect Condition" interrupt has not occurred since the last read of this register. 1 – Indicates that the "Change of RDI-L Defect Condition" interrupt has occurred since the last read of this register. ***Note:*** *The user can determine if the Receive STS-3 TOH Processor block is currently declaring the RDI-L defect condition by reading out the state of Bit 7 (RDI-L Defect Declared) within the "Receive STS-3 Transport Status Register – Byte 0" (Address Location = 0x1107).*

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	New S1 Byte Value Interrupt Status	RUR	**New S1 Byte Value Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "New S1 Byte Value" Interrupt has occurred since the last read of this register. The Receive STS-3 TOH Processor block will generate the "New S1 Byte Value" Interrupt, anytime it has "accepted" a new S1 byte, from the incoming STS-3 data-stream. 0 – Indicates that the "New S1 Byte Value" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "New S1 Byte Value" interrupt has occurred since the last read of this register. ***Note:*** *The user can obtain the value for this most recently accepted value of the S1 byte by reading the "Receive STS-3 Transport S1 Byte Value" register (Address Location= 0x1127).*
6	Change in S1 Byte Unstable Defect Condition Interrupt Status	RUR	**Change in S1 Byte Unstable Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in S1 Byte Unstable Defect Condition" Interrupt has occurred since the last read of this register. The Receive STS-3 TOH Processor block will generate this interrupt in response to either of the following events. • Whenever the Receive STS-3 TOH Processor block declares the "S1 Byte Unstable" defect condition. • Whenever the Receive STS-3 TOH Processor block clears the "S1 Byte Unstable" defect condition. 0 – Indicates that the "Change in S1 Byte Unstable Defect Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change in S1 Byte Unstable Defect Condition" Interrupt has occurred since the last read of this register. ***Note:*** *The user can determine if the Receive STS-3 TOH Processor block is currently declaring the "S1 Byte Unstable" Defect condition by reading the contents of Bit 6 (S1 Byte Unstable Condition Defect Declared) within the "Receive STS-3 Transport Status Register – Byte 0" (Address Location = 0x1107).*
5	Change in Section Trace Message Unstable Defect Condition Interrupt Status	RUR	**Change in Section Trace Message Unstable Defect condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in Section Trace Message Unstable" defect condition interrupt has occurred since the last read of this register. The Receive STS-3 TOH Processor

	Interrupt Status		block will generate this interrupt in response to either of the following events. • Whenever the Receive STS-3 TOH Processor block declares the "Section Trace Message Unstable" defect condition. • Whenever the Receive STS-3 TOH Processsor block clears the "Section Trace Message Unstable" defect condition. 0 – Indicates that the "Change in Section Trace Message Unstable defect" condition interrupt has not occurred since the last read of this register. 1 – Indicates that the "Change in Section Trace Message Unstable defect" condition interrupt has occurred since the last read of this register.
4	New Section Trace Message Interrupt Status	RUR	**New Section Trace Message Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "New Section Trace Message" interrupt has occurred since the last read of this register. The Receive STS-3 TOH Processor block will generate this interrupt anytime it has accepted a new "Section Trace" Message within the incoming STS-3 data-stream. 0 – Indicates that the "New Section Trace Message Interrupt" has not occurred since the last read of this register. 1 – Indicates that the "New Section Trace Message Interrupt" has occurred since the last read of this register. ***Note:*** *The user can read out the contents of the "Receive Section Trace Message Buffer", which is located at Address location 0x1300 through 0x133F.*
3	Change in Section Trace Message Mismatch Defect Condition Interrupt Status	RUR	**Change in Section Trace Message Mismatch Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in Section Trace Message Mismatch Defect Condition" interrupt has occurred since the last read of this register. The Receive STS-3 TOH Processor block will generate this interrupt in response to either of the following events. • Whenever the Receive STS-3 TOH Processor block declares the "Section Trace Message Mismatch" defect condition. • Whenever the Receive STS-3 TOH Processor block clears the "Section Trace Message Mismatch" defect condition. 0 – Indicates that the "Change in Section Trace Message Mismatch Defect Condition" interrupt has not occurred since the last read of this register. 1 – Indicates that the "Change in Section Trace Message Mismatch Defect Condition" interrupt has occurred since the last read of this register. ***Note:*** *The user can determine whether the Receive STS-3 TOH Processor block is currently declaring the "Section Trace Message Mismatch" defect condition by reading the state of Bit 2 (Section Trace Message Mismatch Defect Declared) within the "Receive STS-3 Transport Status Register – Byte 1 (Address Location = 0x1106).*
2	Receive TOH CAP DONE Interrupt Status	RUR	**Receive TOH Capture DONE – Interrupt Status:** This RESET-upon-READ bit-field indicates whether the "Receive TOH Data Capture" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive STS-3 TOH Processor block will generate an interrupt anytime it has captured the last TOH byte into the Capture Buffer. ***Note:*** *Once the TOH (of a given STS-3 frame) has been captured and loaded into the "Receive TOH Capture" buffer, it will remain there*

			for one SONET frame period. 0 – Indicates that the "Receive TOH Data Capture" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Receive TOH Data Capture" Interrupt has occurred since the last read of this register.
1	Change in K1, K2 Byte Unstable Defect Condition Interrupt Status	RUR	**Change of K1, K2 Byte Unstable Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in K1, K2 Byte Unstable Defect Condition" interrupt has occurred since the last read of this register. The Receive STS-3 TOH Processor block will generate this interrupt in response to either of the following events. • Whenever the Receive STS-3 TOH Processor block declares the "K1, K2 Byte Unstable Defect" condition. • Whenever the Receive STS-3 TOH Processor block clears the "K1, K2 Byte Unstable Defect" condition. 0 – Indicates that the "Change of K1, K2 Byte Unstable Defect Condition" interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change of K1, K2 Byte Unstable Defect Condition" interrupt has occurred since the last read of this register. ***Note:*** *The user can determine if the Receive STS-3 TOH Processor block is currently declaring the "K1, K2 Byte Unstable Defect Condition" by reading out the contents of Bit 5 (K1, K2 Byte Unstable Defect Declared), within the "Receive STS-3 Transport Status Register – Byte 0" (Address Location = 0x1107).*
0	New K1, K2 Byte Value Interrupt Status	RUR	**New K1, K2 Byte Value Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "New K1, K2 Byte Value" Interrupt has occurred since the last read of this register. The Receive STS-3 TOH Processor block will generate this interrupt whenever it has "accepted" a new set of K1, K2 byte values from the incoming STS-3 data-stream. 0 – Indicates that the "New K1, K2 Byte Value" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "New K1, K2 Byte Value" Interrupt has occurred since the last read of this register. ***Note:*** *The user can obtain the contents of the new K1 byte by reading out the contents of the "Receive STS-3 Transport K1 Byte Value" Register (Address Location= 0x111F). Further, the user can also obtain the contents of the new K2 byte by reading out the contents of the "Receive STS-3 Transport K2 Byte Value" Register (Address Location= 0x1123).*

7	Change in SF Defect Condition Interrupt Status	RUR	**Change of Signal Failure (SF) Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change of SF Defect Condition Interrupt" has occurred since the last read of this register. The Receive STS-3 TOH Processor block will generate this interrupt in response to either of the following events. • Whenever the Receive STS-3 TOH Processor block declares the SF Defect Condition. • Whenever the Receive STS-3 TOH Processor block clears the SF Defect Condition. 0 – Indicates that the "Change of SF Defect Condition Interrupt" has NOT occurred since the last read of this register. 1 – Indicates that the "Change of SF Defect Condition Interrupt" has occurred since the last read of this register. ***Note:*** *The user can determine whether or not the Receive STS-3 TOH Processor block is currently declaring the "SF" defect condition by reading out the state of Bit 4 (SF Defect Declared) within the "Receive STS-3 Transport Status Register – Byte 0 (Address Location= 0x1107).*
6	Change of SD Defect Condition Interrupt Status	RUR	**Change of Signal Degrade (SD) Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change of SD Defect Condition Interrupt" has occurred since the last read of this register. The Receive STS-3 TOH Processor block will generate this interrupt in response to either of the following events. • Whenever the Receive STS-3 TOH Processor block declares the SD Defect Condition. • Whenever the Receive STS-3 TOH Processor block clears the SD Defect Condition. 0 - Indicates that the "Change of SD Defect Condition Interrupt" has NOT occurred since the last read of this register. 1 – Indicates that the "Change of SD Defect Condition Interrupt" has occurred since the last read of this register. ***Note:*** *The user can determine whether or not the Receive STS-3 TOH Processor block is declaring the "SD" defect condition by reading out the state of Bit 3 (SD Defect Declared) within the "Receive STS-3 Transport Status Register – Byte 0 (Address Location= 0x1107).*
5	Detection of REI-L Event Interrupt Status	RUR	**Detection of REI-L (Line – Remote Error Indicator) Event Interrupt Status:**

	Status		This RESET-upon-READ bit-field indicates whether or not the "Detection of REI-L Event" Interrupt has occurred since the last read of this register. The Receive STS-3 TOH Processor block will generate this interrupt anytime it detects an REI-L event within the incoming STS-3 data-stream. 0 – Indicates that the "Detection of REI-L Event" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of Line – REI-L Event" Interrupt has occurred since the last read of this register.
4	Detection of B2 Byte Error Interrupt Status	RUR	**Detection of B2 Byte Error Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of B2 Byte Error Interrupt" has occurred since the last read of this register. The Receive STS-3 TOH Processor block will generate this interrupt anytime it detects a B2 byte error within the incoming STS-3 data-stream. 0 – Indicates that the "Detection of B2 Byte Error Interrupt" has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of B2 Byte Error Interrupt" has occurred since the last read of this register.
3	Detection of B1 Byte Error Interrupt Status	RUR	**Detection of B1 Byte Error Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of B1 Byte Error Interrupt" has occurred since the last read of this register. The Receive STS-3 TOH Processor block will generate this interrupt anytime it detects a B1 byte error within the incoming STS-3 data-stream. 0 – Indicates that the "Detection of B1 Byte Error Interrupt" has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of B1 Byte Error Interrupt" has occurred since the last read of this register
2	Change of LOF Defect Condition Interrupt Status	RUR	**Change of Loss of Frame (LOF) Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change of LOF Defect Condition" interrupt has occurred since the last read of this register. The Receive STS-3 TOH Processor block will generate this interrupt in response to either of the following events. • Whenever the Receive STS-3 TOH Processor block declares the LOF defect condition. • Whenever the Receive STS-3 TOH Processor block clears the LOF defect condition. 0 – Indicates that the "Change of LOF Defect Condition" interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change of LOF Defect Condition" interrupt has occurred since the last read of this register. ***Note:*** *The user can determine whether or not the Receive STS-3 TOH Processor block is currently declaring the LOF defect condition by reading out the state of Bit 2 (LOF Defect Declared) within the "Receive STS-3 Transport Status Register – Byte 0 (Address Location= 0x1107).*
1	Change of SEF Defect Condition Interrupt Status	RUR	**Change of SEF Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change of SEF" Defect Condition Interrupt has occurred since the last read of this register. The Receive STS-3 TOH Processor block will generate this interrupt in response to either of the following events. • Whenever the Receive STS-3 TOH Processor block declares the SEF

			defect condition. • Whenever the Receive STS-3 TOH Processor block clears the SEF defect condition. 0 – Indicates that the "Change of SEF Defect Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change of SEF Defect Condition" Interrupt has occurred since the last read of this register. ***Note:*** *The user can determine whether or not the Receive STS-3 TOH Processor block is currently declaring the SEF defect condition by reading out the state of Bit 1 (SEF Defect Declared) within the "Receive STS-3 Transport Status Register – Byte 0 (Address Location= 0x1107).*
0	Change of LOS Defect Condition Interrupt Status	RUR	**Change of Loss of Signal (LOS) Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change of LOS Defect Condition" interrupt has occurred since the last read of this register. The Receive STS-3 TOH Processor block will generate this interrupt in response to either of the following events. • Whenever the Receive STS-3 TOH Processor block declares the LOS defect condition. • Whenever the Receive STS-3 TOH Processor block clears the LOS defect condition. 0 – Indicates that the "Change of LOS Defect Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change of LOS Defect Condition" Interrupt has occurred since the last read of this register. ***Note:*** *The user can determine whether or not the Receive STS-3 TOH Processor block is currently declaring the LOS defect condition by reading out the contents of Bit 0 (LOS Defect Declared) within the Receive STS-3 Transport Status Register – Byte 0 (Address Location= 0x1107).*

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	New S1 Byte Value Interrupt Enable	R/W	**New S1 Byte Value Interrupt Enable:** This READ/WRITE bit-field permits the user to enable or disable the "New S1 Byte Value" Interrupt. If the user enables this interrupt, then the Receive STS-3 TOH Processor block will generate this interrupt anytime it receives and accepts a new S1 byte value. The Receive STS-3 TOH Processor block will accept a new S1 byte after it has received it for 8 consecutive STS-3 frames. 0 – Disables the "New S1 Byte Value" Interrupt. 1 – Enables the "New S1 Byte Value" Interrupt.
6	Change in S1 Unstable Defect Condition Interrupt Enable	R/W	**Change in S1 Byte Unstable Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in S1 Byte Unstable Defect Condition" Interrupt. If the user enables this bit-field, then the Receive STS-3 TOH Processor block will generate an interrupt in response to either of the following conditions. • Whenever the Receive STS-3 TOH Processor block declares the "S1 Byte Unstable" defect condition. • Whenever the Receive STS-3 TOH Processor block clears the "S1 Byte Unstable" defect condition. 0 – Disables the "Change in S1 Byte Unstable Defect Condition" Interrupt. 1 – Enables the "Change in S1 Byte Unstable Defect Condition" Interrupt.
5	Change in Section Trace Message Unstable Defect Condition Interrupt Enable	R/W	**Change in Section Trace Message Unstable defect condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in Section Trace Message Unstable Defect Condition" Interrupt. If the user enables this interrupt, then the Receive STS-3 TOH Processor block will generate an interrupt in response to either of the following conditions. • Whenever the Receive STS-3 TOH Processor block declares the "Section Trace Message Unstable" defect condition. • Whenever the Receive STS-3 TOH Processor block clears the "Section Trace Message Unstable" defect condition. 0 – Disables the "Change in Section Trace Message Unstable Defect Condition" Interrupt. 1 – Enables the "Change in Section Trace Message Unstable Defect Condition" Interrupt.
4	New Section	R/W	**New Section Trace Message Interrupt Enable:**

	Trace Message Interrupt Enable		This READ/WRITE bit-field permits the user to enable or disable the "New Section Trace Message" interrupt. If the user enables this interrupt, then the Receive STS-3 TOH Processor block will generate this interrupt anytime it receives and accepts a new Section Trace Message. The Receive STS-3 TOH Processor block will accept a new Section Trace Message after it has received it 3 (or 5) consecutive times via the J0 byte within the incoming STS-3 data-stream. 0 – Disables the "New Section Trace Message" Interrupt. 1 – Enables the "New Section Trace Message" Interrupt.
3	Change in Section Trace Message Mismatch Defect Condition Interrupt Enable	R/W	**Change in "Section Trace Message Mismatch Defect Condition" interrupt enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in Section Trace Message Mismatch Defect condition" interrupt. If the user enables this interrupt, then the Receive STS-3 TOH Processor block will generate an interrupt in response to either of the following events. • Whenever the Receive STS-3 TOH Processor block declares the "Section Trace Message Mismatch" defect condition. • Whenever the Receive STS-3 TOH Processor block clears the "Section Trace Message Mismatch" defect condition. ***Note:*** *The user can determine whether or not the Receive STS-3 TOH Processor block is currently declaring the "Section Trace Message Mismatch" defect condition by reading the state of Bit 2 (Section Trace Message Mismatch Defect Declared) within the "Receive STS-3 Transport Status Register – Byte 1 (Address Location= 0x1106).*
2	Receive TOH CAP DONE Interrupt Enable	R/W	**Receive TOH Capture DONE – Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Receive TOH Data Capture" interrupt, within the Receive STS-3 TOH Processor Block. If this interrupt is enabled, then the Receive STS-3 TOH Processor block will generate an interrupt anytime it has captured the last TOH byte into the Capture Buffer. ***Note:*** *Once the TOH (of a given STS-3 frame) has been captured and loaded into the "Receive TOH Capture" buffer, it will remain there for one SONET frame period.* 0 – Disables the "Receive TOH Capture" Interrupt. 1 – Enables the "Receive TOH Capture" Interrupt.
1	Change in K1, K2 Byte Unstable Defect Condition Interrupt Enable	R/W	**Change of K1, K2 Byte Unstable Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change of K1, K2 Byte Unstable defect condition" interrupt. If the user enables this interrupt, then the Receive STS-3 TOH Processor block will generate an Interrupt in response to either of the following events. • Whenever the Receive STS-3 TOH Processor block declares the "K1, K2 Byte Unstable defect" condition. • Whenever the Receive STS-3 TOH Processor block clears the "K1, K2 Byte Unstable defect" condition. 0 – Disables the "Change in K1, K2 Byte Unstable Defect Condition" Interrupt 1 – Enables the "Change in K1, K2 Byte Unstable Defect Condition" Interrupt
0	New K1K2 Byte Interrupt Enable	R/W	**New K1, K2 Byte Value Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "New K1, K2 Byte Value" Interrupt. If the user enables this interrupt, then the Receive STS-3 TOH Processor block will generate this interrupt anytime it receives and accepts a new K1, K2 byte value. The Receive STS-3 TOH Processor block will accept a new

			K1, K2 byte value, after it has received it within 3 (or 5) consecutive STS-3 frames. 0 – Disables the “New K1, K2 Byte Value” Interrupt. 1 – Enables the “New K1, K2 Byte Value” Interrupt.

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Change of SF Defect Condition Interrupt Enable	R/W	**Change of Signal Failure (SF) Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change of Signal Failure (SF) Defect Condition" Interrupt. If the user enables this interrupt, then the XRT94L33 will generate an interrupt in response to any of the following events. • Whenever the Receive STS-3 TOH Processor block declares the SF defect condition. • Whenever the Receive STS-3 TOH Processor block clears the SF defect condition. 0 – Disables the "Change of SF Defect Condition Interrupt". 1 – Enables the "Change of SF Defect Condition Interrupt".
6	Change of SD Defect Condition Interrupt Enable	R/W	**Change of Signal Degrade (SD) Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change of Signal Degrade (SD) Defect Condition" Interrupt. If the user enables this interrupt, then the XRT94L33 will generate an interrupt in response to either of the following events. • Whenever the Receive STS-3 TOH Processor block declares the SD defect condition. • Whenever the Receive STS-3 TOH Processor block clears the SD defect condition. 0 – Disables the "Change of SD Defect Condition Interrupt". 1 – Enables the "Change of SD Defect Condition Interrupt".
5	Detection of REI-L Event Interrupt Enable	R/W	**Detection of REI-L (Line – Remote Error Indicator) Event Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of REI-L Event interrupt. If the user enables this interrupt, then the XRT94L33 will generate an interrupt anytime the Receive STS-3 TOH Processor block detects an "REI-L" event, within the incoming STS-3 data-stream. 0 – Disables the "Detection of REI-L Event" Interrupt. 1 – Enables the "Detection of REI-L Event" Interrupt.
4	Detection of B2 Byte Error Interrupt Enable	R/W	**Detection of B2 Byte Error Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of B2 Byte Error" Interrupt. If the user enables this interrupt, then the XRT94L33 will generate an interrupt anytime the Receive STS-3 TOH Processor block detects a B2 byte error within the incoming STS-3 data-

			stream. 0 – Disables the “Detection of B2 Byte Error Interrupt”. 1 – Enables the “Detection of B2 Byte Error Interrupt”.
3	Detection of B1 Byte Error Interrupt Enable	R/W	**Detection of B1 Byte Error Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the “Detection of B1 Byte Error” Interrupt. If the user enables this interrupt, then the XRT94L33 will generate an interrupt anytime the Receive STS-3 TOH Processor block detects a B1 byte error within the incoming STS-3 data-stream. 0 – Disables the “Detection of B1 Byte Error Interrupt”. 1 – Enables the “Detection of B1 Byte Error Interrupt”.
2	Change of LOF Defect Condition Interrupt Enable	R/W	**Change of Loss of Frame (LOF) Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the “Change of LOF Defect Condition” interrupt. If the user enables this interrupt, then the XRT94L33 will generate an interrupt in response to either of the following conditions. • Whenever the Receive STS-3 TOH Processor block declares the “LOF” defect condition. • Whenever the Receive STS-3 TOH Processor clears the “LOF” defect condition. 0 – Disables the “Change of LOF Defect Condition Interrupt. 1 – Enables the “Change of LOF Defect Condition” Interrupt.
1	Change of SEF Defect Condition Interrupt Enable	R/W	**Change of SEF Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the “Change of SEF Defect Condition” Interrupt. If the user enables this interrupt, then the XRT94L33 will generate an interrupt in response to either of the following conditions. • Whenever the Receive STS-3 TOH Processor block declares the “SEF” defect condition. • Whenever the Receive STS-3 TOH Processor block clears the ”SEF” defect condition. 0 – Disables the “Change of SEF Defect Condition Interrupt”. 1 – Enables the “Change of SEF Defect Condition Interrupt”.
0	Change of LOS Defect Condition Interrupt Enable	R/W	**Change of Loss of Signal (LOS) Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the “Change of LOF Defect Condition” interrupt. If the user enables this interrupt, then the XRT94L33 will generate an interrupt in response to either of the following conditions. • Whenever the Receive STS-3 TOH Processor block declares the “LOF” defect condition. • Whenever the Receive STS-3 TOH Processor block clears the “LOF” defect condition. 0 – Disables the “Change of LOF Defect Condition Interrupt. 1 – Enables the “Change of LOF Defect Condition” Interrupt.

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 0	SF_SET_THRESHOLD[15:8]	R/W	**SF_SET_THRESHOLD – MSB:** These READ/WRITE bits, along the contents of the "Receive STS-3 Transport – SF SET Threshold – Byte 0" registers permit the user to specify the number of B2 byte errors that will cause the Receive STS-3 TOH Processor block to declare the SF (Signal Failure) Defect condition. When the Receive STS-3 TOH Processor block is checking the incoming STS-3 signal in order to determine if it should declare the SF defect condition, it will accumulate B2 byte errors throughout the "SF Defect Declaration Monitoring Period". If the number of accumulated B2 byte errors exceeds that value, which is programmed into this and the "Receive STS-3 Transport SF SET Threshold – Byte 0" register, then the Receive STS-3 TOH Processor block will declare the SF defect condition. **NOTE:** This particular register functions as the MSB (Most Signficant byte) of the "16-bit" expression for the "SF Defect Declaration B2 Byte Error" Threshold.

R/O	R/O	R/O	R/W	R/W	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 5	Unused	R/O	
4	Receive Section Trace Message Buffer Read Select	R/W	**Receive Section Trace Message Buffer Read Selection:** This READ/WRITE bit-field permits the user to specify which of the following Receive Section Trace Message buffer segments that the Microprocessor will read out, whenever it reads out the contents of the Receive Section Trace Message Buffer address space. a. The "Actual" Receive Section Trace Message Buffer. The "Actual" Receive Section Trace Message Buffer contains the contents of the most recently received (and accepted) Section Trace Message via the incoming STS-3 data-stream. b. The "Expected" Receive Section Trace Message Buffer. The "Expected" Receive Section Trace Message Buffer contains the contents of the Section Trace Message that the user "expects" to receive. The contents of this particular buffer is usually specified by the user. 0 – Executing a READ operation to the Receive Section Trace Message Buffer address space will return contents within the "Actual" Receive Section Trace Message" buffer. 1 – Executing a READ operation to the Receive Section Trace Message Buffer address space will return contents within the "Expected" Receive Section Trace Message Buffer". ***Note:*** *In the case of the Receive STS-3 TOH Processor block, the "Receive Section Trace Message Buffer" is located at Address location 0x1300 through 0x133F.*
3	Receive Section Trace Message Accept Threshold	R/W	**Receive Section Trace Message Accept Threshold:** This READ/WRITE bit-field permits a user to select the number of consecutive times that the Receive STS-3 TOH Processor block must receive a given Section Trace Message, before it is accepted, as described below. Once a given "Section Trace Message" has been accepted then it can be read out of the "Actual Receive Section Trace Message" Buffer. 0 – Configures the Receive STS-3 TOH Processor block to accept the incoming Section Trace Message after it has received it the third time in succession. 1 – Configures the Receive STS-3 TOH Processor block to accept the incoming Section Trace Message after it has received it the fifth time in succession.

<table>
<tr><td>2</td><td>Section Trace Message Alignment Type</td><td>R/W</td><td>Section Trace Message Alignment Type:

This READ/WRITE bit-field permits a user to specify how the Receive STS-3 TOH Processor block will locate the boundary of the incoming Section Trace Message within the incoming STS-3 data-stream, as indicated below.

0 – Configures the Receive STS-3 TOH Processor block to expect the Section Trace Message boundary to be denoted by a “Line Feed” character.

1 – Configures the Receive STS-3 TOH Processor block to expect the Section Trace Message boundary to be denoted by the presence of a “1” in the MSB (most significant bit) of the very first byte (within the incoming Section Trace Message). In this case, all of the remaining bytes (within the incoming Section Trace Message) will each have a “0” within their MSBs.</td></tr>
<tr><td>1 - 0</td><td>Receive Section Trace Message Length[1:0]</td><td>R/W</td><td>Receive Section Trace Message Length[1:0]:

These READ/WRITE bit-fields permit the user to specify the length of the Section Trace Message that the Receive STS-3 TOH Processor block will accept and load into the “Actual” Receive Section Trace Message Buffer. The relationship between the content of these bit-fields and the corresponding Receive Section Trace Message Length is presented below.
<table>
<tr><th>Receive Section Trace Message Length[1:0]</th><th>Resulting Section Trace Message Length (in terms of bytes)</th></tr>
<tr><td>00</td><td>1 Byte</td></tr>
<tr><td>01</td><td>16 Bytes</td></tr>

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 0	SF_CLEAR_MONITOR_WINDOW [23:16]	R/W	**SF_CLEAR_MONITOR_INTERVAL – MSB:** These READ/WRITE bits, along with the contents of the "Receive STS-3 Transport – SF Clear Monitor Interval – Byte 1 and Byte 0" registers permit the user to specify the length of the "monitoring period" (in terms of ms) for SF (Signal Failure) defect clearance. When the Receive STS-3 TOH Processor block is checking the incoming STS-3 signal in order to determine if it should clear the SF defect condition, it will accumulate B2 byte errors throughout the user-specified "SF Defect Clearance" Monitoring period. If, during this "SF Defect Clearance" Monitoring period, the Receive STS-3 TOH Processor block accumulates less B2 byte errors than that programmed into the "Receive STS-3 Transport SF Clear Threshold" register, then the Receive STS-3 TOH Processor block will clear the SF defect condition. **NOTES:** 1. The value that the user writes into these three (3) "SF Clear Monitor Window Registers", specifies the duration of the "SF Defect Clearance Monitoring Period", in terms of ms. 2. This particular register byte contains the "MSB" (most significant byte) value fo the three registers that specify the "SF Defect Clearance Monitoring" period.

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Transmit AIS-P (Down-stream) upon Section Trace Message Unstable	R/W	**Transmit Path AIS upon Declaration of the Section Trace Message Unstable Defect Condition:** This READ/WRITE bit-field permits the user to configure the Receive STS-3 TOH Processor block to automatically transmit the Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards each of the three Receive SONET POH Processor blocks), anytime (and for the duration that) it declares the Section Trace Message Unstable defect condition within the "incoming" STS-3 data-stream. 0 – Does not configure the Receive STS-3 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic) whenever (and for the duration that) it declares the "Section Trace Message Unstable" defect condition. 1 – Configures the Receive STS-3 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic towards each of the three Receive SONET POH Processor blocks) whenever (and for the duration that) it declares the "Section Trace Message Unstable" defect condition. ***Note:*** *The user must also set Bit 0 (Transmit AIS-P Enable) to "1" to configure the Receive STS-3 TOH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.*
6	Transmit AIS-P (Down-stream) Upon Section Trace Message Mismatch	R/W	**Transmit Path AIS (AIS-P) upon Declaration of the Section Trace Message Mismatch Defect Condition:** This READ/WRITE bit-field permits the user to configure the Receive STS-3 TOH Processor block to automatically transmit the Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards each of the three Receive SONET POH Processor blocks), anytime it declares the Section Trace Message Mismatch defect condition within the "incoming" STS-3 data stream. 0 – Does not configure the Receive STS-3 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic) whenever (and for the duration that) it declares the "Section Trace Message Mismatch" defect condition. 1 – Configures the Receive STS-3 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic towards each of the three Receive SONET POH Processor blocks) whenever (and for the duration that) it declares the "Section Trace Message Mismatch" defect condition.

			Note: *The user must also set Bit 0 (Transmit AIS-P Enable) to "1" to configure the Receive STS-3 TOH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.*
5	Transmit AIS-P (Down-stream) upon SF	R/W	**Transmit Path AIS upon declaration of the Signal Failure (SF) defect condition:** This READ/WRITE bit-field permits the user to configure the Receive STS-3 TOH Processor block to automatically transmit the Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards each of the three Receive SONET POH Processor blocks), anytime it declares the SF defect condition. 0 – Does not configure the Receive STS-3 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic) whenever (and for the duration that) it declares the SF defect condition. 1 – Configures the Receive STS-3 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic towards each of the three Receive SONET POH Processor blocks) whenever (and for the duration that) it declares the SF defect condition. ***Note:*** *The user must also set Bit 0 (Transmit AIS-P Enable) to "1" to configure the Receive STS-3 TOH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.*
4	Transmit AIS-P (Down-stream) upon SD	R/W	**Transmit Path AIS upon declaration of the Signal Degrade (SD) defect condition:** This READ/WRITE bit-field permits the user to configure the Receive STS-3 TOH Processor block to automatically transmit the Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards each of the three Receive SONET POH Processor blocks), anytime it declares the SD defect condition. 0 – Does not configure the Receive STS-3 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic) whenever (and for the duration that) it declares the SD defect condition. 1 – Configures the Receive STS-3 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic towards each of the three Receive SONET POH Processor blocks) whenever (and for the duration that) it declares the SD defect condition. ***Note:*** *The user must also set Bit 0 (Transmit AIS-P Enable) to "1" to configure the Receive STS-3 TOH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.*
3	Transmit AIS-P (Down-stream) upon Loss of Optical Carrier	R/W	**Transmit Path AIS upon Loss of Optical Carrier condition:** This READ/WRITE bit-field permits the user to configure the Receive STS-3 TOH Processor block to automatically transmit the Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards each of the three Receive SONET POH Processor blocks), anytime it detects the "Loss of Optical Carrier" defect condition. 0 – Does not configure the Receive STS-3 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic) whenever (and for the duration that) it declares the "Loss of Optical Carrier" defect condition. 1 – Configures the Receive STS-3 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic towards each of the three Receive SONET POH Processor blocks) whenever (and for the duration that) it declares the "Loss of Optical

			Carrier" defect condition. ***Note:*** *The user must also set Bit 0 (Transmit AIS-P Enable) to "1" to configure the Receive STS-3 TOH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.*
2	Transmit AIS-P (Down-stream) upon LOF	R/W	**Transmit Path AIS upon declaration of the Loss of Frame (LOF) defect condition:** This READ/WRITE bit-field permits the user to configure the Receive STS-3 TOH Processor block to automatically transmit the Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards each of the three Receive SONET POH Processor block), anytime it declares the LOF defect condition. 0 – Does not configure the Receive STS-3 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic) whenever (and for the duration that) it declares the LOF defect condition. 1 – Configures the Receive STS-3 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic towards each of the three Receive SONET POH Processor blocks) whenever (and for the duration that) it declares the LOF defect condition. ***Note:*** *The user must also set Bit 0 (Transmit AIS-P Enable) to "1" to configure the Receive STS-3 TOH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.*
1	Transmit AIS-P (Down-stream) upon LOS	R/W	**Transmit Path AIS upon Loss of Signal (LOS):** This READ/WRITE bit-field permits the user to configure the Receive STS-3 TOH Processor block to automatically transmit the Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards each of the three Receive SONET POH Processor block), anytime it declares the LOS defect condition. 0 – Does not configure the Receive STS-3 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic) whenever (and for the duration that) it declares the LOS defect condition. 1 – Configures the Receive STS-3 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic towards each of the three Receive SONET POH Processor blocks) whenever (and for the duration that) it declares the LOS defect condition. ***Note:*** *The user must also set Bit 0 (Transmit AIS-P Enable) to "1" to configure the Receive STS-3 TOH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.*
0	Transmit AIS-P (Down-stream) Enable	R/W	**Automatic Transmission of AIS-P Enable:** This READ/WRITE bit-field serves two purposes. It permits the user to configure the Receive STS-3 TOH Processor block to automatically transmit the Path AIS (AIS-P) indicator, via the down-stream traffic (e.g., towards each of the three Receive SONET POH Processor blocks), upon declaration of either the SF, SD, Section Trace Message Mismatch, Section Trace Message Unstable, LOF, LOS or Loss of Optical Carrier defect conditions. It also permits the user to configure the Receive STS-3 TOH Processor block to automatically transmit a Path AIS (AIS-P) Indicator via the

			"downstream" traffic (e.g., towards each of the three Receive SONET POH Processor blocks) anytime (and for the duration that) it declares the AIS-L defect condition within the "incoming " STS-3 data-stream. 0 – Configures the Receive STS-3 TOH Processor block to NOT automatically transmit the AIS-P indicator (via the "downstream" traffic) whenever the Receive STS-3 TOH Processor block declares the AIS-L or any other of the "above-mentioned" defect conditions. 1 – Configures the Receive STS-3 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic towards each of the three Receive SONET POH Processor blocks) whenever (and for the duration that) the Receive STS-3 TOH Processor block declares the AIS-L, SD, SF, LOF, LOS, Section Trace Message Mismatch, Section Trace Message Unstable or Loss of Optical Carrier defect condition). ***Note:*** *The user must also set the corresponding bit-fields (within this register) to "1" in order to configure the Receive STS-3 TOH Processor block to automatically transmit the AIS-P indicator upon detection of a given alarm/defect condition.*

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 6	Unused	R/O	
5	Transmit AIS-P/AIS (via Downstream STS-1s/DS3s) upon LOS	R/W	**Transmit AIS-P (via Downstream STS-1s) upon declaration of the LOS (Loss of Signal) defect condition/Transmit DS3 AIS (via Downstream DS3s) upon declaration of the LOS Defect condition:** The exact function of this bit-field depends upon whether the XRT94L33 device has been configured to handle STS-1 or DS3 signals, on the "low-speed" side of the chip, as described below. **For those channels that are configured to operate in the STS-1 Mode:** This READ/WRITE bit-field permits the user to configure all of the active Transmit STS-1 POH Processor blocks (within the XRT94L33 device) to automatically transmit the AIS-P (Path AIS) Indicator via the "downstream" STS-1 signals, anytime (and for the duration that) the Receive STS-3 TOH Processor block declares the LOS defect condition. 0 – Does not configure all "activated" Transmit STS-1 POH Processor blocks to automatically transmit the AIS-P Indicator via the "downstream" STS-1 signals, anytime the Receive STS-3 TOH Processor block declares the LOS defect condition. 1 – Configures all "activated" Transmit STS-1POH Processor blocks to automatically transmit the AIS-P Indicator via the "downstream" STS-1 signals, anytime (and for the duration that) the Receive STS-3 TOH Processor block declares the LOS defect condition. ***Note:*** *1. In the "long-run" the function of this bit-field is exactly the same as that of Bit 1 (Transmit AIS-P Down-stream – Upon LOS), within the Receive STS-3 Transport – Auto AIS Control Register (Address Location= 0x1163). The only difference is that this register bit will cause each of the "downstream" Transmit STS-1 POH Processor blocks to IMMEDIATELY begin to transmit the AIS-P condition whenever the Receive STS-3 TOH Processor block declares the LOS defect. This will permit the user to easily comply with the Telcordia GR-253-CORE requirements of an NE transmitting the AIS-P indicator downstream within 125us of the NE declaring the LOS defect.* *2. In the case of Bit 1 (Transmit AIS-P Downstream – Upon LOS), several SONET frame periods are required (after the Receive STS-3*

			TOH Processor block has declared the LOS defect), before the Transmit STS-1 POH Processor blocks will begin the process of transmitting the AIS-P indicators. *3. In addition to setting this bit-field to "1", the user must also set Bit 0 (Transmit AIS-P via Downstream STS-1s Enable) within this register, in order enable this feature.* **For those channels that are configured to operate in the DS3 Mode:** This READ/WRITE bit-field permits the user to configure all of the active DS3/E3 Framer blocks (within the XRT94L33 device) to automatically transmit the DS3 AIS indicator via their "downstream" (or Egress Direction) DS3 signals, anytime (and for the duration that) the Receive STS-3 TOH Processor block declares the LOS defect condition. 0 – Does not configure all "active" DS3/E3 Framer blocks to automatically transmit the DS3 AIS indicator via their "downstream" DS3 signals, anytime the Receive STS-3 TOH Processor block declares the LOS defect condition. 1 – Configures all "active" DS3/E3 Framer blocks to automatically transmit the DS3 AIS Indicator via their "downstream" DS3 signals, anytime (and for the duration that) the Receive STS-3 TOH Processor block declares the LOS defect condition. **NOTE:** In addition to setting this bit-field to "1", the user must also set Bit 0 (Transmit AIS-P/AIS via Downstream STS-1s/DS3s Enable) within this register, in order to enable this feature.
4	Transmit AIS-P/AIS (via Downstream STS-1s/DS3s) upon LOF	R/W	**Transmit AIS-P (via Downstream STS-1s) upon declaration of the LOF (Loss of Frame) defect condition/Transmit DS3 AIS (via Downstream DS3s) upon declaration of the LOF defect condition:** The exact function of this bit-field depends upon whether the XRT94L33 device has been configured to handle STS-1 or DS3 signals, on the "low-speed" side of the chip, as described below. **For those channels that are configured to operate in the STS-1 Mode:** This READ/WRITE bit-field permits the user to configure all of the active Transmit STS-1 POH Processor blocks (within the XRT94L33 device) to automatically transmit the AIS-P (Path AIS) Indicator via the "downstream" STS-1 signals, anytime (and for the duration that) the Receive STS-3 TOH Processor block declares the LOF defect condition. 0 – Does not configures all "activated" Transmit STS-1 POH Processor blocks to automatically transmit the AIS-P Indicator via the "downstream" STS-1 signals, anytime the Receive STS-3 TOH Processor block declares the LOF defect condition. 1 – Configures all "activated" Transmit STS-1POH Processor blocks to automatically transmit the AIS-P Indicator via the "downstream" STS-1 signals, anytime (and for the duration that) the Receive STS-3 TOH Processor block declares the LOF defect condition. ***Note:*** *1. In the "long-run" the function of this bit-field is exactly the same as that of Bit 2 (Transmit AIS-P Down-stream – Upon LOF), within the Receive STS-3 Transport – Auto AIS Control Register (Address Location= 0x1163). The only difference is that this register bit will cause each of the "downstream" Transmit STS-1 POH Processor blocks to IMMEDIATELY begin to transmit the AIS-P condition whenever the Receive STS-3 TOH Processor block declares the LOF defect. This will permit the user to easily comply with the Telcordia GR-253-CORE requirements of an NE transmitting the AIS-P indicator downstream*

			within 125us of the NE declaring the LOF defect. *2. In the case of Bit 2 (Transmit AIS-P Downstream – Upon LOF), several SONET frame periods are required (after the Receive STS-3 TOH Processor block has declared the LOS defect), before the Transmit STS-1 POH Processor blocks will begin the process of transmitting the AIS-P indicators.* *3. In addition to setting this bit-field to "1", the user must also set Bit 0 (Transmit AIS-P via Downstream STS-1s Enable) within this register, in order enable this feature.* **For those channels that are configured to operate in the DS3 Mode:** This READ/WRITE bit-field permits the user to configure all of the active DS3/E3 Framer blocks (within the XRT94L33 device) to automatically transmit the DS3 AIS indicator via the "downstream" (or Egress Direction) DS3 signals, anytime (and for the duration that) the Receive STS-3 TOH Processor block declares the LOF defect condition. 0 – Does not configure all "active" DS3/E3 Framer blocks to automatically transmit the DS3 AIS indicator via the "downstream" DS3 signals, anytime the Receive STS-3 TOH Processor block declares the LOF defect condition. 1 – Configures all "active" DS3/E3 Framer blocks to automatically transmit the DS3 AIS Indicator via the "downstream" DS3 signals, anytime (and for the duration that) the Receive STS-3 TOH Processor block declares the LOF defect condition. **NOTE:** In addition to setting this bit-field to "1", the user must also set Bit 0 (Transmit AIS-P/AIS via Downstream STS-1s/DS3s Enable) within this register, in order to enable this feature.
3	Transmit AIS-P/AIS (via Downstream STS-1s/DS3s) upon SD	R/W	**Transmit AIS-P (via Downstream STS-1s) upon declaration of the SD (Signal Degrade) defect condition/Transmit DS3 AIS (via Downstream DS3s) upon declaration of the SD defect condition:** The exact function of this bit-field depends upon whether the XRT94L33 device has been configured to handle STS-1 or DS3 signals, on the "low-speed" side of the chip, as described below. **For those channels that are configured to operate in the STS-1 Modes:** This READ/WRITE bit-field permits the user to configure all of the active Transmit STS-1 POH Processor blocks (within the XRT94L33 device) to automatically transmit the AIS-P (Path AIS) Indicator via the "downstream" STS-1 signals, anytime (and for the duration that) the Receive STS-3 TOH Processor block declares the SD defect condition. 0 – Does not configures all "activated" Transmit STS-1 POH Processor blocks to automatically transmit the AIS-P Indicator via the "downstream" STS-1 signals, anytime the Receive STS-3 TOH Processor block declares the SD defect condition. 1 – Configures all "activated" Transmit STS-1POH Processor blocks to automatically transmit the AIS-P Indicator via the "downstream" STS-1 signals, anytime (and for the duration that) the Receive STS-3 TOH Processor block declares the SD defect condition. ***Note:*** *1. In the "long-run" the function of this bit-field is exactly the same as that of Bit 4 (Transmit AIS-P Down-stream – Upon SD), within the Receive STS-3 Transport – Auto AIS Control Register (Address Location= 0x1163). The only difference is that this register bit will cause each of the "downstream" Transmit STS-1 POH Processor blocks to*

			IMMEDIATELY begin to transmit the AIS-P condition whenever the Receive STS-3 TOH Processor block declares the SD defect. This will permit the user to easily comply with the Telcordia GR-253-CORE requirements of an NE transmitting the AIS-P indicator downstream within 125us of the NE declaring the LOS defect. *2. In the case of Bit 1 (Transmit AIS-P Downstream – Upon LOF), several SONET frame periods are required (after the Receive STS-3 TOH Processor block has declared the SD defect), before the Transmit STS-1 POH Processor blocks will begin the process of transmitting the AIS-P indicators.* *3. In addition to setting this bit-field to "1", the user must also set Bit 0 (Transmit AIS-P via Downstream STS-1s Enable) within this register, in order enable this feature.* **For those channels that are configured to operate in the DS3 Mode:** This READ/WRITE bit-field permits the user to configure all of the active DS3/E3 Framer blocks (within the XRT94L33 device) to automatically transmit the DS3 AIS indicator via the "downstream" (or Egress Direction) DS3 signals, anytime (and for the duration that) the Receive STS-3 TOH Processor block declares the SD defect condition. 0 – Does not configure all "active" DS3/E3 Framer block s to automatically transmit the DS3 AIS indicator via the "downstream" DS3 signals, anytime the Receive STS-3 TOH Processor block declares the SD defect condition. 1 – Configures all "active" DS3/E3 Framer blocks to automatically transmit the DS3 AIS Indicator via the "downstream" DS3 signals, anytime (and for the duration that) the Receive STS-3 TOH Processor block declares the SD defect condition. **NOTE:** In addition to setting this bit-field to "1" the user must also set Bit 0 (Transmit AIS-P/AIS via Downstream STS-1s/DS3s Enable) within this register, in order to enable this feature.
2	Transmit AIS-P/AIS (via Downstream STS-1s/DS3s) upon SF	R/W	**Transmit AIS-P (via Downstream STS-1s) upon declaration of the Signal Failure (SF) defect condition/Transmit DS3 AIS (via Downstream DS3s) upon declaration of the SF defect condition:** The exact function of this bit-field depends upon whether the XRT94L33 device has been configured to handle STS-1 or DS3 signals, on the "low-speed" side of the chip, as described below. **For those channels that are configured to operate in the STS-1 Mode:** This READ/WRITE bit-field permits the user to configure all of the active Transmit STS-1 POH Processor blocks (within the XRT94L33 device) to automatically transmit the AIS-P (Path AIS) Indicator via the "downstream" STS-1 signals, anytime (and for the duration that) the Receive STS-3 TOH Processor block declares the SF defect condition. 0 – Does not configures all "activated" Transmit STS-1 POH Processor blocks to automatically transmit the AIS-P Indicator via the "downstream" STS-1 signals, anytime the Receive STS-3 TOH Processor block declares the SF defect condition. 1 – Configures all "activated" Transmit STS-1POH Processor blocks to automatically transmit the AIS-P Indicator via the "downstream" STS-1 signals, anytime (and for the duration that) the Receive STS-3 TOH Processor block declares the SF defect condition. **NOTES:** *1. In the "long-run" the function of this bit-field is exactly the same as that*

			of Bit 5 (Transmit AIS-P Down-stream – Upon SF), within the Receive STS-3 Transport – Auto AIS Control Register (Address Location= 0x1163). The only difference is that this register bit will cause each of the "downstream" Transmit STS-1 POH Processor blocks to IMMEDIATELY begin transmit the AIS-P condition whenever the Receive STS-3 TOH Processor block declares the SF defect. This will permit the user to easily comply with the Telcordia GR-253-CORE requirements of an NE transmitting the AIS-P indicator downstream within 125us of the NE declaring the SF defect. *2. In the case of Bit 5 (Transmit AIS-P Downstream – Upon SF), several SONET frame periods are required (after the Receive STS-3 TOH Processor block has declared the SF defect), before the Transmit STS-1 POH Processor blocks will begin the process of transmitting the AIS-P indicators.* *3. In addition to setting this bit-field to "1", the user must also set Bit 0 (Transmit AIS-P via Downstream STS-1s Enable) within this register, in order enable this feature.* **For those channels that are configured to operate in the DS3 Mode:** This READ/WRITE bit-field permits the user to configure all of the active DS3/E3 Framer blocks (within the XRT94L33 device) to automatically transmit the DS3 AIS indicator via the "downstream" (or Egress Direction) DS3 signals, anytime (and for the duration that) the Receive STS-3 TOH Processor block declares the SF defect condition. 0 – Does not configure all "active" DS3/E3 Framer blocks to automatically transmit the DS3 AIS indicator via the "downstream" DS3 signals, anytime the Receive STS-3 TOH Processor block declares the SF defect condition. 1 – Configures all "active" DS3/E3 Framer blocks to automatically transmit the DS3 AIS indicator via the "downstream" DS3 signals, anytime (and for the duration that) the Receive STS-3 TOH Processor block declares the SF defect condition. **NOTE:** In addition to setting this bit-field to "1", the user must also set Bit 0 (Transmit AIS-P/AIS via Downstream STS-1s/DS3s Enable) within this register, in order to enable this feature.
1	AIS-L Output Enable	R/W	**AIS-L Output Enable:** This READ/WRITE bit-field, along with Bits 7 (8kHz or STUFF Out Enable) within the "Operation Output Control Register – Byte 1" (Address Location= 0x0150) permit the user to configure the "AIS-L" indicator to be output via the "LOF" output pin (pin AD11). If Bit 7 (within the "Operation Output Control Register – Byte 1") is set to "0", then setting this bit-field to "1" configures pin AD11 to function as the AIS-L output indicator. If Bit 7 (within the "Operation Output Control Register – Byte 1") is set to "0", then setting this bit-field to "0" configures pin AD11 to function as the LOF output indicator. If Bit 7 (within the "Operation Output Control Register – Byte 1) is set to "1", then this register bit is ignored.
0	Transmit AIS-P/AIS (via Downstream STS-1s/ DS3s) Enable	R/W	**Automatic Transmission of AIS-P/AIS (via the downstream STS-1s or DS3s) Enable:** The exact function of this bit-field depends upon whether the XRT94L33 device has been configured to handle STS-1 or DS3 signals, on the "low-speed" side of the chip, as described below. **For those channels that are configured to operate in the STS-1**

			Mode: This READ/WRITE bit-field permits the user to configure all "activated" Transmit STS-1 POH Processor blocks to automatically transmit the AIS-P indicator, via its "outbound" STS-1 signals, upon detection of an SF, SD, LOS, LOF and AIS-L defect conditions. 0 – Does not configure the "activated" Transmit STS-1 POH Processor blocks to automatically transmit the AIS-P indicator, whenever (and for the duration that) the Receive STS-3 TOH Processor block declares either the LOS, LOF, SD, SF or AIS defect condition. 1 – Configures the "activated" Transmit STS-1 POH Processor blocks to automatically transmit the AIS-P indicator (via their downstream signal paths), whenever (and for the duration that) the Receive STS-3 TOH Processor block declares either the LOS, LOF, SD, SF or AIS-L defect conditions. **NOTES:** 1. The user must also set the corresponding bit-fields (within this register) to "1" in order to configure all "active" Transmit STS-1 TOH Processor blocks to automatically transmit the AIS-P indicator (downstream) whenever (and for the duration that) the Receive STS-3 TOH Processor block declares the LOS, LOF, SD or SF defect conditions. 2. Setting this particular bit-field to "1" will also configure all "active" Transmit STS-1 TOH Processor blocks to automatically transmit the AIS-P indicator (downstream) whenever (and for the duration that) the Receive STS-3 TOH Processor block declares the AIS-L defect condition. **For those channels that are configured to operate in the DS3 Mode:** This READ/WRITE bit-field permits the user to configure all of the active DS3/E3 Framer blocks (within the XRT94L33 device) to automatically transmit the DS3 AIS indicator via the "downstream" (or Egress Direction) DS3 signals, anytime (and for the duration that) the Receive STS-3 TOH Processor block declares the LOS, LOF, SD, SF or AIS-L defect conditions. 0 – Does not configure all "active" DS3/E3 Framer blocks to automatically transmit the DS3 AIS indicator via their "downstream" DS3 signals, anytime the Receive STS-3 TOH Processor block declares either the LOS, LOF, SD, SF or AIS-L defect conditions. 1 – Configures all "active" DS3/E3 Framer blocks to automatically transmit the DS3 AIS indicator via their "downstream" DS3 signals, anytime (and for the duration that) the Receive STS-3 TOH Processor block declares either the LOS, LOF, SD, SF or AIS-L defect conditions. **NOTES:** 1. The user must also set the corresponding bit-fields (within this register) to "1" in order to configure all "active" DS3/E3 Framer blocks to automatically transmit the DS3 AIS indicator (downstream) whenever (and for the duration that) the Receive STS-3 TOH Processor block declares the LOS, LOF, SD or SF defect conditions. 2. Setting this particular bit-field to "1" will also configure all "active" DS3/E3 Framer blocks to automatically transmit the DS3 AIS indicator (downstream) whenever (and for the duration that) the Receive STS-3 TOH Processor block declares the AIS-L defect condition.

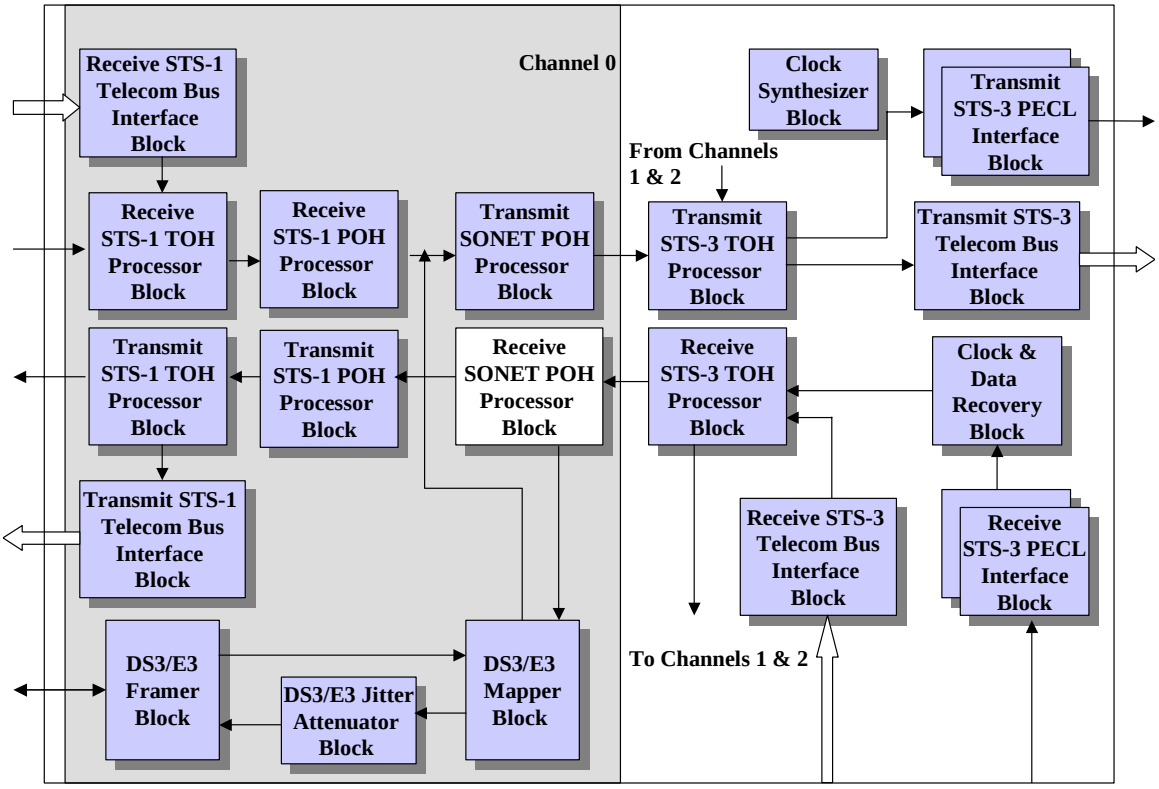
1.5 RECEIVE STS-3C POH PROCESSOR BLOCK

The register map for the Receive STS-3c POH Processor Block is presented in the Table below. Additionally, a detailed description of each of the "Receive STS-3c POH Processor" block registers is presented below.

In order to provide some orientation for the reader, an illustration of the Functional Block Diagram for the XRT94L33, with the "Receive STS-3c POH Processor Block "highlighted" is presented below in Figure 2.

It should be noted that for Mapper Aggregation Applications, the Receive STS-3c POH Processor block is only active if the user has configured the XRT94L33 device to handle STS-3c data via STS-1 Telecom Bus Interface # 1. The Receive STS-3c POH Processor block is also active if the user configures the XRT94L33 device to operate in the "ATM UNI" or "PPP Packet over STS-3c" Mode. For details on XRT94L33 device operate in the ATM or PPP Mode, the user should consult the "XRT94L33 Register Map/Description for ATM/PPP Applications" document.

Figure 2: Illustration of the Functional Block Diagram of the XRT94L33, with the Receive STS-3c POH Processor Block "High-lighted".



1.5.1 RECEIVE STS-3c POH PROCESSOR BLOCK REGISTER

Table 119: Receive STS-3c POH Processor Block Register - Address Map

ADDRESS LOCATION	REGISTER NAME	DEFAULT VALUES

1.5.2 RECEIVE STS-3c POH PROCESSOR BLOCK REGISTER DESCRIPTION

Table 120: Receive STS-3c Path – Control Register – Byte 0 (Address Location= 0x1183)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused				Check Stuff	RDI-P Type	REI-P Error Type	B3 Error Type
R/O	R/O	R/O	R/O	R/W	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 4	Unused	R/O	
3	Check Stuff	R/W	**Check (Pointer Adjustment) Stuff Select:** This READ/WRITE bit-field permits the user to enable/disable the SONET standard recommendation that a pointer increment or decrement operation, detected within 3 SONET frames of a previous pointer adjustment operation (e.g., negative stuff, positive stuff) is ignored. 0 – Disables this SONET standard implementation. In this mode, all pointer-adjustment operations that are detected will be accepted. 1 – Enables this "SONET standard" implementation. In this mode, all pointer-adjustment operations that are detected within 3 SONET frame periods of a previous pointer-adjustment operation will be ignored.
2	RDI-P Type	R/W	**Path – Remote Defect Indicator Type Select:** This READ/WRITE bit-field permits the user to configure the Receive STS-3c POH Processor block to support either the "Single-Bit" or the "Enhanced" RDI-P form of signaling, as described below. 0 – Configures the Receive STS-3c POH Processor block to support the Single-Bit RDI-P. In this mode, the Receive STS-3c POH Processor block will only monitor Bit 5, within the G1 byte (of incoming SPE data), in order to declare and clear the RDI-P defect condition. 1 – Configures the Receive STS-3c POH Processor block to support the Enhanced RDI-P (ERDI-P). In this mode, the Receive STS-3c POH Processor block will monitor bits 5, 6 and 7, within the G1 byte, in order to declare and clear the RDI-P defect condition.
1	REI-P Error Type	R/W	**REI-P Error Type:** This READ/WRITE bit-field permits the user to specify how the "Receive STS-3c POH Processor block will count (or tally) REI-P events, for Performance Monitoring purposes. The user can configure the Receive STS-3c POH Processor block to increment REI-P events on either a "per-bit" or "per-frame" basis. If the user configures the Receive STS-3c POH Processor block to increment REI-P events on a "per-bit" basis, then it will increment the Receive STS-3c Path REI-P Error Count" register by the value of the lower nibble within the G1 byte of the incoming STS-3c data-stream. If the user configure the Receive STS-3c POH Processor block to increment REI-P events on a "per-frame" basis, then it will increment the "Receive STS-3c Path – REI-P Error Count" register each time it receives an STS-3c SPE, in which the lower-nibble of the G1 byte (bits 1 through 4) are set to a "non-zero" value. 0 – Configures the Receive STS-3c POH Processor block to count or tally REI-P events on a per-bit basis.

			1 – Configures the Receive STS-3c POH Processor block to count or tally REI-P events on a "per-frame" basis.
0	B3 Error Type	R/W	**B3 Error Type:** This READ/WRITE bit-field permits the user to specify how the "Receive STS-3c POH Processor block will count (or tally) B3 byte errors, for Performance Monitoring purposes. The user can configure the Receive STS-3c POH Processor block to increment B3 byte errors on either a "per-bit" or "per-frame" basis. If the user configures the Receive STS-3c POH Processor block to increment B3 byte errors on a "per-bit" basis, then it will increment the "Receive STS-3c Path - B3 Byte Error Count" register by the number of bits (within the B3 byte value of the incoming STS-3c data-stream) that is in error. If the user configures the Receive STS-3c POH Processor block to increment B3 byte errors on a "per-frame" basis, then it will increment the "Receive STS-3c Path – B3 Byte Error Count" Register each time that it receives an STS-3c SPE that contains an erred B3 byte. 0 – Configures the Receive STS-3c POH Processor block to count B3 byte errors on a "per-bit" basis. 1 – Configures the Receive STS-3c POH Processor block to count B3 byte errors on a "per-frame" basis.

Table 121: Receive STS-3c Path – Receive Status Register – Byte 1 (Address Location= 0x1186)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused							Path Trace Message Unstable Defect Declared
R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 1	Unused	R/O	
0	Path Trace Message Unstable Defect Declared	R/O	**Path Trace Message Unstable Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-3c POH Processor block is currently declaring the Path Trace Message Unstable defect condition. The Receive STS-3c POH Processor block will declare the Path Trace Message Unstable defect condition, whenever the "Path Trace Message Unstable" counter reaches the value "8". The "Path Trace Message Unstable" counter will be incremented for each time that it receives a Path Trace message that differs from the previously received message. The "Path Trace Message Unstable" counter is cleared to "0" whenever the Receive STS-3c POH Processor block has received a given Path Trace Message 3 (or 5) consecutive times. ***Note:*** *Receiving a given Path Trace Message 3 (or 5) consecutive times also sets this bit-field to "0".* 0 – Indicates that the Receive STS-3c POH Processor block is NOT currently declaring the Path Trace Message Unstable defect condition. 1 – Indicates that the Receive STS-3c POH Processor block is currently declaring the Path Trace Message Unstable defect condition.

Table 122: Receive STS-3c Path – SONET Receive Status Register – Byte 0 (Address Location= 0x1187)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
TIM-P Defect Declared	C2 Byte Unstable Defect Declared	UNEQ-P Defect Declared	PLM-P Defect Declared	RDI-P Defect Declared	RDI-P Unstable Condition	LOP-P Defect Declared	AIS-P Defect Declared
R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	TIM-P Defect Declared	R/O	**Trace Identification Mismatch (TIM-P) Defect Indicator:** This READ-ONLY bit-field indicates whether or not the Receive STS-3c POH Processor block is currently declaring the "Path Trace Identification Mismatch" (TIM-P) defect condition. The Receive STS-3c POH Processor block will declare the "TIM-P" defect condition, when none of the received 64-byte string (received via the J1 byte, within the incoming STS-3c data-stream) matches the expected 1, 16 or 64-byte message. The Receive STS-3c POH Processor block will clear the "TIM-P" defect condition, when 80% of the received 1, 16 or 64-byte string (received via the J1 byte) matches the expected 1, 16 or 64-byte message. 0 – Indicates that the Receive STS-3c POH Processor block is NOT currently declaring the TIM-P defect condition. 1 – Indicates that the Receive STS-3c POH Processor block is currently declaring the TIM-P defect condition.
6	C2 Byte Unstable Defect Declared	R/O	**C2 Byte (Path Signal Label Byte) Unstable Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-3c POH Processor block is currently declaring the "Path Signal Label Byte" Unstable defect condition. The Receive STS-3c POH Processor block will declare the C2 (Path Signal Label Byte) Unstable defect condition, whenever the "C2 Byte Unstable" counter reaches the value "5". The "C2 Byte Unstable" counter will be incremented for each time that it receives an STS-3c SPE with a C2 byte value that differs from the previously received C2 byte value. The "C2 Byte Unstable" counter is cleared to "0" whenever the Receive STS-3c POH Processor block has received 3 (or 5) consecutive STS-3c SPEs that each contain the same C2 byte value. ***Note:*** *Receiving a given C2 byte value in 3 (or 5) consecutive SPEs also sets this bit-field to "0".* 0 – Indicates that the Receive STS-3c POH Processor block is currently NOT declaring the C2 (Path Signal Label Byte) Unstable defect condition. 1 – Indicates that the Receive STS-3c POH Processor block is currently declaring the C2 (Path Signal Label Byte) Unstable defect condition.
5	UNEQ-P Defect Declared	R/O	**Path – Unequipped Indicator (UNEQ-P) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-3c POH Processor block is currently declaring the UNEQ-P defect condition. The Receive STS-3c POH Processor block will declare the UNEQ-P defect condition anytime that it receives at least five (5) consecutive STS-3c frames, in which the C2 byte was set to 0x00 (which indicates that the STS-3c SPE is

			"Unequipped"). The Receive STS-3c POH Processor block will clear the UNEQ-P defect condition, if it receives at least five (5) consecutive STS-3c frames, in which the C2 byte was set to a value other than 0x00. 0 – Indicates that the Receive STS-3c POH Processor block is currently NOT declaring the UNEQ-P defect condition. 1 – Indicates that the Receive STS-3c POH Processor block is currently declaring the UNEQ-P defect condition. ***Note:*** *1. The Receive STS-3c POH Processor block will not declare the UNEQ-P defect condition if it configured to expect to receive STS-3c frames with C2 bytes being set to "0x00" (e.g., if the "Receive STS-3c Path – Expected Path Label Value" Register is set to "0x00").* *2. The Address Locations of the "Receive STS-3c Path – Expected Path Label Value" Register is 0x1197*
4	PLM-P Defect Declared	R/O	**Path Payload Mismatch Indicator (PLM-P) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-3c POH Processor block is currently declaring the PLM-P defect condition. The Receive STS-3c POH Processor block will declare the PLM-P defect condition, if it receives at least five (5) consecutive STS-3c frames, in which the C2 byte was set to a value other than that which it is expecting to receive. Whenever the Receive STS-3c POH Processor block is determining whether or not it should declare the PLM-P defect, it will check the contents of the following two registers. • The "Receive STS-3c Path – Received Path Label Value" Register (Address Location = 0x1196) • The "Receive STS-3c Path – Expected Path Label Value" Register (Address Location = 0x1197) The "Receive STS-3c Path – Expected Path Label Value" Register contains the value of the C2 bytes, that the Receive STS-3c POH Processor blocks expects to receive. The "Receive STS-3c Path – Received Path Label Value" Register contains the value of the C2 byte, that the Receive STS-3c POH Processor block has most received "validated" (by receiving this same C2 byte in five consecutive SONET frames). The Receive STS-3c POH Processor block will declare the PLM-P defect condition if the contents of these two register do not match. The Receive STS-3c POH Processor block will clear the PLM-P defect condition if whenever the contents of these two registers do match. 0 – Indicates that the Receive STS-3c POH Processor block is currently NOT declaring the PLM-P defect condition. 1 – Indicates that the Receive STS-3c POH Processor block is currently declaring the PLM-P defect condition. ***Note:*** *The Receive STS-3c POH Processor block will clear the PLM-P defect, upon declaring the UNEQ-P defect condition.*
3	RDI-P Defect Declared	R/O	**Path Remote Defect Indicator (RDI-P) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-3c POH Processor block is currently declaring the RDI-P defect condition. If the Receive STS-3c POH Processor block is configured to support the "Single-bit RDI-P" function, then it will declare the RDI-P defect condition if Bit 5 (within the G1 byte of the incoming STS-3c frame) is set to "1" for "RDI-

			P_THRD" number of incoming consecutive STS-3c SPEs. If the Receive STS-3c POH Processor block is configured to support the Enhanced RDI-P" (ERDI-P) function, then it will declare the RDI-P defect condition if Bits 5, 6 and 7 (within the G1 byte of the incoming STS-3c frame) are set to [0, 1, 0], [1, 0, 1] or [1, 1, 0] for "RDI-P_THRD" number of consecutive STS-3c SPEs. 0 – Indicates that the Receive STS-3c POH Processor block is NOT currently declaring the RDI-P defect condition. 1 – Indicates that the Receive STS-3c POH Processor block is currently declaring the RDI-P defect condition. ***Note:*** *1. The user can specify the value for "RDI-P_THRD" by writing the appropriate data into Bits 3 through 0 (RDI-P THRD) within the "Receive STS-3c Path – SONET Receive RDI-P Register.* *2. The Address Location of the "Receive STS-3c Path – SONET Receive RDI-P Registers is 0x1193*
2	RDI-P Unstable Defect Declared	R/O	**RDI-P (Path – Remote Defect Indicator) Unstable Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-3c POH Processor block is currently declaring the "RDI-P Unstable" defect condition. The Receive STS-3c POH Processor block will declare a "RDI-P Unstable" defect condition whenever the "RDI-P Unstable Counter" reaches the value "RDI-P THRD". The "RDI-P Unstable" counter is incremented for each time that the Receive STS-3c POH Processor block receives an RDI-P value that differs from that of the previous STS-3c frame. The "RDI-P Unstable" counter is cleared to "0" whenever the same RDI-P value is received in "RDI-P_THRD" consecutive STS-3c frames. ***Note:*** *Receiving a given RDI-P value, in "RDI-P_THRD" consecutive STS-3c frames also clears this bit-field to "0".* 0 – Indicates that the Receive STS-3c POH Processor block is NOT currently declaring the "RDI-P Unstable" defect condition. 1 – Indicates that the Receive STS-3c POH Processor block is currently declaring the "RDI-P Unstable" defect condition. ***Note:*** *1. The user can specify the value for "RDI-P_THRD" by writing the appropriate data into Bits 3 through 0 (RDI-P THRD) within the "Receive STS-3c Path – SONET Receive RDI-P Register.* *2. The Address Location of the Receive STS-3c Path – SONET Receive RDI-P Registers is 0x1193*
1	LOP-P Defect Declared	R/O	**Loss of Pointer Indicator (LOP-P) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-3c POH Processor block is currently declaring the LOP-P (Loss of Pointer) defect condition. The Receive STS-3c POH Processor block will declare the LOP-P defect condition, if it cannot detect a valid pointer (H1 and H2 bytes, within the TOH) within 8 to 10 consecutive SONET frames. Further, the Receive STS-3c POH Processor block will declare the LOP-P defect condition, if it detects 8 to 10 consecutive NDF events. The Receive STS-3c POH Processor block will clear the LOP-P defect condition, whenever the Receive STS-3c POH Processor detects valid pointer bytes (e.g., the H1 and H2 bytes, within the TOH) and normal NDF value for three consecutive incoming STS-3c frames. 0 – Indicates that the Receive STS-3c POH Processor block is NOT currently

			declaring the LOP-P defect condition. 1 – Indicates that the Receive STS-3c POH Processor block is currently declaring the LOP-P defect condition.
0	AIS-P Defect Declared	R/O	**Path AIS (AIS-P) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-3c POH Processor block is currently declaring the AIS-P defect condition. The Receive STS-3c POH Processor block will declare the AIS-P defect condition if it detects all of the following conditions within three consecutive incoming STS-3c frames. a. The H1, H2 and H3 bytes are set to an “All Ones” pattern. b. The entire SPE is set to an “All Ones” pattern. The Receive STS-3c POH Processor block will clear the AIS-P defect condition when it detects a valid STS-3c pointer (H1 and H2 bytes) and a “set” or “normal” NDF for three consecutive STS-3c frames. 0 – Indicates that the Receive STS-3c POH Processor block is NOT currently declaring the AIS-P defect condition. 1 – Indicates that the Receive STS-3c POH Processor block is currently declaring the AIS-P defect condition. ***Note:*** *The Receive STS-3c POH Processor block will NOT declare the LOP-P defect condition if it detects an “All Ones” pattern in the H1, H2 and H3 bytes. It will, instead, declare the AIS-P defect condition.*

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Unused	R/O	
6	Change in AIS-C Defect Condition Interrupt Status	RUR	**Change in AIS-C (AIS Concatenation) Defect Condition Interrupt Status:** This RESET-upon-READ bit-field permits indicates whether or not the "Change in AIS-C Defect Condition" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then an interrupt will be generated in response to either of the following events. a. Whenever the Receive STS-3c POH Processor block declares the AIS-C defect condition with one of the STS-1 time-slots"; within the incoming STS-3c signal. b. Whenever the Receive STS-3c POH Processor block clears the AIS-C defect condition with one of the "STS-1 time-slots"; within the incoming STS-3c signal. 0 – Indicates that the "Change in AIS-C Defect Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change in AIS-C Defect Condition" Interrupt has occurred since the last read of this register. ***Note:*** *The user can determine the current state of AIS-C by reading out the contents of the "Receive STS-3c Path – AIS-C Status" Register (Address Locations: 0x11B3).*
5	Change in LOP-C Defect Condition Interrupt Status	RUR	**Change in LOP-C (Loss of Pointer - Concatenation) Defect Condition Interrupt Status:** This RESET-upon-READ bit-field permits indicates whether or not the "Change in LOP-C Defect Condition" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then an interrupt will be generated in response to either of the following events. a. Whenever the Receive STS-3c POH Processor block declares the LOP-C defect condition with one of the "STS-1 time-slots"; within the incoming STS-3c signal. b. Whenever the Receive STS-3c POH Processor block clears the LOP-C defect condition with one of the "STS-1 timeslots"; within the incoming STS-3c signal.

			0 – Indicates that the "Change in LOP-C Defect Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change in LOP-C Defect Condition" Interrupt has occurred since the last read of this register. ***Note:*** *The user can determine the current state of the LOP-C defect by reading out the contents of the "Receive STS-3c Path – LOP-C Status" Register (Address Locations: 0x11AB).*
4	Detection of AIS Pointer Interrupt Status	RUR	**Detection of AIS Pointer Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of AIS Pointer" interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate this interrupt anytime it detects an "AIS Pointer" in the incoming STS-3c data stream. ***Note:*** *An "AIS Pointer" is defined as a condition in which both the H1 and H2 bytes (within the TOH) are each set to an "All Ones" pattern.* 0 – Indicates that the "Detection of AIS Pointer" interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of AIS Pointer" interrupt has occurred since the last read of this register.
3	Detection of Pointer Change Interrupt Status	RUR	**Detection of Pointer Change Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of Pointer Change" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate an interrupt anytime it accepts a new pointer value (e.g., H1 and H2 bytes, in the TOH bytes). 0 – Indicates that the "Detection of Pointer Change" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of Pointer Change" Interrupt has occurred since the last read of this register.
2	POH Capture Interrupt Status	RUR	**Path Overhead Data Capture Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "POH Capture" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate an interrupt once the Z5 byte (e.g., the last POH byte) has been loaded into the POH Capture Buffer. The contents of the POH Capture Buffer will remain intact for one SONET frame period. Afterwards, the POH data, for the next SPE will be loaded into the "POH Capture" buffer. 0 – Indicates that the "POH Capture" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "POH Capture" Interrupt has occurred since the last read of this register. ***Note:*** *The user can obtain the contents of the POH, within the most recently received SPE by reading out the contents of address locations "0xN0D3" through "0xN0F3").*

1	Change in TIM-P Defect Condition Interrupt Status	RUR	**Change in TIM-P (Trace Identification Mismatch) Defect Condition Interrupt.** This RESET-upon-READ bit-field indicates whether or not the "Change in TIM-P" Defect Condition interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate an interrupt in response to either of the following events. • Whenever the Receive STS-3c POH Processor block declares theTIM-P defect condition. • Whenever the Receive STS-3c POH Processor block clears the TIM-P defect condition. 0 – Indicates that the "Change in TIM-P Defect Condition" Interrupt has not occurred since the last read of this register. 1 – Indicates that the "Change in TIM-P Defect Condition" Interrupt has occurred since the last read of this register.
0	Change in Path Trace Message Unstable Defect Condition Interrupt Status	RUR	**Change in Path Trace Identification Message Unstable Defect Condition" Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in Path Trace Message Unstable Defect Condition" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate this interrupt in response to either of the following events. • Whenever the Receive STS-3c POH Processor block declare the "Path Trace Message Unstable" Defect Condition. • Whenever the Receive STS-3c POH Processor block clears the "Path Trace Message Unstable" defect condition. 0 – Indicates that the "Change in Path Trace Message Unstable Defect Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change in Path Trace Message Unstable Defect Condition" Interrupt has occurred since the last read of this register.

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	New Path Trace Message Interrupt Status	RUR	**New Path Trace Message Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "New Path Trace Message" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate an interrupt anytime it has accepted (or validated) and new Path Trace Message. 0 – Indicates that the "New Path Trace Message" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "New Path Trace Message" Interrupt has occurred since the last read of this register.
6	Detection of REI-P Event Interrupt Status	RUR	**Detection of REI-P Event Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of REI-P Event" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate an interrupt anytime it detects an REI-P event within the incoming STS-3c data-stream. 0 – Indicates that the "Detection of REI-P Event" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of REI-P Event" Interrupt has occurred since the last read of this register.
5	Change in UNEQ-P Defecft Condition Interrupt Status	RUR	**Change in UNEQ-P (Path – Unequipped) Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in UNEQ-P Defect Condition" interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate an interrupt in response to either of the following conditions. • Whenever the Receive STS-3c POH Processor block declares the UNEQ-P Defect Condition. • Whenever the Receive STS-3c POH Processor block clears the UNEQ-P Defect Condition. 0 – Indicates that the "Change in UNEQ-P Defecft Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change in UNEQ-P Defect Condition" Interrupt has

			occurred since the last read of this register. ***Note:*** *1. The user can determine the current state of the UNEQ-P defect condition by reading out the state of Bit 5 (UNEQ-P Defect Declared) within the "Receive STS-3c Path – SONET Receive POH Status – Byte 0" Register.* *2. The Address Location of the Receive STS-3c Path – SONET Receive POH Status – Byte 0" Registers is 0x1187*
4	Change in PLM-P Defect Condition Interrupt Status	RUR	**Change in PLM-P (Path – Payload Mismatch) Defect Condition Interrupt Status:** This RESET-upon-READ bit indicates whether or not the "Change in PLM-P Defect Condition" interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate an interrupt in response to either of the following conditions. • When the Receive STS-3c POH Processor block declares the "PLM-P" Defect Condition. • When the Receive STS-3c POH Processor block clears the "PLM-P" Defect Condition. 0 – Indicates that the "Change in PLM-P Defect Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change in PLM-P Defect Condition" Interrupt has occurred since the last read of this register.
3	New C2 Byte Interrupt Status	RUR	**New C2 Byte Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "New C2 Byte" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate an interrupt anytime it has accepted a new C2 byte. 0 – Indicates that the "New C2 Byte" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "New C2 Byte" Interrupt has occurred since the last read of this register.
2	Change in C2 Byte Unstable Defect Condition Interrupt Status	RUR	**Change in C2 Byte Unstable Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in C2 Byte Unstable Defect Condition" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate an interrupt in response to either of the following events. • When the Receive STS-3c POH Processor block declares the "C2 Byte Unstable" defect condition. • When the Receive STS-3c POH Processor block clears the "C2 Byte Unstable" defect condition. 0 – Indicates that the "Change in C2 Byte Unstable Defect Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change in C2 Byte Unstable Defect Condition" Interrupt has occurred since the last read of this register. ***Note:*** 1. The user can determine the current state of "C2 Byte Unstable Defect Condition" by reading out the state of Bit 6 (C2 Byte Unstable Defect

			Declared) within the "Receive STS-3c Path – SONET Receive POH Status – Byte 0" Register. *2. The Address Location of the Receive STS-3c Path – SONET Receive POH Status – Byte 0" Register is 0x1187*
1	Change in RDI-P Unstable Defect Condition Interrupt Status	RUR	**Change in RDI-P Unstable Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in RDI-P Unstable Condition" interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate an interrupt in response to either of the following conditions. • When the Receive STS-3c POH Processor block declares an "RDI-P Unstable" defect condition. • When the Receive STS-3c POH Processor block clears the "RDI-P Unstable" defect condition. 0 – Indicates that the "Change in RDI-P Unstable Defect Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change in RDI-P Unstable Defect Condition" Interrupt has occurred since the last read of this register. ***Note:*** 1. The user can determine the current state of "RDI-P Unstable Defectg condition" by reading out the state of Bit 2 (RDI-P Unstable Defect Declared) within the "Receive STS-3c Path – SONET Receive POH Status – Byte 0" Register. *2. The Address Location of the Receive STS-3c Path – SONET Receive POH Status – Byte 0" Register is 0x1187*
0	New RDI-P Value Interrupt Status	RUR	**New RDI-P Value Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "New RDI-P Value" interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate this interrupt anytime it receives and "validates" a new RDI-P value. 0 – Indicates that the "New RDI-P Value" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "New RDI-P Value" Interrupt has occurred since the last read of this register. ***Note:*** 1. The user can obtain the "New RDI-P Value" by reading out the contents of the "RDI-P ACCEPT[2:0]" bit-fields. These bit-fields are located in Bits 6 through 4, within the "Receive STS-3c Path – SONET Receive RDI-P Register". *2. The Address Location of the Receive STS-3c Path – SONET Receive POH Status – Byte 0" Register is 0x1193*

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Detection of B3 Byte Error Interrupt Status	RUR	**Detection of B3 Byte Error Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of B3 Byte Error" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate an interrupt anytime it detects a B3 byte error in the incoming STS-3c data stream. 0 – Indicates that the "Detection of B3 Byte Error" Interrupt has NOT occurred since the last read of this interrupt. 1 – Indicates that the "Detection of B3 Byte Error" Interrupt has occurred since the last read of this interrupt.
6	Detection of New Pointer Interrupt Status	RUR	**Detection of New Pointer Interrupt Status:** This RESET-upon-READ indicates whether the "Detection of New Pointer" interrupt has occurred since the last read of this register. If the user enables this interrupt, then the Receive STS-3c POH Processor block will generate an interrupt anytime it detects a new pointer value in the incoming STS-3c frame. ***Note:*** *Pointer Adjustments with NDF will not generate this interrupt.* 0 – Indicates that the "Detection of New Pointer" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of New Pointer" Interrupt has occurred since the last read of this register.
5	Detection of Unknown Pointer Interrupt Status	RUR	**Detection of Unknown Pointer Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of Unknown Pointer" interrupt has occurred since the last read of this register. If the user enables this interrupt, then the Receive STS-3c POH Processor block will generate an interrupt anytime that it detects a "pointer" that does not fit into any of the following categories. • An Increment Pointer • A Decrement Pointer • An NDF Pointer • An AIS (e.g., All Ones) Pointer • New Pointer 0 – Indicates that the "Detection of Unknown Pointer" interrupt has NOT

			occurred since the last read of this register. 1 – Indicates that the "Detection of Unknown Pointer" interrupt has occurred since the last read of this register.
4	Detection of Pointer Decrement Interrupt Status	RUR	**Detection of Pointer Decrement Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of Pointer Decrement" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate an interrupt anytime it detects a "Pointer Decrement" event. 0 – Indicates that the "Detection of Pointer Decrement" interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of Pointer Decrement" interrupt has occurred since the last read of this register.
3	Detection of Pointer Increment Interrupt Status	RUR	**Detection of Pointer Increment Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of Pointer Increment" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate an interrupt anytime it detects a "Pointer Increment" event. 0 – Indicates that the "Detection of Pointer Increment" interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of Pointer Increment" interrupt has occurred since the last read of this register.
2	Detection of NDF Pointer Interrupt Status	RUR	**Detection of NDF Pointer Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of NDF Pointer" interrupt has occurred since the last read of this register. If the user enables this interrupt, then the Receive STS-3c POH Processor block will generate an interrupt anytime it detects an NDF Pointer event. 0 – Indicates that the "Detection of NDF Pointer" interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of NDF Pointer" interrupt has occurred since the last read of this register.
1	Change of LOP-P Defect Condition Interrupt Status	RUR	**Change of LOP-P Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in LOP-P Defect Condition" interrupt has occurred since the last read of this register. If the user enables this interrupt, then the Receive STS-3c POH Processor block will generate an interrupt in response to either of the following events. a. Whenever the Receive STS-3c POH Processor block declares the "LOP-P" defect condition. b. Whenever the Receive "STS-3c POH Processor" block clears the LOP-P defect condition. 0 – Indicates that the "Change in LOP-P Defect Condition" interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change in LOP-P Defect Condition" interrupt has occurred since the last read of this register.

			Note: *1. The user can determine if the Receive STS-3c POH Processor block is currently declaring the LOP-P defect condition by reading out the state of Bit 1 (LOP-P Defect Declared) within the "Receive STS-3c Path – SONET Receive POH Status – Byte 0" Register.* *2. The Address Location of the "Receive STS-3c Path – SONET Receive POH Status – Byte 0" Register is 0x1187*
0	Change of AIS-P Defect Condition Interrupt Status	RUR	**Change of AIS-P Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change of AIS-P Defect Condition" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate an interrupt in response to either of the following events. • Whenever the Receive STS-3c POH Processor block declares the AIS-P defect condition. • Whenever the Receive STS-3c POH Processor block clears the AIS-P defect condition. 0 – Indicates that the "Change of AIS-P Defect Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change of AIS-P Defect Condition" Interrupt has occurred since the last read of this register. ***Note:*** *1. The user can determine if the Receive STS-3c POH Processor block is currently declaring the AIS-P defect condition by reading out the state of Bit 0 (AIS-P Defect Declared) within the "Receive STS-3c Path – SONET Receive POH Status – Byte 0" Register.* *2. The Address Location of the Receive STS-3c Path – SONET Receive POH Status – Byte 0" Registers is 0x1187*

7	New K3 Byte Interrupt Enable	R/W	**New K3 Byte Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "New K3 Byte" Interrupt. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate an interrupt anytime it has accepted (or validated) and new K3 Byte. 0 – Disables the "New K3 Byte" Interrupt. 1 – Enables the "New K3 Byte" Interrupt.
6	Change in AIS-C Defect Condition Interrupt Enable	R/W	**Change in AIS-C (AIS Concatenation) Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in AIS-C Defect Condition" Interrupt. If this interrupt is enabled, then an interrupt will generated in response to either of the following events. a. Whenever the Receive STS-3c POH Processor block declares the AIS-C defect condition within one of the STS-1 time-slots; within the incoming STS-3c signal. b. Whenever the Receive STS-3c POH Processor block clears the AIS-C defect condition with one of the STS-1 time-slots; within the incoming STS-3c signal. 0 – Disables the "Change in AIS-C Defect Condition" Interrupt. 1 – Enables the "Change in AIS-C Defect Condition" Interrupt ***Note:*** *This bit-field is only valid if the XRT94L33 is receiving an STS-3c signal.* *This bit-field is only valid for the following Address Locations: "0x118D" (for STS-3c)*
5	Change in LOP-C Condition Interrupt Enable	R/W	**Change in LOP-C (Loss of Pointer - Concatenation) Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in LOP-C Defect Condition" Interrupt. If this interrupt is enabled, then an interrupt will generated in response to either of the following events.

			a. Whenever the Receive STS-3c POH Processor block declares the LOP-C defect condition with one of the STS-1 timeslots; within the incoming STS-3c signal. b. Whenever the Receive STS-3c POH Processor block clears the LOP-C defect condition with one of the STS-1 timeslots; within the incoming STS-3c signal. 0 – Disables the "Change in LOP-C Defect Condition" Interrupt. 1 – Enables the "Change in LOP-C Defect Condition" Interrupt ***Note:*** *This bit-field is only valid if the XRT94L33 is receiving an STS-3c signal.* *This bit-field is only valid for the following Address Locations: "0x118D" (for STS-3c)*
4	Detection of AIS Pointer Interrupt Enable	R/W	**Detection of AIS Pointer Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of AIS Pointer" interrupt. If the user enables this interrupt, then the Receive STS-3c POH Processor block will generate an interrupt anytime it detects an "AIS Pointer", in the incoming STS-3c data stream. ***Note:*** *An "AIS Pointer" is defined as a condition in which both the H1 and H2 bytes (within the TOH) are each set to an "All Ones" Pattern.* 0 – Disables the "Detection of AIS Pointer" Interrupt. 1 – Enables the "Detection of AIS Pointer" Interrupt.
3	Detection of Pointer Change Interrupt Enable	R/W	**Detection of Pointer Change Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of Pointer Change" Interrupt. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate an interrupt anytime it has accepted a new pointer value. 0 – Disables the "Detection of Pointer Change" Interrupt. 1 – Enables the "Detection of Pointer Change" Interrupt.
2	POH Capture Interrupt Enable	R/W	**Path Overhead Data Capture Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "POH Capture" Interrupt. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate an interrupt once the Z5 byte (e.g., the last POH byte) has been loaded into the POH Capture Buffer. The contents of the POH Capture Buffer will remain intact for one SONET frame period. Afterwards, the POH data for the next SPE will be loaded into the "POH Capture" Buffer. 0 – Disables the "POH Capture" Interrupt 1 – Enables the "POH Capture" Interrupt.
1	Change in TIM-P Defect Condition Interrupt Enable	R/W	**Change in TIM-P (Trace Identification Mismatch) Defect Condition Interrupt:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in TIM-P Condition" interrupt. If this interrupt is enabled, then the Receive STS-3c POH Processor

			block will generate an interrupt in response to either of the following events. • Whenever the Receive STS-3c POH Processor block declares the TIM-P defect condition. • Whenever the Receive STS-3c POH Processor block clears the TIM-P defect condition. 0 – Disables the "Change in TIM-P Condition" Interrupt. 1 – Enables the "Change in TIM-P Condition" Interrupt.
0	Change in Path Trace Message Unstable Defect Condition Interrupt Enable	R/W	**Change in "Path Trace Message Unstable Defect Condition" Interrupt Status:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in Path Trace Message Unstable Defect Condition" Interrupt. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate an interrupt in response to either of the following events. • Whenever the Receive STS-3c POH Processor block declares the "Path Trace Message Unstable" defect Condition. • Whenever the Receive STS-3c POH Processor block clears the "Path Trace Message Unstable" defect Condition. 0 – Disables the "Change in Path Trace Message Unstable Defect Condition" interrupt. 1 – Enables the "Change in Path Trace Message Unstable Defect Condition" interrupt.

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	New Path Trace Message Interrupt Enable	R/W	**New Path Trace Message Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "New Path Trace Message" Interrupt. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate an interrupt anytime it has accepted (or validated) and new Path Trace Message. 0 – Disables the "New Path Trace Message" Interrupt. 1 – Enables the "New Path Trace Message" Interrupt.
6	Detection of REI-P Event Interrupt Enable	R/W	**Detection of REI-P Event Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of REI-P Event" Interrupt. If this interrupt is enabled, then he Receive STS-3c POH Processor block will generate an interrupt anytime it detects an REI-P event within the coming STS-3c data-stream. 0 – Disables the "Detection of REI-P Event" Interrupt. 1 – Enables the "Detection of REI-P Event" Interrupt.
5	Change in UNEQ-P Defect Condition Interrupt Enable	R/W	**Change in UNEQ-P (Path – Unequipped) Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in UNEQ-P Defect Condition" interrupt. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate an interrupt in response to either of the following conditions. • Whenever the Receive STS-3c POH Processor block declares the UNEQ-P Defect Condition. • Whenever the Receive STS-3c POH Processor block clears the UNEQ-P Defect Condition. 0 – Disables the "Change in UNEQ-P Defect Condition" Interrupt. 1 – Enables the "Change in UNEQ-P Defect Condition" Interrupt.
4	Change in PLM-P Defect Condition Interrupt Enable	R/W	**Change in PLM-P (Path – Payload Label Mismatch) Defect Condition Interrupt Enable:** This READ/WRITE bit permits the user to either enable or disable the "Change in PLM-P Defect Condition" interrupt. If this interrupt is enabled, then the Receive STS-3c POH Processor block

			will generate an interrupt in response to either of the following conditions. • Whenever the Receive STS-3c POH Processor block declares the "PLM-P" Defect Condition. • Whenever the Receive STS-3c POH Processor block clears the "PLM-P" Defect Condition. 0 – Disables the "Change in PLM-P Defect Condition" Interrupt. 1 – Enables the "Change in PLM-P Defect Condition" Interrupt.
3	New C2 Byte Interrupt Enable	R/W	**New C2 Byte Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "New C2 Byte" Interrupt. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate an interrupt anytime it has accepted a new C2 byte. 0 – Disables the "New C2 Byte" Interrupt. 1 – Enables the "New C2 Byte" Interrupt. ***Note:*** *1. The user can obtain the value of this "New C2" byte by reading the contents of the "Receive STS-3c Path – Received Path Label Value" Register.* *2. The Address Location of the Receive STS-3c Path – Received Path Label Value" Register is 0x1196*
2	Change in C2 Byte Unstable Defect Condition Interrupt Enable	R/W	**Change in C2 Byte Unstable Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in C2 Byte Unstable Defect Condition" Interrupt. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate an interrupt in response to either of the following events. • Whenever the Receive STS-3c POH Processor block declares the "C2 Byte Unstable" defect condition. • Whenever the Receive STS-3c POH Processor block clears the "C2 Byte Unstable" defect condition. 0 – Disables the "Change in C2 Byte Unstable Condition" Interrupt. 1 – Enables the "Change in C2 Byte Unstable Condition" Interrupt.
1	Change in RDI-P Unstable Defect Condition Interrupt Enable	R/W	**Change in RDI-P Unstable Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in RDI-P Unstable Defect Condition" interrupt. If this interrupt is enabled, then the Receive STS-3c POH Processor block will generate an interrupt in response to either of the following conditions. • Whenever the Receive STS-3c POH Processor block declares an "RDI-P Unstable defect" condition. • Whenever the Receive STS-3c POH Processor block clears the "RDI-P Unstable defect" condition. 0 – Disables the "Change in RDI-P Unstable Defect Condition" Interrupt. 1 – Enables the "Change in RDI-P Unstable Defect Condition" Interrupt.
0	New RDI-P Value Interrupt Enable	R/W	**New RDI-P Value Interrupt Enable**: This READ/WRITE bit-field permits the user to either enable or disable the "New RDI-P Value" interrupt. If this interrupt is enabled, then the Receive STS-3c POH Processor block

			will generate this interrupt anytime it receives and "validates" a new RDI-P value. 0 – Disables the "New RDI-P Value" Interrupt. 1 – Enable the "New RDI-P Value" Interrupt.

Table 128: Receive STS-3c Path – SONET Receive Path Interrupt Enable – Byte 0 (Address Location= 0x118F)

0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Detection of B3 Byte Error Interrupt Enable	R/W	**Detection of B3 Byte Error Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of B3 Byte Error" Interrupt. If the user enables this interrupt, then the Receive STS-3c POH Processor block will generate an interrupt anytime it detects a B3-byte error in the incoming STS-3c data-stream. 0 – Disables the "Detection of B3 Byte Error" interrupt. 1 – Enables the "Detection of B3 Byte Error" interrupt.
6	Detection of New Pointer Interrupt Enable	R/W	**Detection of New Pointer Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of New Pointer" interrupt. If the user enables this interrupt, then the Receive STS-3c POH Processor block will generate an interrupt anytime it detects a new pointer value in the incoming STS-3c frame. ***Note:*** *Pointer Adjustments with NDF will not generate this interrupt.* 0 – Disables the "Detection of New Pointer" Interrupt. 1 – Enables the "Detection of New Pointer" Interrupt.
5	Detection of Unknown Pointer Interrupt Enable	R/W	**Detection of Unknown Pointer Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of Unknown Pointer" interrupt. If the user enables this interrupt, then the Receive STS-3c POH Processor block will generate an interrupt anytime it detects a "Pointer Adjustment" that does not fit into any of the following categories. • An Increment Pointer. • A Decrement Pointer • An NDF Pointer • AIS Pointer • New Pointer. 0 – Disables the "Detection of Unknown Pointer" Interrupt. 1 – Enables the "Detection of Unknown Pointer" Interrupt.
4	Detection of Pointer Decrement Interrupt Enable	R/W	**Detection of Pointer Decrement Interrupt Enable:** This READ/WRITE bit-field permits the user to enable or disable the "Detection of Pointer Decrement" Interrupt. If the user enables this interrupt, then the Receive STS-3c POH Processor block will generate an

			interrupt anytime it detects a “Pointer-Decrement” event. 0 – Disables the “Detection of Pointer Decrement” Interrupt. 1 – Enables the “Detection of Pointer Decrement” Interrupt.
3	Detection of Pointer Increment Interrupt Enable	R/W	**Detection of Pointer Increment Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the “Detection of Pointer Increment” Interrupt. If the user enables this interrupt, then the Receive STS-3c POH Processor block will generate an interrupt anytime it detects a “Pointer Increment” event. 0 – Disables the “Detection of Pointer Increment” Interrupt. 1 – Enables the “Detection of Pointer Increment” Interrupt.
2	Detection of NDF Pointer Interrupt Enable	R/W	**Detection of NDF Pointer Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the “Detection of NDF Pointer” Interrupt. If the user enables this interrupt, then the Receive STS-3c POH Processor block will generate an interrupt anytime it detects an NDF Pointer event. 0 – Disables the “Detection of NDF Pointer” interrupt. 1 – Enables the “Detection of NDF Pointer” interrupt.
1	Change of LOP-P Defect Condition Interrupt Enable	R/W	**Change of LOP-P Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the “Change in LOP (Loss of Pointer)” Defect Condition interrupt. If the user enables this interrupt, then the Receive STS-3c POH Processor will generate an interrupt in response to either of the following events. a. Whenever the Receive STS-3c POH Processor block declares the LOP-P defect condition. b. Whenever the Receive STS-3c POH Processor block clears the LOP-P defect condition. 0 – Disable the “Change of LOP-P Defect Condition” Interrupt. 1 – Enables the “Change of LOP-P Defect Condition” Interrupt. ***Note:*** *1. The user can determine if the Receive STS-3c POH Processor block is currently declaring the LOP-P defect condition by reading out the contents of Bit 1 (LOP-P Defect Declared) within the “Receive STS-3c Path – SONET Receive POH Status – Byte 0”.* *2. The Address Location of the Receive STS-3c Path – SONET Receive POH Status Byte 0” Register is 0x1187*
0	Change of AIS-P Defect Condition Interrupt Enable	R/W	**Change of AIS-P Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the “Change of AIS-P (Path AIS) Defect Condition” interrupt. If the user enables this interrupt, then the Receive STS-3c POH Processor block will generate an interrupt in response to either of the following events. a. Whenever the Receive STS-3c POH Processor block declares the “AIS-P” defect condition. b. Whenever the Receive STS-3c POH Processor block clears the “AIS-P” defect condition. 0 – Disables the “Change of AIS-P Defect Condition” Interrupt. 1 – Enables the “Change of AIS-P Defect Condition” Interrupt. ***Note:***

			1. The user can determine if the Receive STS-3c POH Processor block is currently declaring the AIS-P defect condition by reading out the contents of Bit 0 (AIS-P Defect Declared) within the "Receive STS-3c Path – SONET Receive POH Status – Byte 0" Register. *2. The Address Location of the Receive STS-3c Path – SONET Receive POH Status – Byte 0" Register is 0x1187*

Table 129: Receive STS-3c Path – SONET Receive RDI-P Register (Address Location= 0x1193)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Unused	R/O	
6 – 4	RDI-P_ACCEPT[2:0]	R/O	**Accepted RDI-P Value:** These READ-ONLY bit-fields contain the value of the most recently "accepted" RDI-P (e.g., bits 5, 6 and 7 within the G1 byte) value that has been accepted by the Receive STS-3c POH Processor block. ***Note:*** *A given RDI-P value will be "accepted" by the Receive STS-3c POH Processor block, if this RDI-P value has been consistently received in "RDI-P THRESHOLD[3:0]" number of SONET frames.*
3 – 0	RDI-P THRESHOLD[3:0]	R/W	**RDI-P Threshold[3:0]:** These READ/WRITE bit-fields permit the user to defined the "RDI-P Acceptance Threshold" for the Receive STS-3c POH Processor Block. The "RDI-P Acceptance Threshold" is the number of consecutive SONET frames, in which the Receive STS-3c POH Processor block must receive a given RDI-P value, before it "accepts" or "validates" it. The most recently "accepted" RDI-P value is written into the "RDI-P ACCEPT[2:0]" bit-fields, within this register.

R/O	R/O	R/O	R/W	R/W	R/W	R/O	R/O
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 5	Unused	R/O	
5	New Message Ready	R/O	**New Message Ready:** This READ/WRITE bit-field indicates whether or not the Receive STS-3c POH Processor block has (1) accepted a new Receive Path Trace Message, and (2) has loaded this new message into the Receive Path Trace Message buffer, since the last read of this register. 0 – Indicates that the Receive STS-3c POH Processor block has (1) NOT accepted a new Path Trace Message, nor (2) has the Receive STS-3c POH Processor block loaded any new messages into the Receive Path Trace Message buffer, since the last read of this register. 1 – Indicates that the Receive STS-3c POH Processor block has (1) accepted a new Path Trace Message, and (2) has loaded this new message into the Receive Path Trace Message buffer, since the last read of this register.
4	Received Path Trace Message Buffer Read Select	R/W	**Receive Path Trace Message Buffer Read Selection:** This READ/WRITE bit-field permits a user to specify which of the following Receive Path Trace Message buffer segments that the Microprocessor will read out, whenever it reads out the contents of the Receive Path Trace Message Buffer. a. The "Actual" Receive Path Trace Message Buffer. The "Actual" Receive Path Trace Message Buffer contains the contents of the most recently received (and accepted) Path Trace Message via the incoming STS-3c data-stream. b. The "Expected" Receive Path Trace Message Buffer. The "Expected" Receive Path Trace Message Buffer contains the contents of the Path Trace Message that the user "expects" to receive. The contents of this particular buffer are usually specified by the user. 0 – Executing a READ to the Receive Path Trace Message Buffer, will return contents within the "Actual" Receive Path Trace Message" buffer. 1 – Executing a READ to the Receive Path Trace Message Buffer will return contents within the "Expected" Receive Path Trace Message Buffer". ***Note:*** *In the case of the Receive STS-3c POH Processor block, the "Receive Path Trace Message Buffer" is located at Address Location = 0x1500 through 0x153F*
3	Path Trace Message Accept Threshold	R/W	**Path Trace Message Accept Threshold:** This READ/WRITE bit-field permits a user to select the number of consecutive times that the Receive STS-3c POH Processor block must receive a given Receive Path Trace Message, before it is accepted and loaded into the

<table>
<tr><td></td><td></td><td></td><td>“Actual” Receive Path Trace Message Buffer, as described below.

0 – Configures the Receive STS-3c POH Processor block to accept the incoming Path Trace Message after it has received it the third time in succession.

1 – Configures the Receive STS-3c POH Processor block to accept the incoming Path Trace Message after it has received in the fifth time in succession.</td></tr>
<tr><td>2</td><td>Path Trace Message Alignment Type</td><td>R/O</td><td>Path Trace Message Alignment Type:

This READ/WRITE bit-field permits a user to specify how the Receive STS-3c POH Processor block will locate the boundary of the incoming Path Trace Message (within the incoming STS-3c data-stream), as indicated below.

0 – Configures the Receive STS-3c POH Processor block to expect the Path Trace Message boundary to be denoted by a “Line Feed” character.

1 – Configures the Receive STS-3c POH Processor block to except the Path Trace Message boundary to be denoted by the presence of a “1” in the MSB (most significant bit) of the first byte (within the incoming Path Trace Message). In this case, all of the remaining bytes (within the incoming Path Trace Message) will each have a “0” within their MSBs.</td></tr>
<tr><td>1 – 0</td><td>Path Trace Message Length[1:0]</td><td>R/W</td><td>Path Trace Message Length[1:0]:

These READ/WRITE bit-fields permit the user to specify the length of the Receive Path Trace Message that the Receive STS-3c POH Processor block will accept and load into the “Actual” Receive Path Trace Message Buffer. The relationship between the content of these bit-fields and the corresponding Receive Path Trace Message Length is presented below.

<table>
<tr><th>MSG LENGTH[1:0]</th><th>Resulting Path Trace Message Length</th></tr>
<tr><td>00</td><td>1 Byte</td></tr>
<tr><td>01</td><td>16 Bytes</td></tr>
<tr><td>10/11</td><td>64 Bytes</td></tr>
</table>
</td></tr>
</table>

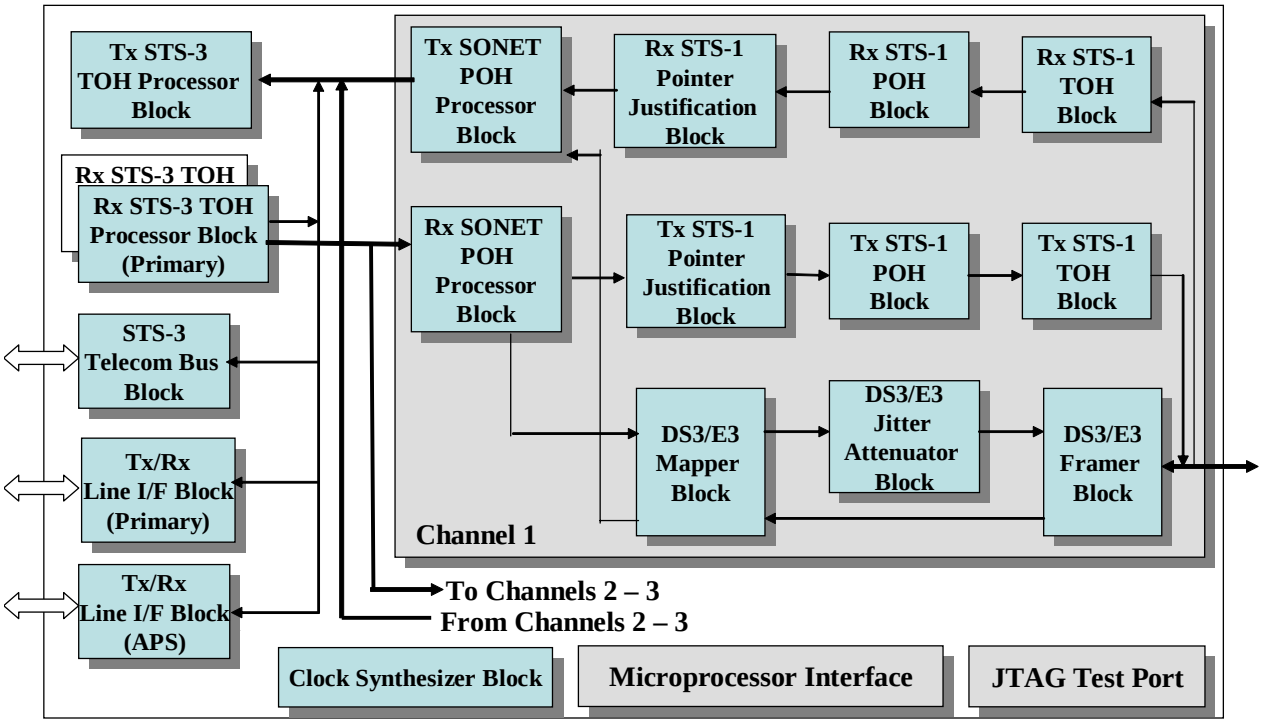
1.6 REDUNDANT RECEIVE STS-3 TOH PROCESSOR BLOCK

The register map for the Redundant Receive STS-3 TOH Processor Block is presented in the Table below. Additionally, a detailed description of each of the "Redundant Receive STS-3 TOH Processor" Block registers is presented below.

In order to provide some orientation for the reader, an illustration of the Functional Block Diagram for the XRT94L33, with the "Redundant Receive STS-3 TOH Processor Block "highlighted" is presented below in Figure 3.

NOTE: The Redundant Receive STS-3 TOH Processor block is only active if the user has configured the XRT94L33 device to support Line APS Applications.

Figure 3: Illustration of the Functional Block Diagram of the XRT94L33 (whenever it has been configured to operate in the 3-Channel DS3/STS-1 to STS-3 Mapper Mode), with the Redundant Receive STS-3 TOH Processor Block "High-lighted".



REDUNDANT RECEIVE STS-3 TOH PROCESSOR BLOCK REGISTER

Table 157: Redundant Receive STS-3 TOH Processor Block Control Register – Address Map

ADDRESS LOCATION	REGISTER NAME	DEFAULT VALUES
0x1600 – 0x1702	Reserved	
0x1703	Redundant Receive STS-3 Transport Control Register – Byte 0	0x00
0x1704 – 0x1705	Reserved	0x00
0x1706	Redundant Receive STS-3 Transport Status Register – Byte 1	0x00
0x1707	Redundant Receive STS-3 Transport Status Register – Byte 0	0x02
0x1708	Reserved	0x00
0x1709	Redundant Receive STS-3 Transport Interrupt Status Register – Byte 2	0x00
0x170A	Redundant Receive STS-3 Transport Interrupt Status Register – Byte 1	0x00
0x170B	Redundant Receive STS-3 Transport Interrupt Status Register – Byte 0	0x00
0x170C	Reserved	0x00
0x170D	Redundant Receive STS-3 Transport Interrupt Enable Register – Byte 2	0x00
0x170E	Redundant Receive STS-3 Transport Interrupt Enable Register – Byte 1	0x00
0x170F	Redundant Receive STS-3 Transport Interrupt Enable Register – Byte 0	0x00
0x1710	Redundant Receive STS-3 Transport B1 Error Count – Byte 3	0x00
0x1711	Redundant Receive STS-3 Transport B1 Error Count – Byte 2	0x00
0x1712	Redundant Receive STS-3 Transport B1 Error Count – Byte 1	0x00

1.6.1 REDUNDANT RECEIVE STS-3 TOH PROCESSOR BLOCK REGISTER DESCRIPTION

Table 158: Redundant Receive STS-3 Transport Control Register – Byte 0 (Address Location= 0x1703)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
STS-N OH Extract	SF Detect Condition Detect Enable	SD Detect Condition Defect Enable	Descramble Disable	Unused	REI-L Error Type	B2 Error Type	B1 Error Type
R/W	R/W	R/W	R/W	R/O	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	STS-N OH Extract	R/W	**STS-N Overhead Extract:** This READ/WRITE bit-field permits the user to configure the RxTOH output port to output the TOH for all lower-tributary STS-1s within the incoming STS-3 signal. 0 – Disables this feature. In this mode, the RxTOH output port will only output the TOH for the first STS-1 within the incoming STS-3 signal. 1 – Enables this feature.
6	SF Defect Condition Detect Enable	R/W	**Signal Failure (SF) Defect Condition Detect Enable:** This READ/WRITE bit-field permits the user to enable or disable SF Defect Declaration and Clearance by the Redundant Receive STS-3 TOH Processor Block, as described below. 0 – Configures the Redundant Receive STS-3 TOH Processor block to NOT declare nor clear the SF defect condition per the “user-specified” SF defect declaration and clearance criteria. 1 – Configures the Redundant Receive STS-3 TOH Processor block to declare and clear the SF defect condition per the “user-specified” SF defect declaration and clearance” critieria. **NOTE:** The user must set this bit-field to “1” in order to permit the Redundant Receive STS-3 TOH Processor block to declare and clear the SF defect condition.
5	SD Defect Condition Detect Enable	R/W	**Signal Degrade (SD) Defect Condition Detect Enable:** This READ/WRITE bit-field permits the user to enable or disable SD Defect Declaration and Clearance by the Redundant Receive STS-3 TOH Processor Block as described below. 0 – Configures the Redundant Receive STS-3 TOH Processro block to NOT declare nor clear the SD defect condition per the “user-specified” SD defect declaration and clearance criteria. 1 – Configures the Receive STS-3 TOH Processor block to declare and clear the SD defect condition per the “user-specified” SD defect declaration and clearance” criteria. **NOTE:** The user must set this bit-field to “1” in order to permit the Redundant Receive STS-3 TOH Processro block to declare and clear the SD defect condition,
4	Descramble Disable	R/W	**De-Scramble Disable:** This READ/WRITE bit-field permits the user to either enable or disable de-scrambling by the Redundant Receive STS-3 TOH Processor block.

			0 – De-Scrambling is enabled. 1 – De-Scrambling is disabled.
3	Unused	R/O	
2	REI-L Error Type	R/W	**REI-L (Line – Remote Error Indicator) Error Type:** This READ/WRITE bit-field permits the user to specify how the "Redundant Receive STS-3 TOH Processor block will count (or tally) REI-L events, for Performance Monitoring purposes. The user can configure the Redundant Receive STS-3 TOH Processor block to increment REI-L events on either a "per-bit" or "per-frame" basis. If the user configures the Redundant Receive STS-3 TOH Processor block to increment REI-L events on a "per-bit" basis, then it will increment the "Redundant Receive STS-3 Transport REI-L Event Count" registers by the contents within the M1 byte of the incoming STS-3 data-stream If the user configures the Redundant Receive STS-3 TOH Processor block to increment REI-L events on a "per-frame" basis, then it will increment the "Redundant Receive STS-3 Transport REI-L Event Count" register each time it receives an STS-3 frame, in which the M1 byte is set to a "non-zero" value. 0 – Configures the Redundant Receive STS-3 TOH Processor block to count or tally REI-L events on a per-bit basis. 1 – Configures the Redundant Receive STS-3 TOH Processor block to count or tally REI-L events on a per-frame basis.
1	B2 Error Type	R/W	**B2 Error Type:** This READ/WRITE bit-field permits the user to specify how the "Redundant Receive STS-3 TOH Processor block will count (or tally) B2 byte errors, for Performance Monitoring purposes. The user can configure the Redundant Receive STS-3 TOH Processor block to increment B2 byte errors on either a "per-bit" or "per-frame" basis. If the user configures the Redundant Receive STS-3 TOH Processor block to increment B2 byte errors on a "per-bit" basis, then it will increment the Redundant Receive STS-3 Transport - B2 Byte Error Count" register by the number of bits (within each of the three B2 byte values) that is in error. If the user configures the Redundant Receive STS-3 TOH Processor block to increment B2 byte errors on a "per-frame" basis, then it will increment the "Redundant Receive STS-3 Transport – B2 Byte Error Count" Register, each time it receives an STS-3 frame that contains at least one erred B2 byte. 0 – Configures the Redundant Receive STS-3 TOH Processor block to count B2 byte errors on a "per-bit" basis. 1 – Configures the Redundant Receive STS-3 TOH Processor block to count B2 byte errors on a "per-frame" basis.
0	B1 Error Type	R/W	**B1 Error Type:** This READ/WRITE bit-field permits the user to specify how the "Redundant Receive STS-3 TOH Processor block will count (or tally) B1 byte errors, for Performance Monitoring purposes. The user can configure the Redundant Receive STS-3 TOH Processor block to increment B1 byte errors on either a "per-bit" or "per-frame" basis. If the user configures the Redundant Receive STS-3 TOH Processor block to increment B1 byte errors on a "per-bit" basis, then it will increment the "Redundant Receive STS-3 Transport - B1 Byte Error Count" register by the number of bits (within the B1 byte value) that is in error. If the user configures the Redundant Receive STS-3 TOH Processor block to increment B1 byte errors on a "per-frame" basis, then it will increment the "Redundant Receive STS-3 Transport – B1 Byte Error Count" Register

			each time it receives an STS-3 frame that contains an erred B1 byte. 0 – Configures the Redundant Receive STS-3 TOH Processor block to count B1 byte errors on a "per-bit" basis. 1 – Configures the Redundant Receive STS-3 TOH Processor block to count B2 byte errors on a "per-frame" basis.

Table 159: Redundant Receive STS-3 Transport Status Register – Byte 1 (Address Location= 0x1706)

Unused							AIS-L Defect Declared
R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 1	Unused	R/O	
0	AIS-L Defect Declared	R/O	**AIS-L Defect Declared:** This READ-ONLY bit-field indicates whether or not the Redundant Receive STS-3 TOH Processor block is currently declaring the AIS-L (Line AIS) defect condition within the incoming STS-3 data stream. The Redundant Receive STS-3 TOH Processor block will declare the AIS-L defect condition within the incoming STS-3 data-stream if bits 6, 7 and 8 (e.g., the Least Significant Bits, within the K2 byte) are set to the value "[1, 1, 1]" for five consecutive STS-3 frames. 0 – Indicates that the Redundant Receive STS-3 TOH Processor block is NOT currently declaring the AIS-L defect condition. 1 – Indicates that the Redundant Receive STS-3 TOH Processor block is currently declaring the AIS-L defect condition.

Table 160: Redundant Receive STS-3 Transport Status Register – Byte 0 (Address Location= 0x1707)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
RDI-L Defect Declared	S1 Byte Unstable Defect Declared	K1, K2 Byte Unstable Defect Declared	SF Defect Declared	SD Defect Declared	LOF Defect Declared	SEF Defect Declared	LOS Defect Declared
R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	RDI-L Defect Declared	R/O	**RDI-L (Line Remote Defect Indicator) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Redundant Receive STS-3 TOH Processor block is currently declaring the RDI-L defect condition within the incoming STS-3 signal. The Redundant Receive STS-3 TOH Processor block will declare the RDI-L defect condition whenever it determines that bits 6, 7 and 8 (e.g., the three least significant bits) of the K2 byte contains the "1, 1, 0" pattern within 5 consecutive incoming STS-3 frames. 0 – Indicates that the Redundant Receive STS-3 TOH Processor block is NOT currently declaring the RDI-L defect condition. 1 – Indicates that the Redundant Receive STS-3 TOH Processor block is currently declaring the RDI-L defect condition.
6	S1 Byte Unstable Defect Declared	R/O	**S1 Byte Unstable Defect Declared:** This READ-ONLY bit-field indicates whether or not the Redundant Receive STS-3 TOH Processor block is currently declaring the "S1 Byte Unstable" defect condition. The Redundant Receive STS-3 TOH Processor block will declare the "S1 Byte Unstable" defect condition whenever the "S1 Byte Unstable Counter" reaches the value 32. The Redundant Receive STS-3 TOH Processor block will increment the "S1 Byte Unstable Counter" each time that it receives an STS-3 frame that contains an S1 byte that differs from the previously received S1 byte. The Redundant Receive STS-3 TOH Processor block will clear the contents of the "S1 Byte Unstable Counter" is cleared to "0" whenever it receives the same S1 byte for 8 consecutive STS-3 frames. 0 – Indicates that the Redundant Receive STS-3 TOH Processor block is NOT currently declaring the "S1 Byte Unstable" Defect Condition. 1 – Indicates that the Redundant Receive STS-3 TOH Processor block is currently declaring the S1 Byte Unstable" Defect Condition.
5	K1, K2 Byte Unstable Defect Declared	R/O	**K1, K2 Byte Unstable Defect Declared:** This READ-ONLY bit-field indicates whether or not the Redundant Receive STS-3 TOH Processor block is currently declaring the "K1, K2 Byte Unstable" defect condition. The Redundant Receive STS-3 TOH Processor block will declare the "K1, K2 Byte Unstable" defect condition whenever it fails to receive the same set of K1, K2 bytes, in 12 consecutive STS-3 frames. The Redundant Receive STS-3 TOH Processor block will clear the "K1, K2 Byte Unstable" defect condition whenever it receives a given set of K1, K2 byte values within three consecutive STS-3 frames. 0 – Indicates that the Redundant Receive STS-3 TOH Processor block is NOT currently declaring the K1, K2 Unstable Defect Condition. 1 – Indicates that the Redundant Receive STS-3 TOH Processor block is currently declaring the K1, K2 Unstable Defect Condition.
4	SF Defect Declared	R/O	**SF (Signal Failure) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Redundant Receive STS-

			3 TOH Processor block is currently declaring the SF defect condition. The Redundant Receive STS-3 TOH Processor block will declare the SF defect condition anytime it has determined that the number of B2 byte errors (measured over a user-selected period of time) exceeds a certain "user-specified" B2 Byte Error" threshold. 0 – Indicates that the Redundant Receive STS-3 TOH Processor block is NOT currently declaring the SF Defect condition. This bit is set to "0" when the number of B2 byte errors (accumulated over a given interval of time) does not exceed the "SF Defect Declaration" threshold. 1 – Indicates that the Redundant Receive STS-3 TOH Processor block is currently declaring the SF Defect condition. This bit is set to "1" when the number of B2 byte errors (accumulated over a given interval of time) does exceed the "SF Defect Declaration" threshold.
3	SD Defect Declared	R/O	**SD (Signal Degrade) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Redundant Receive STS-3 TOH Processor block is currently declaring the SD defect condition. The Redundant Receive STS-3 TOH Processor block will declare the SD defect condition anytime it has determined that the number of B2 byte errors (measured over a "user-specified" period of time) exceeds a certain "user-specified" B2 Byte Error" threshold. 0 – Indicates that the Redundant Receive STS-3 TOH Processor block is NOT currently declaring the SD Defect condition. This bit is set to "0" when the number of B2 byte errors (accumulated over a given interval of time) does not exceed the "SD Defect Declaration" threshold. 1 – Indicates that the Redundant Receive STS-3 TOH Processor block is currently declaring the SD Defect condition. This bit is set to "1" when the number of B2 byte errors (accumulated over a given interval of time) does exceed the "SD Defect Declaration" threshold.
2	LOF Defect Declared	R/O	**LOF (Loss of Frame) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Redundant Receive STS-3 TOH Processor block is currently declaring the LOF defect condition. The Redundant Receive STS-3 TOH Processor block will declare the LOF defect condition, if it has been declaring the SEF (Severely Errored Frame) defect condition for 3ms (or 24 SONET frame periods). 0 – Indicates that the Redundant Receive STS-3 TOH Processor block is NOT currently declaring the LOF defect condition. 1 – Indicates that the Redundant Receive STS-3 TOH Processor block is currently declaring the LOF defect condition.
1	SEF Defect Declared	R/O	**SEF (Severely Errored Frame) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Redundant Receive STS-3 TOH Processor block is currently declaring the SEF defect condition. The Redundant Receive STS-3 TOH Processor block will declare the SEF defect condition, if the "SEF Declaration Criteria"; per the settings of the FRPATOUT[1:0] bits, within the Redundant Receive STS-3 Transport – In-Sync Threshold Value Register (Address Location= 0x172B) are met. 0 – Indicates that the Redundant Receive STS-3 TOH Processor block is NOT currently declaring the SEF defect condition. 1 – Indicates that the Redundant Receive STS-3 TOH Processor block is currently declaring the SEF defect condition.
0	LOS Defect Declared	R/O	**LOS (Loss of Signal) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Redundant Receive STS-

	Declared		3 TOH Processor block is currently declaring the LOS (Loss of Signal) defect condition. The Redundant Receive STS-3 TOH Processor block will declare the LOS defect condition if it detects "LOS_THRESHOLD[15:0]" consecutive "All Zero" bytes in the incoming STS-3 data stream. ***Note:*** *The user can set the "LOS_THRESHOLD[15:0]" value by writing the appropriate data into the "Redundant Receive STS-3 Transport – LOS Threshold Value" Register (Address Location= 0x172E and 0x172F).* 0 – Indicates that the Redundant Receive STS-3 TOH Processor block is NOT currently declaring the LOS defect condition. 1 – Indicates that the Redundant Receive STS-3 TOH Processor block is currently declaring the LOS defect condition.

Table 161: Redundant Receive STS-3 Transport Interrupt Status Register – Byte 2 (Address Location= 0x1709)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0

7	New S1 Byte Value Interrupt Status	RUR	**New S1 Byte Value Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "New S1 Byte Value" Interrupt has occurred since the last read of this register. The Redundant Receive STS-3 TOH Processor block will generate the "New S1 Byte Value" Interrupt anytime it has "accepted" a new S1 byte, from the incoming STS-3 data-stream. 0 – Indicates that the "New S1 Byte Value" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "New S1 Byte Value" interrupt has occurred since the last read of this register. ***Note:*** *The user can obtain the value for this most recently accepted value of the S1 byte by reading the "Redundant Receive STS-3 Transport S1 Value" register (Address Location= 0x1727).*
6	Change in S1 Byte Unstable Defect Condition Interrupt Status	RUR	**Change in S1 Byte Unstable Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in S1 Byte Unstable Defect Condition" Interrupt has occurred since the last read of this register. The Redundant Receive STS-3 TOH Processor block will generate this interrupt in response to either of the following events. • Whenever the Redundant Receive STS-3 TOH Processor block declares the "S1 Byte Unstable" defect condition. • Whenever the Redundant Receive STS-3 TOH Processor block clears the "S1 Byte Unstable" defect condition. 0 – Indicates that the "Change in S1 Byte Unstable Defect Condition" Interrupt has occurred since the last read of this register. 1 – Indicates that the "Change in S1 Byte Unstable Defect Condition" Interrupt has not occurred since the last read of this register. ***Note:*** *The user can determine if the Redundant Receive STS-3 TOH Processor block is currently declaring the "S1 Byte Unstable" defect condition by reading the contents of Bit 6 (S1 Byte Unstable Defect Declared) within the "Redundant Receive STS-3 Transport Status Register – Byte 0" (Address Location = 0x1707).*
5 – 3		R/O	
2	Receive TOH CAP DONE Interrupt Status	RUR	**Receive TOH Capture DONE – Interrupt Status:** This RESET-upon-READ bit-field indicates whether the "Receive TOH Data Capture" Interrupt has occurred since the last read of this register.

			Capture" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Redundant Receive STS-3 TOH Processor block will generate an interrupt anytime it has captured the last TOH byte into the Capture Buffer. ***Note:*** *Once the TOH (of a given STS-3 frame) has been captured and loaded into the "Receive TOH Capture" buffer, it will remain there for one SONET frame period.* 0 – Indicates that the "Receive TOH Data Capture" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Receive TOH Data Capture" Interrupt has occurred since the last read of this register.
1	Change in K1, K2 Byte Unstable Defect Condition Interrupt Status	RUR	**Change of K1, K2 Byte Unstable Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in K1, K2 Byte Unstable Defect Condition" interrupt has occurred since the last read of this register. The Redundant Receive STS-3 TOH Processor block will generate this interrupt in response to either of the following events. • Whenever the Redundant Receive STS-3 TOH Processor block declares the "K1, K2 Byte Unstable Defect" condition. • Whenever the Redundant Receive STS-3 TOH Processor block clears the "K1, K2 Byte Unstable" defect condition. 0 – Indicates that the "Change of K1, K2 Byte Unstable Defect Condition" interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change of K1, K2 Byte Unstable Defect Condition" interrupt has occurred since the last read of this register. ***Note:*** *The user can determine if the Redundant Receive STS-3 TOH Processor block is currently declaring the "K1, K2 Unstable Defect Condition" by reading out the contents of Bit 5 (K1, K2 Byte Unstable Defect Declared), within the "Redundant Receive STS-3 Transport Status Register – Byte 0" (Address Location = 0x1707).*
0	NEW K1, K2 Byte Value Interrupt Status	RUR	**New K1, K2 Byte Value Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "New K1, K2 Byte Value" Interrupt has occurred since the last read of this register. The Redundant Receive STS-3 TOH Processor block will generate this interrupt whenever it has "accepted" a new set of K1, K2 byte values from the incoming STS-3 data-stream. 0 – Indicates that the "New K1, K2 Byte Value" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "New K1, K2 Byte Value" Interrupt has occurred since the last read of this register. ***Note:*** *The user can obtain the contents of the new K1 byte by reading out the contents of the "Redundant Receive STS-3 Transport K1 Byte Value" Register (Address Location= 0x171F). Further, the user can also obtain the contents of the new K2 byte by reading out the contents of the "Redundant Receive STS-3 Transport K2 Byte Value" Register (Address Location= 0x1723).*

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Change in SF Defect Condition Interrupt Status	RUR	**Change of Signal Failure (SF) Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change of SF Defect Condition Interrupt" has occurred since the last read of this register. The Redundant Receive STS-3 TOH Processor block will generate this interrupt in response to either of the following events. • Whenever the Redundant Receive STS-3 TOH Processor block declares the SF defect condition. • Whenever the Redundant Receive STS-3 TOH Processor block clears the SF defect condition. 0 – Indicates that the "Change of SF Defect Condition Interrupt" has NOT occurred since the last read of this register. 1 – Indicates that the "Change of SF Defect Condition Interrupt" has occurred since the last read of this register. ***Note:*** *The user can determine if the Redundant Receive STS-3 TOH Processor block is currently declaring the "SF" defect condition by reading out the state of Bit 4 (SF Defect Declared) within the "Redundant Receive STS-3 Transport Status Register – Byte 0 (Address Location= 0x1707).*
6	Change of SD Defect Condition Interrupt Status	RUR	**Change of Signal Degrade (SD) Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change of SD Defect Condition Interrupt" has occurred since the last read of this register. The Redundant Receive STS-3 TOH Processor block will generate this interrupt in response to either of the following events. • Whenever the Redundant Receive STS-3 TOH Processor block declares the SD Defect condition. • Whenever the Redundant Receive STS-3 TOH Processor block clears the SD Defect condition. 0 – Indicates that the "Change of SD Defect Condition Interrupt" has NOT occurred since the last read of this register. 1 – Indicates that the "Change of SD Defect Condition Interrupt" has occurred since the last read of this register. ***Note:*** *The user can determine the whether or not the Redundant Receive STS-3 TOH Processor block is currently declaring the SD defect condition by reading out the state of Bit 3 (SD Defect Declared) within the "Redundant Receive STS-3 Transport Status Register – Byte 0 (Address Location= 0x1707).*
5	Detection of REI-	RUR	**Detection of REI-L (Line – Remote Error Indicator) Event Interrupt**

	L Event Interrupt Status		**Status:** This RESET-upon-READ bit-field indicates whether or not the "Declaration of REI-L Event" Interrupt has occurred since the last read of this register. The Redundant Receive STS-3 TOH Processor block will generate this interrupt anytime it detects an REI-L event within the incoming STS-3 data-stream. 0 - Indicates that the "Detection of REI-L Event" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of REI-L Event" Interrupt has occurred since the last read of this register.
4	Detection of B2 Byte Error Interrupt Status	RUR	**Detection of B2 Byte Error Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of B2 Byte Error Interrupt" has occurred since the last read of this register. The Redundant Receive STS-3 TOH Processor block will generate this interrupt anytime it detects a B2 byte error within the incoming STS-3 data-stream. 0 – Indicates that the "Detection of B2 Byte Error Interrupt" has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of B2 Byte Error Interrupt" has occurred since the last read of this register.
3	Detection of B1 Byte Error Interrupt Status	RUR	**Detection of B1 Byte Error Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of B1 Byte Error Interrupt" has occurred since the last read of this register. The Redundant Receive STS-3 TOH Processor block will generate this interrupt anytime it detects a B1 byte within the incoming STS-3 data-stream. 0 – Indicates that the "Detection of B1 Byte Error Interrupt" has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of B1 Byte Error Interrupt" has occurred since the last read of this register
2	Change of LOF Defect Condition Interrupt Status	RUR	**Change of Loss of Frame (LOF) Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change of LOF Defect Condition" interrupt has occurred since the last read of this register. The Redundant Receive STS-3 TOH Processor block will generate this interrupt in response to either of the following events. • Whenever the Redundant Receive STS-3 TOH Processor block declares the LOF defect condition. • Whenever the Redundant Receive STS-3 TOH Processor block clears the LOF defect condition. 0 – Indicates that the "Change of LOF Defect Condition" interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change of LOF Defect Condition" interrupt has occurred since the last read of this register. ***Note:*** *The user can determine whether the Redundant Receive STS-3 TOH Processor block is currenly declaring the LOF defect condition by reading out the state of Bit 2 (LOF Defect Declared) within the "Redundant Receive STS-3 Transport Status Register – Byte 0 (Address Location= 0x1707).*
1	Change of SEF Defect Condition Interrupt Status	RUR	**Change of SEF Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change of SEF" Defect Condition Interrupt has occurred since the last read of this

			register. The Redundant Receive STS-3 TOH Processor block will generate this interrupt in response to either of the following events. • Whenever the Redundant Receive STS-3 TOH Processor block declares the SEF defect condition. • Whenever the Redundant Receive STS-3 TOH Processor block clears the SEF defect condition. 0 – Indicates that the "Change of SEF Defect Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change of SEF Defect Condition" Interrupt has occurred since the last read of this register. ***Note:*** *The user can determine whether or not the Redundant Receive STS-3 TOH Processor block is currently declaring the SEF defect condition by reading out the state of Bit 1 (SEF Defect Declared) within the "Redundant Receive STS-3 Transport Status Register – Byte 0 (Address Location= 0x1707).*
0	Change of LOS Defect Condition Interrupt Status	RUR	**Change of Loss of Signal (LOS) Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change of LOS Defect Condition" interrupt has occurred since the last read of this register. The Redundant Receive STS-3 TOH Processor block will generate this interrupt in response to either of the following events. • Whenever the Redundant Receive STS-3 TOH Processor block declares the LOS defect condition. • Whenever the Redundant Receive STS-3 TOH Processor block clears the LOS defect condition. 0 – Indicates that the "Change of LOS Defect Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change of LOS Defect Condition" Interrupt has occurred since the last read of this register. ***Note:*** *The user can determine whether the Redundant Receive STS-3 TOH Processor block is currently declaring the LOS defect condition by reading out the contents of Bit 0 (LOS Defect Declared) within the Redundant Receive STS-3 Transport Status Register – Byte 0 (Address Location= 0x1707).*

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	New S1 Byte Value Interrupt Enable	R/W	**New S1 Byte Value Interrupt Enable:** This READ/WRITE bit-field permits the user to enable or disable the "New S1 Byte Value" Interrupt. If the user enables this interrupt, then the Redundant Receive STS-3 TOH Processor block will generate this interrupt anytime it receives and accepts a new S1 byte value. The Redundant Receive STS-3 TOH Processor block will accept a new S1 byte after it has received it for 8 consecutive STS-3 frames. 0 – Disables the "New S1 Byte Value" Interrupt. 1 – Enables the "New S1 Byte Value" Interrupt.
6	Change in S1 Unstable State Interrupt Enable	R/W	**Change in S1 Byte Unstable Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in S1 Byte Unstable Defect Condition" Interrupt. If the user enables this bit-field, then the Redundant Receive STS-3 TOH Processor block will generate an interrupt in response to either of the following conditions. • Whenever the Redundant Receive STS-3 TOH Processor block declares the "S1 Byte Unstable" defect condition. • Whenever the Redundant Receive STS-3 TOH Processor block clears the "S1 Byte Unstable" defect condition. 0 – Disables the "Change in S1 Byte Unstable Defect Condition" Interrupt. 1 – Enables the "Change in S1 Byte Unstable Defect Condition" Interrupt.
5 - 3	Unused	R/O	
2	Receive TOH CAP DONE Interrupt Enable	R/W	**Receive TOH Capture DONE – Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Receive TOH Data Capture" interrupt, within the Redundant Receive STS-3 TOH Processor Block. If this interrupt is enabled, then the Redundant Receive STS-3 TOH Processor block will generate an interrupt anytime it has captured the last TOH byte into the Capture Buffer. ***Note:*** *Once the TOH (of a given STS-3 frame) has been captured and loaded into the "Receive TOH Capture" buffer, it will remain there for one SONET frame period.* 0 – Disables the "Receive TOH Capture" Interrupt. 1 – Enables the "Receive TOH Capture" Interrupt.

1	Change in K1, K2 Byte Unstable Defect Condition Interrupt Enable	R/W	**Change of K1, K2 Byte Unstable Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change of K1, K2 Byte Unstable defect condition" interrupt. If the user enables this interrupt, then the Redundant Receive STS-3 TOH Processor block will generate an Interrupt in response to either of the following events. • Whenever the Redundant Receive STS-3 TOH Processor block declares the "K1, K2 Byte Unstable defect" condition. • Whenever the Redundant Receive STS-3 TOH Processor block clears the "K1, K2 Byte Unstable defect" condition. 0 – Disables the "Change in K1, K2 Byte Unstable Defect Condition" Interrupt 1 – Enables the "Change in K1, K2 Byte Unstable Defect Condition" Interrupt
0	New K1K2 Byte Interrupt Enable	R/W	**New K1, K2 Byte Value Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "New K1, K2 Byte Value" Interrupt. If the user enables this interrupt, then the Redundant Receive STS-3 TOH Processor block will generate this interrupt anytime it receives and accepts a new K1, K2 byte value. The Redundant Receive STS-3 TOH Processor block will accept a new K1, K2 byte value, after it has received it within 3 (or 5) consecutive STS-3 frames. 0 – Disables the "New K1, K2 Byte Value" Interrupt. 1 – Enables the "New K1, K2 Byte Value" Interrupt.

7	Change of SF Defect Condition Interrupt Enable	R/W	**Change of Signal Failure (SF) Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change of Signal Failure (SF) Defect Condition" Interrupt. If the user enables this interrupt, then the XRT94L33 will generate an interrupt in response to any of the following events. • Whenever the Redundant Receive STS-3 TOH Processor block declares the SF defect condition. • Whenever the Redundant Receive STS-3 TOH Processor block clears the SF defect condition. 0 – Disables the "Change of SF Defect Condition Interrupt". 1 – Enables the "Change of SF Defect Condition Interrupt".
6	Change of SD Defect Condition Interrupt Enable	R/W	**Change of Signal Degrade (SD) Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change of Signal Degrade (SD) Defect Condition" Interrupt. If the user enables this interrupt, then the XRT94L33 will generate an interrupt in response to either of the following events. • Whenever the Redundant Receive STS-3 TOH Processor block declares the SD defect condition. • Whenever the Redundant Receive STS-3 TOH Processor block clears the SD defect condition. 0 – Disables the "Change of SD Defect Condition Interrupt". 1 – Enables the "Change of SD Defect Condition Interrupt".
5	Detection of REI-L Event Interrupt Enable	R/W	**Detection of REI-L (Line – Remote Error Indicator) Event Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of Line – REI-L Event" interrupt. If the user enables this interrupt, then the XRT94L33 will generate an interrupt anytime the Redundant Receive STS-3 TOH Processor block detects an "REI-L" event, within the incoming STS-3 data-stream. 0 – Disables the "Detection of REI-L Event" Interrupt. 1 – Enables the "Detection of REI-L Event" Interrupt.
4	Detection of B2 Byte Error Interrupt Enable	R/W	**Detection of B2 Byte Error Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of B2 Byte Error" Interrupt. If the user enables this interrupt, then the XRT94L33 will generate an interrupt anytime the Redundant Receive

			STS-3 TOH Processor block detects a B2 byte error within the incoming STS-3 data-stream. 0 – Disables the "Detection of B2 Byte Error Interrupt". 1 – Enables the "Detection of B2 Byte Error Interrupt".
3	Detection of B1 Byte Error Interrupt Enable	R/W	**Detection of B1 Byte Error Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of B1 Byte Error" Interrupt. If the user enables this interrupt, then the XRT94L33 will generate an interrupt anytime the Redundant Receive STS-3 TOH Processor block detects a B1 byte error within the incoming STS-3 data-stream. 0 – Disables the "Detection of B1 Byte Error Interrupt". 1 – Enables the "Detection of B1 Byte Error Interrupt".
2	Change of LOF Defect Condition Interrupt Enable	R/W	**Change of Loss of Frame (LOF) Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change of LOF Defect Condition" interrupt. If the user enables this interrupt, then the XRT94L33 will generate an interrupt in response to either of the following conditions. • Whenever the Redundant Receive STS-3 TOH Processor block declares the "LOF" defect condition. • Whenever the Redundant Receive STS-3 TOH Processor clears the "LOF" defect condition. 0 – Disables the "Change of LOF Defect Condition Interrupt. 1 – Enables the "Change of LOF Defect Condition" Interrupt.
1	Change of SEF Defect Condition Interrupt Enable	R/W	**Change of SEF Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change of SEF Defect Condition" Interrupt. If the user enables this interrupt, then the XRT94L33 will generate an interrupt in response to either of the following conditions. • Whenever the Redundant Receive STS-3 TOH Processor block declares the "SEF" defect condition. • Whenever the Redundant Receive STS-3 TOH Processor block clears the "SEF" defect condition. 0 – Disables the "Change of SEF Defect Condition Interrupt". 1 – Enables the "Change of SEF Defect Condition Interrupt".
0	Change of LOS Defect Condition Interrupt Enable	R/W	**Change of Loss of Signal (LOS) Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change of LOF Defect Condition" interrupt. If the user enables this interrupt, then the XRT94L33 will generate an interrupt in response to either of the following conditions. • Whenever the Redundant Receive STS-3 TOH Processor block declares the "LOF" defect condition. • Whenever the Redundant Receive STS-3 TOH Processor block clears the "LOF" defect condition. 0 – Disables the "Change of LOF Defect Condition Interrupt. 1 – Enables the "Change of LOF Defect Condition" Interrupt.

4 – 3	FRPATOUT[1:0]	R/W	**Framing Pattern – SEF Declaration Criteria:** These two READ/WRITE bit-fields permit the user to define the SEF Defect Declaration criteria for the Redundant Receive STS-3 TOH Processor block. The relationship between the state of these bit-fields and the corresponding SEF Defect Declaration Criteria are presented below.
2 - 1	FRPATIN[1:0]	R/W	**Framing Pattern – SEF Defect Clearance Criteria:**

FRPATOUT[1:0]	SEF Defect Declaration Criteria
00 01	The Redundant Receive STS-3 TOH Processor block will declare the SEF defect condition if either of the following conditions are true for four consecutive SONET frame periods. • If the last (of the 3) A1 bytes, in the STS-3 data stream is erred, or • If the first (of the 3) A2 bytes, in the STS-3 data stream, is erred. Hence, for this selection, a total of 16 bits are evaluated for SEF defect declaration.
10	The Redundant Receive STS-3 TOH Processor block will declare the SEF defect condition if either of the following conditions are true for four consecutive SONET frame periods. • If the last two (of the 3) A1 bytes, in the STS-3 data stream, are erred, or • If the first two (of the 3) A2 bytes, in the STS-3 data stream, are erred. Hence, for this selection, a total of 32 bits are evaluated for SEF defect declaration.
11	The Redundant Receive STS-3 TOH Processor block will declare the SEF defect condition if either of the following conditions are true for four consecutive SONET frame periods. • If the last three (of the 3) A1 bytes, in the STS-3 data stream, are erred, or • If the first three (of the 3) A2 bytes, in the STS-3 data stream, are erred. Hence, for this selection, a total of 48 bits are evaluated for SEF defect declaration.

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Unused	R/O	
6	STS-N Overhead Insert	R/W	**STS-N Overhead Insert:** This READ/WRITE bit-field permits the user to configure the TxTOH input port to insert the TOH for all lower-tributary STS-1s within the outbound STS-3 signal. 0 – Disables this feature. In this mode, the TxTOH input port will only accept the TOH for the first STS-1 within the outbound STS-3 signal. 1 – Enables this feature.
5	E2 Byte Insert Method	R/W	**E2 Byte Insert Method:** This READ/WRITE bit-field permits the user to configure the Transmit STS-3 TOH Processor block to use either the contents within the "Transmit STS-3 Transport – E2 Byte Value" Register or the TxTOH input port as the source for the E2 byte, within the outbound STS-3 data-stream, as described below. 0 – Configures the Transmit STS-3 TOH Processor block to accept externally supplied data (via the "TxTOH serial input port) and to insert this data into the E2 byte position within each outbound STS-3 frame. 1 – Configures the Transmit STS-3 TOH Processor block to insert the contents within the "Transmit STS-3 Transport – E2 Byte Value" register (Address Location = 0x1947) into the E2 byte-position, within each outbound STS-3 frame. This configuration selection permits the user to have software control over the value of the E2 byte within the "Transmit Output" STS-3 data-stream.
4	E1 Byte Insert Method	R/W	**E1 Byte Insert Method:** This READ/WRITE bit-field permits the user to configure the Transmit STS-3 TOH Processor block to use either the contents within the "Transmit STS-3 Transport – E1 Byte Value" Register or the TxTOH Input port as the source for the E1 byte, within the outbound STS-3 data-stream, as described below. 0 – Configures the Transmit STS-3 TOH Processor block to accept externally supplied data (via the "TxTOH serial input port) and to insert this data into the E1 byte position within each outbound STS-3 frame. 1 – Configures the Transmit STS-3 TOH Processor block to insert the contents within the "Transmit STS-3 Transport – E1 Byte Value" register (Address Location = 0x1943) into the E1 byte-position, within each outbound STS-3 frame. This configuration selection permits the user to have software control over the value of the E1 byte within the "Transmit Output" STS-3 data-stream.

3	F1 Byte Insert Method	R/W	**F1 Byte Insert Method:** This READ/WRITE bit-field permits the user to configure the Transmit STS-3 TOH Processor block to use either the contents within the "Transmit STS-3 Transport – F1 Byte Value" Register or the TxTOH Input port as the source for the F1 byte, within the outbound STS-3 data-stream, as described below. 0 – Configures the Transmit STS-3 TOH Processor block to accept externally supplied data (via the "TxTOH" serial input port) and to insert this data into the F1 Byte position within each outbound STS-3 frame. 1 – Configures the Transmit STS-3 TOH Processor block to insert the contents within the "Transmit STS-3 Transport – F1 Byte Value" register (Address Location = 0x193F) into the F1 byte-position, within each outbound STS-3 frame. This configuration selection permits the user to have software control over the value of the F1 byte within the "Transmit Output" STS-3 data-stream.
2	S1 Byte Insert Method	R/W	**S1 Byte Insert Method:** This READ/WRITE bit-field permits the user to configure the Transmit STS-3 TOH Processor block to use either the contents within the "Transmit STS-3 Transport – S1 Byte Value" Register or the TxTOH Input port as the source for the E1 byte, within the outbound STS-3 data-stream, as described below. 0 – Configures the Transmit STS-3 TOH Processor block to accept externally supplied data (via the "TxTOH" serial input port) and to insert this data into the S1 Byte position within each outbound STS-3 frame. 1 – Configures the Transmit STS-3 TOH Processor block to insert the contents within the "Transmit STS-3 Transport – S1 Byte Value" register (Address Location = 0x193B). This configuration selection permits the user to have software control over the value of the S1 byte within the "Transmit Output" STS-3 data-stream.
1	K1K2 Byte Insert Method	R/W	**K1K2 Byte Insert Method:** This READ/WRITE bit-field permits the user to configure the Transmit STS-3 TOH Processor block to use either the contents within the "Transmit STS-3 Transport – K1 Byte Value" and "Transmit STS-3 Transport – K2 Byte Value" registers or the "TxTOH Input port as the source for the K1 and K2 bytes, within the outbound STS-3 data-stream, as described below. 0 – Configures the Transmit STS-3 TOH Processor block to accept externally supplied data (via the "TxTOH" serial input port) and to insert this data into the K1 and K2 Byte positions within each outbound STS-3 frame. 1 – Configures the Transmit STS-3 TOH Processor block to insert the contents within the "Transmit STS-3 Transport – K1 Byte Value" Register (Address Location = 0x192E) and the "Transmit STS-3 Transport – K2 Byte Value" register (Address Location = 0x192F) into the K1 and K2 byte-positions, within each outbound STS-3 frame. This configuration selection permits the user to have software control over the value of the K1 and K2 bytes within the "Transmit Output" STS-3 data-stream.
0	M1 Byte Insert Method[1]	R/W	**M1 Byte Insert Method – Bit 1:** This READ/WRITE bit-field, along with the "M1 Insert Method[0]" bit-field (located in the "Transmit STS-3 Transport – SONET Control Register – Byte 0") permits the user to specify the source of the contents of the M1 byte, within the "transmit" output STS-3 data stream. The relationship between these two bit-fields and the corresponding source of the M1 byte (within each outbound STS-3 frame) is presented

below.

M1 Byte Insert Method[1:0]		Source of M1 Byte
0	0	Functions as the REI-L indicator (based upon the number of B2 byte errors that have been detected by the Receive STS-3 TOH Processor block)
0	1	The M1 byte value is obtained from the contents of the "Transmit STS-3 Transport – M1 Byte Value" register (Address Location = 0x1937). **NOTE:** This configuration selection permits the user to exercise software control over the contents within the M1 byte, of each outbound STS-3 frame.
1	0	The M1 byte value is obtained from the "TxTOH" Serial Input Port.
1	1	Functions as the REI-L bit-field (based upon the number of B2 byte errors that have been detected by the Receive STS-3 TOH Processor block).

<table>
<tr><th>BIT NUMBER</th><th>NAME</th><th>TYPE</th><th>DESCRIPTION</th></tr>
<tr><td>7</td><td>M1 Byte Insert Method[0]</td><td>R/W</td><td>M1 Byte Insert Method – Bit 0:

This READ/WRITE bit-field, along with the “M1 Insert Method[1]” bit-field (located in the “Transmit STS-3 Transport – SONET Control Register – Byte 1”) permits the user to specify the source of the contents of the M1 byte, within the “transmit” output STS-3 data stream.

The relationship between these two bit-fields and the corresponding source of the M1 byte (within each outbound STS-3 frame) is presented below.

<table>
<tr><th colspan="2">M1 Insert Method[1:0]</th><th>Source of M1 Byte</th></tr>
<tr><td>0</td><td>0</td><td>Functions as the REI-L indicator (based upon the number of B2 byte errors that have been detected by the Receive STS-3 TOH Processor block)</td></tr>
<tr><td>0</td><td>1</td><td>The M1 byte value is obtained from the contents of the “Transmit STS-3 Transport – M1 Byte Value” register (Address Location= 0x1937).

NOTE: This configuration selection permits the user to exercise software control over the contents within the M1 byte of each outbound STS-3 frame.</td></tr>
<tr><td>1</td><td>0</td><td>The M1 byte value is obtained from the “TxTOH” Serial Input Port.</td></tr>
<tr><td>1</td><td>1</td><td>Functions as the REI-L bit-field (based upon the number of B2 byte errors that have been detected by the Receive STS-3 TOH Processor block.</td></tr>
</table>
</td></tr>
<tr><td>6</td><td>Unused</td><td>R/O</td><td></td></tr>
<tr><td>5</td><td>Force Transmission of RDI-L</td><td>R/W</td><td>Force Transmission of RDI-L (Line - Remote Defect Indicator):

This READ/WRITE bit-field permits the user to (by software control) force the Transmit STS-3 TOH Processor block to generate and transmit the RDI-L indicator to the remote terminal equipment as described below.

0 – Does not configure the Transmit STS-3 TOH Processor block to generate and transmit the RDI-L indicator. In this setting, the Transmit STS-3 TOH Processor block will only generate and transmit the RDI-L indicator whenever the Receive STS-3 TOH Processor block is</td></tr>
</table>

			declaring a defect condition. 1 – Configures the Transmit STS-3 TOH Processor block to generate and transmit the RDI-L indicator to the remote terminal equipment. In this case, the STS-3 Transmitter will force bits 6, 7 and 8 (of the K2 byte) to the value "1, 1, 0". ***Note:*** *This bit-field is ignored if the Transmit STS-3 TOH Processor block is transmitting the Line AIS (AIS-L) indicator or the LOS pattern.*
4	Force Transmission of AIS-L	R/W	**Force Transmission of AIS-L (Line AIS) Indicator:** This READ/WRITE bit-field permits the user to (by software control) force the Transmit STS-3 TOH Processor block to generate and transmit the AIS-L indicator to the remote terminal equipment, as described below. 0 – Does not configure the Transmit STS-3 TOH Processor block to generate and transmit the AIS-L indicator. In this case, the Transmit STS-3 TOH Processor block will continue to transmit normal traffic to the remote terminal equipment. 1 – Configures the Transmit STS-3 TOH Processor block to generate and transmit the AIS-L indicator to the remote terminal equipment. In this case, the Transmit STS-3 TOH Processor block will force all bits (within the "outbound" STS-3 frame) with the exception of the Section Overhead Bytes to an "All Ones" pattern. ***Note:*** *This bit-field is ignored if the Transmit STS-3 TOH Processor block is transmitting the LOS pattern.*
3	Force Transmission of LOS Pattern	R/W	**Force Transmission of LOS Pattern:** This READ/WRITE bit-field permits the user to (by software control) force the Transmit STS-3 TOH Processor block to transmit the LOS (Loss of Signal) pattern to the remote terminal equipment, as described below. 0 – Does not configure the Transmit STS-3 TOH Processor block to generate and transmit the LOS pattern. In this case, the Transmit STS-3 TOH Processor block will continue to transmit "normal" traffic to the remote terminal equipment. 1 – Configures the Transmit STS-3 TOH Processor block to transmit the LOS pattern to the remote terminal equipment. In this case, the Transmit STS-3 TOH Processor block will force all bytes (within the "outbound" SONET frame) to an "All Zeros" pattern.
2	Scrambler Enable	R/W	**Scrambler Enable:** This READ/WRITE bit-field permits the user to either enable or disable the Scrambler, within the Transmit STS-3 TOH Processor block circuitry 0 – Disables the Scrambler. 1 – Enables the Scrambler.
1	B2 Byte Error Insert	R/W	**Transmit B2 Byte Error Insert Enable:** This READ/WRITE bit-field permits the user to configure the Transmit STS-3 TOH Processor block to insert errors into the "outbound" B2 bytes, per the contents within the "Transmit STS-3 Transport – Transmit B2 Byte Error Mask Registers" as described below. 0 – Configures the Transmit STS-3 TOH Processor block to NOT insert errors into the B2 bytes, within the outbound STS-3 signal. 1 – Configures the Transmit STS-3 TOH Processor block to insert errors into the B2 bytes (per the contents within the "Transmit B2 Byte

			Error Mask Registers").
0	A1A2 Byte Error Insert	R/W	**Transmit A1A2 Byte Error Insert Enable:** This READ/WRITE bit-field permits the user to configure the Transmit STS-3 TOH Processor block to insert errors into the "outbound" A1 and A2 bytes, per the contents within the "Transmit STS-3 Transport – Transmit A1 Byte Error Mask" and Transmit A2 Byte Error Mask" Registers. 0 – Configures the Transmit STS-3 TOH Processor block to NOT insert errors into the A1 and A2 bytes, within the outbound STS-3 data-stream. 1 – Configures the Transmit STS-3 TOH Processor block to insert errors into the A1 and A2 bytes (per the contents within the "Transmit A1 Byte Error Mask" and "Transmit A2 Byte Error Mask" Registers.

2	A1 Byte Error in STS-1 # 2	R/W	**A1 Byte Error in STS-1 # 2, within outbound STS-3 signal:** This READ/WRITE bit-field permits the user to configure the Transmit STS-3 TOH Processor block to transmit an erred A1 byte, within STS-1 # 2 within the outbound STS-3 signal, as described below. 0 – Configures the Transmit STS-3 TOH Processor block to NOT transmit an erred A1 byte, within STS-1 Channel 2. 1 – Configures the Transmit STS-3 TOH Processor block to transmit an erred A1 byte, within STS-1 Channel 2. In this configuration setting, the state of each bit (within this particular A1 byte) will be inverted. Hence all 8-bits within this particular A1 byte will be erred. ***Note:*** *This bit-field is only valid if Bit 0 (A1A2 Byte Error Insert), within the "Transmit STS-3 Transport – SONET Transmit Control Register – Byte 0 (Address Location= 0x1903) to "1".*
1	A1 Byte Error in STS-1 # 1	R/W	**A1 Byte Error in STS-1 # 1, within outbound STS-3 signal:** This READ/WRITE bit-field permits the user to configure the Transmit STS-3 TOH Processor block to transmit an erred A1 byte, within STS-1 # 1 within the outbound STS-3 signal, as described below. 0 – Configures the Transmit STS-3 TOH Processor block to NOT transmit an erred A1 byte, within STS-1 Channel 1. 1 – Configures the Transmit STS-3 TOH Processor block to transmit an erred A1 byte, within STS-1 Channel 1. In this configuration setting, the state of each bit (within this particular A1 byte) will be inverted. Hence all 8-bits within this particular A1 byte will be erred. ***Note:*** *This bit-field is only valid if Bit 0 (A1A2 Byte Error Insert), within the "Transmit STS-3 Transport – SONET Transmit Control Register – Byte 0 (Address Location= 0x1903) to "1".*
0	A1 Byte Error in STS-1 # 0	R/W	**A1 Byte Error in STS-1 # 0, within outbound STS-3 signal:** This READ/WRITE bit-field permits the user to configure the Transmit STS-3 TOH Processor block to transmit an erred A1 byte, within STS-1 # 0 within the outbound STS-3 signal, as described below. 0 – Configures the Transmit STS-3 TOH Processor block to NOT transmit an erred A1 byte, within STS-1 Channel 0. 1 – Configures the Transmit STS-3 TOH Processor block to transmit an erred A1 byte, within STS-1 Channel 0. In this configuration setting, the state of each bit (within this particular A1 byte) will be inverted. Hence, all 8-bits within this particular A1 byte will be erred. ***Note:*** *This bit-field is only valid if Bit 0 (A1A2 Byte Error Insert), within the "Transmit STS-3 Transport – SONET Transmit Control Register – Byte 0 (Address Location= 0x1903) to "1".*

0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 0	Transmit_K1_Byte_Value[7:0]	R/W	**Transmit K1 Byte Value:** If the user has configured the Transmit STS-3 TOH Processor block to use the contents of the "Transmit K1 Byte Value" Register as the source for the K1 byte value (within the outbound STS-3 data-stream), then these READ/WRITE bit-fields will permit the user to specify the contents of the K1 byte, within the "outbound" STS-3 signal. If Bit 1 (K1K2 Byte Insert Method) within the Transmit STS-3 Transport – SONET Transmit Control Register – Byte 1 (Address Location= 0x1902) is set to "1", then the Transmit STS-3 TOH Processor block will load the contents of this register into the "K1" byte-field, within each outbound STS-3 frame. ***Note:*** *These register bits are ignored if Bit 1 (K1K2 Insert Method) is set to "0".*

R/O	R/O	R/O	R/O	R/W	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 4	Unused	R/O	
3	External RDI-L Enable	R/W	**External RDI-L Insertion Enable:** This READ/WRITE bit-field permits the user to configure the Transmit STS-3 TOH Processor to accept data via the "TxTOH" input pin, when transmitting the RDI-L indicator to the remote terminal equipment. 0 – Configures the Transmit STS-3 TOH Processor block to internally generate the RDI-L indicator based upon defect conditions that are being declared by the Receive STS-3 TOH Processor block. 1 – Configure the Transmit STS-3 TOH Processor block accept external data via the "TxTOH" input port and to load this value into Bits 6, 7 and 8 (within the K2 byte) within each outbound STS-3 data-stream.
2	Transmit RDI-L upon AIS-L	R/W	**Transmit Line Remote Defect Indicator (RDI-L) upon Declaration of the AIS-L defect condition:** This READ/WRITE bit-field permits the user to configure the Transmit STS-3 TOH Processor block to automatically transmit the RDI-L indicator to the remote LTE anytime (and for the duration) that the Receive STS-3 TOH Processor is declaring the Line AIS (AIS-L) defect condition as described below. 0 – Configures the Transmit STS-3 TOH Processor block to NOT automatically transmit the RDI-L indicator, whenever (and for the duration that) the Receive STS-3 TOH Processor block is declares the AIS-L defect condition. 1 – Configures the Transmit STS-3 TOH Processor block to automatically transmit the RDI-L indicator, whenever (and for the duration that) the Receive STS-3 TOH Processor block declares the AIS-L defect condition.
1	Transmit RDI-L upon LOF	R/W	**Transmit Line Remote Defect Indicator (RDI-L) upon Declaration of the LOF defect condition:** This READ/WRITE bit-field permits the user to configure the Transmit STS-3 TOH Processor block to automatically transmit the RDI-L indicator to the remote LTE anytime (and for the duration) that the Receive STS-3 TOH Processor block is declaring the LOF defect condition as described below. 0 – Configures the Transmit STS-3 TOH Processor to NOT automatically transmit the RDI-L indicator, whenever the Receive STS-3 TOH Processor block declares the LOF defect condition. 1 – Configures the Transmit STS-3 TOH Processor block to automatically transmit the RDI-L indicator, whenever (and for the duration that) the Receive STS-3 TOH Processor block declares

			the LOF defect condition.
0	Transmit RDI-L upon LOS	R/W	**Transmit Line Remote Defect Indicator (RDI-L) upon Declaration of the LOS defect condition:** This READ/WRITE bit-field permits the user to configure the Transmit STS-3 TOH Processor block to automatically transmit the RDI-L indicator to the remote LTE anytime (and for the duration) that the Receive STS-3 TOH Processor block declares the LOS defect condition. 0 – Configures the Transmit STS-3 TOH Processor block to NOT automatically transmit the RDI-L indicator, whenever the Receive STS-3 TOH Processor block declares the LOS defect condition. 1 – Configures the Transmit STS-3 TOH Processor block to automatically transmit the RDI-L indicator, whenever (and for the duration that) the Receive STS-3 TOH Processor block declares the LOS defect condition.

Table 222: Transmit STS-3 Transport – M1 Byte Value Register (Address Location= 0x1937)

Enable All STS-1s	Unused						
R/W	R/O	R/O	R/O	R/O	R/O	R/O	R/O
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Enable All STS-1s	R/W	**Enable All STS-1s:** This READ/WRITE bit-field permits the user to implement either of the following configurations options for software control of the E2 byte value, within the outbound STS-3 signal. 0 – Configures the Transmit STS-3 TOH Processor block to read out the contents of the "Transmit STS-3 Transport – E2 Byte Value" register and load that value into the E2 byte (within STS-1 # 1) within the outbound STS-3 signal. 1 – Configures the Transmit STS-3 TOH Processor block to read out the contents of the 3 "shadow" registers, and to load these values into the E2 byte positions, within each corresponding STS-1 signal; within the outbound STS-3 signal. ***Note:*** *This register bit is ignored if Bit 5 (E2 Byte Insert Method) within the "Transmit STS-3 Transport – SONET Transmit Control Register – Byte 1" (Address Location= 0x1902) is set to "0".*
6 - 0	Unused	R/O	

Table 227: Transmit STS-3 Transport – E2 Pointer Register (Address Location= 0x1946)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused						E2_Pointer[1:0]	
R/O	R/O	R/O	R/O	R/W	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 2	Unused	R/O	
1 - 0	E2_Pointer[1:0]	R/W	**E2 Pointer[3:0]:** These READ/WRITE bit-fields permit the user to uniquely identify one of the 3 STS-1 E2 byte "shadow" registers, when performing read or write operations to these registers. If the user has set Bit 7 (Enable All STS-1s), within this register to "1", then the contents of these four register bits, act as a pointer to a given "shadow" register. Once the user specifies this pointer value; then he/she completes the read or write operation (to or from the "shadow" register) by performing a read or write to the "Transmit STS-3 Transport – E2 Byte Value" register (Address Location= 0x1947). Valid "shadow" pointer values range from "0x00" to "0x02" (where the pointer value of "0x00" corresponds to the E2 "shadow" register, corresponding to STS-1 # 1; and so on). ***Note:*** *This register bit is ignored if Bit 7 (Enable All STS-1s) is set to "1"; or if Bit 5 (E2 Byte Insert Method) within the "Transmit STS-3 Transport – SONET Transmit Control Register – Byte 1" (Address Location= 0x1902) is set to "0".*

Table 228: Transmit STS-3 Transport – E2 Byte Value Register (Address Location=0x1947)

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 0	Transmit_E2_Byte_Value[7:0]	R/W	**Transmit E2 Byte Value:** The exact function of these register bits depends upon whether Bit 7 (Enable All STS-1s) within the "Transmit STS-3 Transport – E2 Byte Control" Register (Address Location= 0x1944) has been set to "0" or "1"; as described below. **If "Enable All STS-1s" is set to "0"** If the appropriate "E2 Insert Method" is selected, then these READ/WRITE bit-fields will permit the user to specify the contents of the E2 byte, within the "outbound" STS-3 signal. More specifically, this value will be loaded into the E2 byte position, within STS-1 # 1 (within the outbound STS-3 signal). If Bit 5 (E2 Insert Method) within the Transmit STS-3 Transport – SONET Transmit Control Register – Byte 1 (Address Location= 0x1902) is set to "1", then the Transmit STS-3 TOH Processor block will load the contents of this register into the "E2" byte-field, within each outbound STS-3 frame. **If "Enable All STS-1s" is set to "1"** In this mode, these register bit permit the user to have direct READ/WRITE access of the "STS-1 E2 Byte shadow" register; that is being pointed at by the "E2 Pointer[1:0]" value. These register bits are ignored if Bit 5 (E2 Byte Insert Method) is set to "0".

Table 229: Transmit STS-3 Transport – J0 Byte Value Register (Address Location= 0x194B)

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 4	Unused	R/O	
3 – 2	Transmit Section Trace Message Length[1:0]	R/W	**Transmit Section Trace Message Length[1:0]:** These two READ/WRITE bit-fields permit the user to specify the length of the Section Trace message that the Transmit STS-3 TOH Processor block will repeatedly transmit to the remote LTE. The relationship between the contents of these bit-fields and the corresponding Transmit Section Trace Message Length is presented below.
1 – 0	Transmit Section Trace Message Source[1:0]	R/W	**Transmit Section Trace Message Source[1:0]:** These two READ/WRITE bit-fields permit the user to specify the source of the "outbound" Section Trace message that will be transported via the J0 byte channel within the outbound STS-3 data-stream, as depicted below.

Transmit Section Trace Message Length[1:0]	Resulting Section Trace Message Length (in terms of bytes)
00	1 Byte
01	16 Bytes
10 or 11	64 Bytes

Transmit Section Trace Message Source[1:0]	Resulting Source of the Section Trace Message.
00	**Fixed Value:** The Transmit STS-3 TOH Processor block will automatically set the J0 Byte, in each "outbound" STS-3 frame to the value "0x01".
01	**The "Transmit Section Trace Message Buffer".** The Transmit STS-3 TOH Processor block will read out the contents within the Transmit Section Trace Message Buffer, and will transmit this message to the remote LTE. The "Transmit STS-3 TOH Processor block - Transmit Section Trace Message Buffer" Memory is located at Address Location 0x1B00 through 0x1B3F.
10	**From the "Transmit J0 Value[7:0]" Register.**

			11 — **From the "TxTOH" Input pin (pin F8).** In this configuration setting, the Transmit STS-3 TOH Processor block will externally accept the contents of the "Section Trace Message" via the "TxTOH Input Port" and it will transport this message (via the J0 byte-channel) to the remote LTE.

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 4	Unused	R/O	
3 - 0	TxTOH_CLOCK_SPEED[7:0]	R/W	**TxTOHClk Output Clock Signal Speed:** These READ/WRITE bit-fields permits the user to specify the frequency of the "TxTOHClk output clock signal. The formula that relates the contents of these register bits to the "TxTOHClk" frequency is presented below. FREQ = 19.44 /[2 * (TxTOH_CLOCK_SPEED + 1) ***Note:*** *For STS-3/STM-1 applications, the frequency of the TxTOHClk output signal must be in the range of 0.6075MHz to 9.72MHz*

1.8 TRANSMIT STS-3C POH PROCESSOR BLOCK REGISTERS

The register map for the Transmit STS-3c POH Processor Block is presented in the Table below. Additionally, a detailed description of each of the "Transmit STS-3c POH Processor" block registers is presented below.

In order to provide some orientation for the reader, an illustration of the Functional Block Diagram for the XRT94L33, with the "Transmit STS-3c POH Processor Block "highlighted" is presented below in Figure 5.

Figure 5: Illustration of the Functional Block Diagram of the XRT94L33, with the Transmit STS-3c POH Processor Block "High-lighted".

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	F2 Byte Insertion Type	R/W	**F2 Byte Insertion Type:** This READ/WRITE bit-field permits the user to configure the Transmit STS-3c POH Processor block to use either the contents within the "Transmit STS-3c Path – Transmit F2 Byte Value" Register or the TxPOH input pin as the source for the F2 byte, in the outbound STS-3c SPE data-stream, as described below. 0 – Configures the Transmit STS-3c POH Processor block to insert the contents within the "Transmit STS-3c Path – Transmit F2 Byte Value" Register into the F2 byte position within each outbound STS-3c SPE. 1 – Configures the Transmit STS-3c POH Processor block to accept externally supplied data (via the "TPOH" input port) and to insert this data into the F2 byte position within each outbound STS-3c SPE. ***Note:*** *The Address Location of the Transmit STS-3c POH Processor block - Transmit F2 Byte Value Register is 0x19A3*
6 - 5	REI-P Insertion Type[1:0]	R/W	**REI-P Insertion Type[1:0]:** These two READ/WRITE bit-fields permit the user to configure the Transmit STS-3c POH Processor block to use one of the three following sources for the REI-P bit-fields (e.g., bits 1 through 4, within the G1 byte) within each outbound STS-3c SPE. • From the Receive STS-3c POH Processor block (e.g., the Transmit STS-3c POH Processor block will set the REI-P bit-fields to the appropriate value, based upon the number of B3 byte errors that the Receive STS-3c POH Processor block detects and flags, within its incoming STS-3c SPE data-stream). • From the "Transmit G1 Byte Value" Register. In this case, the Transmit STS-3c POH Processor block will insert the contents of Bits 7 through 4 within the "Transmit STS-3c POH Processor block – Transmit G1 Byte Value" Register into the REI-P bit-fields within each outbound STS-3c SPE. • From the "TPOH" input pin. In this case, the Transmit STS-3c POH Processor block will accept externally supplied data (via the "TPOH" input port) and it will insert this data into the REI-P bit-fields within each outbound STS-3c SPE. 00/11 – Configures the Transmit STS-3c POH Processor block to set Bits 1 through 4 (in the G1 byte of the outbound SPE) based upon the number of B3 byte errors that the Receive STS-3c POH Processor block detects and flags within the incoming STS-3c data-stream. 01 – Configures the Transmit STS-3c POH Processor block to set Bits 1 through 4 (in the G1 byte of the outbound SPE) based upon the contents within the "Transmit STS-3c POH Processor block - Transmit G1 Byte Value" register. 10 – Configures the Transmit STS-3c POH Processor block to accept externally supplied data (via the TPOH input port) and to insert this data into the REI-P bit-positions within each outbound STS-3c SPE. ***Note:*** *The address location of the Transmit STS-3c POH Processor block -*

			Transmit G1 Byte Value Register is 0x199F
4 - 3	RDI-P Insertion Type[1:0]	R/W	**RDI-P Insertion Type[1:0]:** These two READ/WRITE bit-fields permit the user to configure the Transmit STS-3c POH Processor block to use one of the three following sources for the RDI-P bit-fields (e.g., bits 5 through 7, within the G1 byte) within each outbound STS-3c SPE. • From the corresponding Receive STS-3c POH Processor block (e g., the Transmit STS-3c POH Processor block will set the RDI-P bit-fields to the appropriate value, based upon which defect conditions are being declared by the Receive STS-3c POH Processor block, within its incoming STS-3c SPE data-stream). • From the "Transmit G1 Byte Value" Register. In this case, the Transmit STS-3c POH Processor blolck will insert the content of bits 2 through 0 within the "Transmit STS-3c POH Processor block – Transmit G1 Byte Value" Register into the RDI-P bit-fields within each outbound STS-3c SPE. • From the "TPOH" input pin. In this case, the Transmit STS-3c POH Processor block will accept externally supplied data (via the "TPOH" input port) and it will insert this data into the RDI-P bit-fields within each outbound STS-3c SPE. 00/11 – Configures the Transmit STS-3c POH Processor block to set Bits 5 through 7 (in the G1 byte of the outbound SPE) based upon the defects conditions that the Receive STS-3c POH Processor block is currently declaring within the incoming STS-3c data-stream. 01 – Configures the Transmit STS-3c POH Processor block to set Bits 5 through 7 (in the G1 byte of the outbound SPE) based upon the contents within the "Transmit STS-3c POH Processor block - Transmit G1 Byte Value" register. 10 – Configures the Transmit STS-3c POH Processor block to accept externally supplied data (via the TPOH input port) and to insert this data into the RDI-P bit-positions within each outbound STS-3c SPE. ***Note:*** *The address location of the Transmit STS-3c POH Processor block - Transmit G1 Byte Value Register is 0x199F*
2	C2 Byte Insertion Type	R/W	**C2 Byte Insertion Type:** This READ/WRITE bit-field permits the user to configure the Transmit STS-3c POH Processor block to use either the contents within the "Transmit STS-3c Path – Transmit C2 Byte Value" Register or the TPOH input pin as the source for the C2 byte, in the outbound STS-3c SPE data-stream, as described below. 0 – Configures the Transmit STS-3c POH Processor block to insert the contents within the "Transmit STS-3c Path – Transmit C2 Byte Value" Register into the C2 byte-position within each outbound STS-3c SPE. 1 – Configures the Transmit STS-3c POH Processor block to accept externally supplied data (via the "TPOH" input port) and to insert this data into the C2 byte position within each outbound STS-3c SPE. ***Note:*** *The address location of the Transmit STS-3c POH Processor block - Transmit C2 Byte Value Register is 0x199B*
1	Unused	R/O	
0	Force Transmission of AIS-P	R/W	**Force Transmission of AIS-P:** This READ/WRITE bit-field permits the user to configure the Transmit STS-3c POH Processor block to (via software control) transmit the AIS-P indicator to the remote PTE. If this feature is enabled, then the Transmit STS-3c POH Processor block will automatically set the H1, H2, H3 and all the "outbound" STS-3c SPE bytes to an "All Ones" pattern, prior to routing this data to the Transmit STS-3 TOH

			Processor block. 0 – Configures the Transmit STS-3c POH Processor block to NOT transmit the AIS-P indicator to the remote PTE. In this case, the Transmit STS-3c POH Processor block will transmit "normal" traffic to the remote PTE. 1 – Configures the Transmit STS-3c POH Processor block to transmit the AIS-P indicator to the remote PTE.

Table 235: Transmit STS-3c Path – Transmitter J1 Byte Value Register (Address Location= 0x1993)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Transmit_J1_Byte[7:0]							
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 0	Transmit J1 Byte Value[7:0]	R/W	**Transmit J1 Byte Value:** These READ/WRITE bit-fields permit the user to have software control over the value of the J1 byte, within each outbound STS-3c SPE. If the user configures the Transmit STS-3c POH Processor block to this register as the source of the J1 byte, then it will automatically write the contents of this register into the J1 byte location, within each "outbound" STS-3c SPE. This feature is enabled whenever the user writes the value "[1, 0]" into Bits 1 and 0 (Transmit Path Trace Message Source[1:0]) within the "Transmit STS-3c Path – SONET Path Trace Message Control Register" register. ***Note:*** *The Address Location of the Transmit STS-3c Path – SONET J1 Byte Control Register is 0x19BB*

Table 236: Transmit STS-3c Path – Transmitter B3 Byte Error Mask Register (Address Location= 0x1997)

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 0	Transmit B3 Byte Error_Mask[7:0]	R/W	**Transmit B3 Byte Error Mask[7:0]:** This READ/WRITE bit-field permits the user to insert errors into the B3 byte within each "outbound" STS-3c SPE, prior to transmission to the Transmit STS-3 TOH Processor block. The Transmit STS-3c POH Processor block will perform an XOR operation with the contents of this register, and its "locally-computed" B3 byte value. The results of this operation will be written back into the B3 byte-position within each "outbound" STS-3c SPE. If the user sets a particular bit-field, within this register, to "1", then that corresponding bit, within the "outbound" B3 byte will be in error. ***Note:*** *For normal operation, the user should set this register to 0x00.*

Table 237: Transmit STS-3c Path – Transmit C2 Byte Value Register (Address Location= 0x199B)

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 0	Transmit Z5 Byte Value[7:0]	R/W	**Transmit Z5 Byte Value:** These READ/WRITE bit-fields permit the user to have software control over the value of the Z5 byte, within each outbound STS-3c SPE. If the user configures the Transmit STS-3c POH Processor block to this register as the source of the Z5 byte, then it will automatically write the contents of this register into the Z5 byte location, within each "outbound" STS-3c SPE. This feature is enabled whenever the user writes a "0" into Bit 3 (Z5 Insertion Type) within the "Transmit STS-3c Path – SONET Control Register – Byte 0" register. ***Note:*** *The Address Location of the Transmit STS-3c Path – SONET Control Register – Byte 0" register is 0x1982*

Table 244: Transmit STS-3c Path – Transmit Path Control Register (Address Location= 0x19B7)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused		Pointer Force	Check Stuff	Insert Negative Stuff	Insert Positive Stuff	Insert Continuous NDF Events	Insert Single NDF Event
R/O	R/O	R/W	R/W	W	W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 6	Unused	R/O	
5	Pointer Force	R/W	**Pointer Force:** This READ/WRITE bit-field permits the user to load the values contained within the "Transmit STS-3c POH Arbitrary H1 Pointer Byte" and "Transmit STS-3c POH Arbitrary H2 Pointer Byte" registers into the H1 and H2 bytes (within the outbound STS-3c data stream). ***Note:*** *The actual location of the SPE will NOT be adjusted, per the value of H1 and H2 bytes. Hence, this feature should cause the remote terminal to declare an "Invalid Pointer" condition.* 0 – Configures the Transmit STS-3c POH and Transmit STS-3 TOH Processor blocks to transmit STS-3c/STS-3 data with normal and correct H1 and H2 bytes. 1 – Configures the Transmit STS-3c POH and Transmit STS-3 TOH Processor blocks to overwrite the values of the H1 and H2 bytes (in the outbound STS-3c/STS-3 data-stream) with the values in the "Transmit STS-3c POH Arbitrary H1 and H2 Pointer Byte" registers. ***Note:*** *1. The Address Location of the Transmit STS-3c Arbitrary H1 Pointer Byte register is 0x19BF* *2. The Address Location of the Transmit STS-3c Arbitrary H2 Pointer Byte register is 0x19C3*
4	Check Stuff	R/W	**Check Stuff Monitoring:** This READ/WRITE bit-field permits the user to configure the Transmit STS-3c POH and Transmit STS-3 TOH Processor blocks to only execute a "Positive", "Negative" or "NDF" event (via the "Insert Positive Stuff", "Insert Negative Stuff", "Insert Continuous or Single NDF" options, via software command) if no pointer adjustment (NDF or otherwise) has occurred during the last 3 SONET frame periods. 0 – Disables this feature. In this mode, the Transmit STS-3c POH and Transmit STS-3 TOH Processor blocks will execute a "software-commanded" pointer adjustment event, independent of whether a pointer adjustment event has occurred in the last 3 SONET frame periods. 1 – Enables this feature. In this mode, the Transmit STS-3c POH and Transmit STS-3 TOH Processor blocks will ONLY execute a "software-commanded" pointer adjustment event, if no pointer adjustment event has occurred during the last 3 SONET frame periods.
3	Insert Negative Stuff	R/W	**Insert Negative Stuff:** This READ/WRITE bit-field permits the user to configure the Transmit STS-3c

			POH and Transmit STS-3 TOH Processor blocks to insert a negative-stuff into the outbound STS-3c/STS-3 data stream. This command, in-turn will cause a "Pointer Decrementing" event at the remote terminal. Writing a "0" to "1" transition into this bit-field causes the following to happen. • A negative-stuff will occur (e.g., a single payload byte will be inserted into the H3 byte position within the outbound STS-1/STS-3 data stream). • The "D" bits, within the H1 and H2 bytes will be inverted (to denote a "Decrementing" Pointer Adjustment event). • The contents of the H1 and H2 bytes will be decremented by "1", and will be used as the new pointer from this point on. ***Note:*** *Once the user writes a "1" into this bit-field, the XRT94L33 will automatically clear this bit-field. Hence, there is no need to subsequently reset this bit-field to "0".*
2	Insert Positive Stuff	R/W	**Insert Positive Stuff:** This READ/WRITE bit-field permits the user to configure the Transmit STS-3c POH and Transmit STS-3 TOH Processor blocks to insert a positive-stuff into the outbound STS-3c/STS-3 data stream. This command, in-turn will cause a "Pointer Incrementing" event at the remote terminal. Writing a "0" to "1" transition into this bit-field causes the following to happen. • A positive-stuff will occur (e.g., a single stuff-byte will be inserted into the STS-3c/STS-3 data-stream, immediately after the H3 byte position within the outbound STS-3c/STS-3 data stream). • The "I" bits, within the H1 and H2 bytes will be inverted (to denote a "Incrementing" Pointer Adjustment event). • The contents of the H1 and H2 bytes will be incremented by "1", and will be used as the new pointer from this point on. ***Note:*** *Once the user writes a "1" into this bit-field, the XRT94L33 will automatically clear this bit-field. Hence, there is no need to subsequently reset this bit-field to "0".*
1	Insert Continuous NDF Events	R/W	**Insert Continuous NDF Events:** This READ/WRITE bit-field permits the user configure the Transmit STS-3c POH and Transmit STS-3 TOH Processor blocks to continuously insert a New Data Flag (NDF) pointer adjustment into the outbound STS-3c/STS-3 data stream. ***Note:*** *As the Transmit STS-3c POH and Transmit STS-3 TOH Processor blocks insert the NDF event into the STS-1/STS-3 data stream, it will proceed to load in the contents of the "Transmit STS-3c POH Arbitrary H1 Pointer" and "Transmit STS-3c POH Arbitrary H2 Pointer" registers into the H1 and H2 bytes (within the outbound STS-3c/STS-3 data stream).* 0 – Configures the "Transmit STS-3c TOH and Transmit STS-3 POH Processor" blocks to not continuously insert NDF events into the "outbound" STS-3c/STS-3 data stream. 1- Configures the "Transmit STS-3c TOH and Transmit STS-3 POH Processor" blocks to continuously insert NDF events into the "outbound" STS-3c/STS-3 data stream.
0	Insert Single NDF Event	R/W	**Insert Single NDF Event:** This READ/WRITE bit-field permits the user to configure the Transmit STS-3c POH and Transmit STS-3 TOH Processor blocks to insert a New Data Flag (NDF) pointer adjustment into the outbound STS-3c/STS-3 data stream.

			Writing a "0" to "1" transition into this bit-field causes the following to happen. • The "N" bits, within the H1 byte will set to the value "1001" • The ten pointer-value bits (within the H1 and H2 bytes) will be set to new pointer value per the contents within the "Transmit STS-3c POH – Arbitrary H1 Pointer" and "Transmit STS-3c POH Arbitrary H2 Pointer" registers (Address Location= 0xN9BF and 0xN9C3). • Afterwards, the "N" bits will resume their normal value of "0110"; and this new pointer value will be used as the new pointer from this point on. ***Note:*** *1. Once the user writes a "1" into this bit-field, the XRT94L33 will automatically clear this bit-field. Hence, there is no need to subsequently reset this bit-field to "0".* *2. The Address Location of the Transmit STS-3c Arbitrary H1 Pointer Byte register is 0x19BF* *3. The Address Location of the Transmit STS-3c Arbitrary H2 Pointer Byte register is 0x19C3*

Table 245: Transmit STS-3c Path – Transmit Path Trace Message Control Register (Address Location= 0x19BB)

1.9.1 RECEIVE SONET POH PROCESSOR BLOCK REGISTER DESCRIPTION

Table 255: Receive SONET Path – Control Register – Byte 1 (Address Location= 0xN182, where N ranges in value from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused							DS3 AIS upon Async PDI-P or AIS-P
R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 1	Unused	R/O	
0	DS3 AIS upon Async PDI-P or AIS-P	R/W	**DS3 AIS upon Async PDI-P or AIS-P:** This READ/WRITE bit-field permits the user to configure the Receive SONET POH Processor block to automatically command the DS3/E3 Framer Block to transmit the DS3 AIS indicator (to downstream circuitry) whenever (and for the duration that) it (the Receive SONET POH Processor block) declares the Async PDI-P or AIS-P defect condition within the incoming STS-1 SPE data-stream. 0 – Configures the Receive SONET POH Processor block to NOT automatically command the DS3/E3 Framer block to automatically transmit the DS3 AIS indicator (via the Egress Direction) upon declaration of either the AIS-P or the Async PDI-P defect conditions. 1 – Configures the Receive SONET POH Processor block to automatically command the DS3/E3 Framer block to automatically transmit the DS3 AIS indicator whenever (and for the duration that) it declares either the AIS-P or the PDI-P defect condition. ***Note:*** ***Note:*** *This register bit is only valid if the incoming STS-1 signal is transporting an asynchronous DS3 signal; and if the corresponding channel (on the "Low-Speed" Side of the chip) is configured to operate in the DS3 Mode. Whenever an STS-1 signal is transporting an asynchronously-mapped DS3 signal, then a given PTE will recognize and declare the PDI-P defect condition whenever it "accepts" the C2 byte to the value "0xFC".*

Table 256: Receive SONET Path – Control Register – Byte 0 (Address Location= 0xN183, where N ranges in value from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused				Check Stuff	RDI-P Type	REI-P Error Type	B3 Error Type
R/O	R/O	R/O	R/O	R/W	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 4	Unused	R/O	
3	Check Stuff	R/W	**Check (Pointer Adjustment) Stuff Select:** This READ/WRITE bit-field permits the user to enable/disable the SONET standard recommendation that a pointer increment or decrement operation, detected within 3 SONET frames of a previous pointer adjustment operation (e.g., negative stuff, positive stuff) is ignored. 0 – Disables this SONET standard implementation. In this mode, all pointer-adjustment operations that are detected will be accepted. 1 – Enables this "SONET standard" implementation. In this mode, all pointer-adjustment operations that are detected within 3 SONET frame periods of a previous pointer-adjustment operation, will be ignored.
2	RDI-P Type	R/W	**Path – Remote Defect Indicator Type Select:** This READ/WRITE bit-field permits the user to configure the Receive SONET POH Processor block to support either the "Single-Bit" or the "Enhanced" RDI-P form of signaling, as described below. 0 – Configures the Receive SONET POH Processor block to support the Single-Bit RDI-P. In this mode, the Receive SONET POH Processor block will only monitor Bit 5, within the G1 byte (of incoming SPE data), in order to declare and clear the RDI-P defect condition. 1 – Configures the Receive SONET POH Processor block to support the Enhanced RDI-P (ERDI-P). In this mode, the Receive SONET POH Processor block will monitor bits 5, 6 and 7, within the G1 byte, in order to declare and clear the RDI-P defect condition.
1	REI-P Error Type	R/W	**REI-P Error Type:** This READ/WRITE bit-field permits the user to specify how the "Receive SONET POH Processor block will count (or tally) REI-P events, for Performance Monitoring purposes. The user can configure the Receive SONET POH Processor block to increment REI-P events on either a "per-bit" or "per-frame" basis. If the user configures the Receive SONET POH Processor block to increment REI-P events on a "per-bit" basis, then it will increment the "Receive SONET Path REI-P Event Count" register by the value of the lower nibble within the G1 byte of the incoming STS-1 data-stream. If the user configures the Receive SONET POH Processor block to increment REI-P events on a "per-frame" basis, then it will increment the "Receive SONET Path REI-P Event Count" Register each time it receives an STS-1 frame, in which the lower nibble of the G1 byte (bits 1 through 4) are set to a "non-zero" value. 0 – Configures the Receive SONET POH Processor block to count or tally REI-P events on a per-bit basis. 1 – Configures the Receive SONET POH Processor block to count or tally

			REI-P events on a per-bit basis.
0	B3 Error Type	R/W	**B3 Error Type:** This READ/WRITE bit-field permits the user to specify how the "Receive SONET POH Processor block will count (or tally) B3 byte errors, for Performance Monitoring purposes. The user can configure the Receive SONET POH Processor block to increment B3 byte errors on either a "per-bit" or "per-frame" basis. If the user configures the Receive SONET POH Processor block to increment B3 byte errors on a "per-bit" basis, then it will increment the "Receive SONET Path B3 Byte Error Count" register by the number of bits (within the B3 byte value of the incoming STS-1 data-stream) that is in error. If the user configures the Receive SONET POH Processor block to increment B3 byte errors on a "per-frame" basis, then it will increment the "Receive SONET Path – B3 Byte Error Count" register each time it receives an STS-1 SPE that contains an erred B3 byte. 0 – Configures the Receive SONET POH Processor block to count B3 byte errors on a "per-bit" basis. 1 – Configures the Receive SONET POH Processor block to count B3 byte errors on a "per-frame" basis.

Table 257: Receive SONET Path – Control Register – Byte 0 (Address Location= 0xN186, where N ranges in value from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0

R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 2	Unused	R/O	
1	DS3 Async PDI-P Defect Declared	R/O	**Asynchronously-Mapped DS3 PDI-P (Payload Defect Indicator) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive SONET POH Processor block is currently declaring the "Asynchronous DS3 PDI-P defect condition. The Receive SONET POH Processor will declare the "Asynchronous DS3 PDI-P" defect condition for the duration that it has "accepted" the C2 byte value of "0xFC". 0 – Indicates that the Receive SONET POH Processor block is NOT currently declaring the "Asynchronous DS3 PDI-P" defect condition. 1 – Indicates that the Receive SONET POH Processor block is currently declaring the "Asynchronous DS3 PDI-P" defect condition. ***Notes:*** *This register bit is only valid if the incoming STS-1 signal is transporting an asynchronously-mapped DS3 signal; and if the corresponding channel (on the "low-speed" side of the chip) is configured to operate in the DS3 Mode.*
0	Path Trace Message Unstable Defect Declared	R/O	**Path Trace Message Unstable Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive SONET POH Processor block is currently declaring the Path Trace Message Unstable defect condition. The Receive SONET POH Processor block will declare the Path Trace Message Unstable defect condition, whenever the "Path Trace Message Unstable" counter reaches the value "8". The Receive SONET POH Processor block will increment the "Path Trace Message Unstable" counter each time that it receives a Path Trace message that differs from the previously received message. The Receive SONET POH Processor block will clear the "Path Trace Message Unstable" counter whenever it has received a given Path Trace Message 3 (or 5) consecutive times. 0 – Indicates that the Receive SONET POH Processor block is NOT currently declaring the "Path Trace Message Unstable" defect condition. 1 – Indicates that the Receive SONET POH Processor block is currently declaring the Path Trace Message Unstable defect condition.

Table 258: Receive SONET Path – SONET Receive POH Status – Byte 0 (Address Location= 0xN187, where N ranges in value from 0x02 to 0x04)

R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	TIM-P Defect Declared	R/O	**Trace Identification Mismatch (TIM-P) Defect Indicator:** This READ-ONLY bit-field indicates whether or not the Receive SONET POH Processor block is currently declaring the "Path Trace Identification Mismatch" (TIM-P) defect condition. The Receive SONET POH Processor block will declare the "TIM-P" defect condition, when none of the Path Trace Message bytes within the most recently Path Trace Message (received via the incoming STS-1 data-stream) matches the contents of the "expected" Path Trace message. The Receive SONET POH Processor block will clear the "TIM-P" defect condition, when at least 80% of the received Path Trace Message bytes (within the most recently received Path Trace Message) matches the contents of the "expected" Path Trace message. 0 – Indicates that the Receive SONET POH Processor block is NOT currently declaring the TIM-P defect condition. 1 – Indicates that the Receive SONET POH Processor block is currently declaring the TIM-P defect condition.
6	C2 Byte Unstable Defect Declared	R/O	**C2 Byte (Path Signal Label Byte) Unstable Indicator:** This READ-ONLY bit-field indicates whether or not the Receive SONET POH Processor block is currently declaring the "C2 Byte Unstable" defect condition. The Receive SONET POH Processor block will declare the "C2 Byte Unstable" defect condition, whenever the "C2 Byte Unstable" counter reaches the value of "5". The Receive SONET POH Processor block will increment the "C2 Unstable" counter each time that it receives an SPE with a C2 byte value that differs from the previously received C2 byte value. The Receive SONET POH Processor block will clear the contents of the "C2 Unstable" counter to "0" whenever it has received 3 (or 5) consecutive SPEs of the same C2 byte value. 0 – Indicates that the Receive SONET POH Processor block is NOT currently declaring the C2 (Path Signal Label Byte) Unstable defect condition is NOT declared. 1 – Indicates that the Receive SONET POH Processor block is currently declaring the C2 (Path Signal Label Byte) Unstable defect condition.
5	UNEQ-P Defect Declared	R/O	**Path – Unequipped (UNEQ-P) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive SONET POH Processor block is currently declaring the UNEQ-P defect condition. The Receive SONET POH Processor block will declare the UNEQ-P defect condition, anytime that it, unexpectedly receives at least five (5) consecutive STS-1 frames, in which the C2 byte was set to the value "0x00" (which indicates that the SPE is "Unequipped"). The Receive SONET POH Processor block will clear the UNEQ-P defect

			condition, if it receives at least five (5) consecutive STS-1 frames, in which the C2 byte was set to a value other than 0x00. 0 – Indicates that the Receive SONET POH Processor block is NOT declaring the UNEQ-P defect condition. 1 – Indicates that the Receive SONET POH Processor block is currently declaring the UNEQ-P defect condition. ***Note:*** *The Receive SONET POH Processor block will not declare the UNEQ-P defect condition if it configured to expect to receive SONET frames with C2 bytes being set to "0x00" (e.g., if the "Receive SONET Path – Expected Path Label Value" Register –Address Location= 0xN197) is set to "0x00".*
4	PLM-P Defect Declared	R/O	**Path Payload Mismatch (PLM-P) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive SONET POH Processor block is currently declaring the PLM-P defect condition. The Receive SONET POH Processor block will declare the PLM-P defect condition, if it receives at least five (5) consecutive STS-1 frames, in which the C2 byte was set to a value other than that which it is expecting to receive. Whenever the Receive SONET POH Processor block is checking in order to determine whether or not it should declare the PLM-P defect, it will check the contents of the following two registers. • The "Receive SONET Path – Received Path Label Value" Register (Address Location= 0xN196). • The "Receive SONET Path – Expected Path Label Value" Register (Address Location= 0xN197). The "Receive SONET Path – Expected Path Label Value" Register contains the value of the C2 bytes, that the Receive SONET POH Processor blocks expects to receive. The "Receive SONET Path – Received Path Label Value" Register contains the value of the C2 byte, that the Receive SONET POH Processor block has most recently "accepted" or "validated" (by receiving this same C2 byte in five consecutive SONET frames). The Receive SONET POH Processor block will declare a PLM-P defect condition; if the contents of these two register do not match. The Receive SONET POH Processor block will clear the PLM-P defect condition if whenever the contents of these two registers do match. 0 – Indicates that the Receive SONET POH Processor block is NOT currently declaring the PLM-P defect condition. 1 – Indicates that the Receive SONET POH Processor block is currently declaring the PLM-P defect condition. ***NOTES:*** 1. *The Receive SONET POH Processor block will clear the PLM-P defect condition, upon declaring the UNEQ-P defect condition.* 2. *If the Receive SONET POH Processor block unexpectedly accepts the C2 byte value of "0x00", then it will NOT declare the PLM-P defect condition. In this case, the Receive SONET POH Processor block will declare the UNEQ-P defect condition*
3	RDI-P Defect Declared	R/O	**Path Remote Defect Indicator (RDI-P) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive SONET POH Processor block is currently declaring the RDI-P defect condition. If the Receive SONET POH Processor block is configured to support the "Single-bit RDI-P" function, then it will declare the RDI-P defect condition if Bit 5

			(within the G1 byte of the incoming STS-1 frame) is set to "1" for "RDI-P_THRD" number of incoming consecutive STS-1 SPEs. If the Receive SONET POH Processor block is configured to support the Enhanced RDI-P" (ERDI-P) function, then it will declare the RDI-P defect condition if Bits 5, 6 and 7 (within the G1 byte of the incoming STS-1 frame) are set to either [0, 1, 0], [1, 0, 1] or [1, 1, 0] for "RDI-P_THRD" number of consecutive STS-1 frames. 0 – Indicates that the Receive SONET POH Processor block is NOT declaring the RDI-P defect condition. 1 – Indicates that the Receive SONET POH Processor block is currently declaring the RDI-P defect condition. ***Note:*** *The user can specify the value for "RDI-P_THRD" by writing the appropriate data into Bits 3 through 0 (RDI-P THRD) within the "Receive SONET Path – SONET Receive RDI-P Register (Address Location= 0xN193).*
2	RDI-P Unstable Defect Declared	R/O	**RDI-P (Path – Remote Defect Indicator) Unstable Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive SONET POH Processor block is currently declaring the "RDI-P Unstable" defect condition. The Receive SONET POH Processor block will declare the "RDI-P Unstable" defect condition whenever the "RDI-P Unstable Counter" reaches the value "RDI-P THRD". The Receive SONET POH Processor block will increment the "RDI-P Unstable" counter each time that it receives an RDI-P value that differs from that of the previous STS-1 frame. The Receive SONET POH Processor block will clear the "RDI-P Unstable" counter to "0" whenever it has received the same RDI-P value is received in "RDI-P_THRD" consecutive STS-1 frames. 0 – Indicates that the Receive SONET POH Processor block is NOT currently declaring the RDI-P Unstable defect condition. 1 – Indicates that the Receive SONET POH Processor block is currently declaring the RDI-P Unstable defect condition. ***Note:*** *The user can specify the value for "RDI-P_THRD" by writing the appropriate data into Bits 3 through 0 (RDI-P THRD) within the "Receive SONET Path – SONET Receive RDI-P Register (Address Location= 0xN193).*
1	LOP-P Defect Declared	R/O	**Loss of PointerDefect Indicator (LOP-P) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive SONET POH Processor block is currently declaring the LOP-P (Loss of Pointer) defect condition. The Receive SONET POH Processor block will declare the LOP-P defect condition, if it cannot detect a valid pointer (H1 and H2 bytes, within the TOH) within 8 to 10 consecutive SONET frames. Further, the Receive SONET POH Processor block will declare the LOP-P defect condition, if it detects 8 to 10 consecutive NDF events. The Receive SONET POH Processor block will clear the LOP-P defect condition, whenever it detects valid pointer bytes (e.g., the H1 and H2 bytes, within the TOH) and normal NDF value for three consecutive incoming SONET frames. 0 – Indicates that the Receive SONET POH Processor block is NOT currently declaring the LOP-P defect condition. 1 – Indicates that the Receive SONET POH Processor block is currently declaring the LOP-P defect condition.
0	AIS-P Defect Declared	R/O	**Path AIS (AIS-P) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive SONET POH Processor block is currently declaring the AIS-P defect condition. The Receive

			SONET POH Processor block will declare the AIS-P defect condition if it detects all of the following conditions within three consecutive incoming STS-1 frames. • The H1, H2 and H3 bytes are set to an “All Ones” pattern. • The entire SPE is set to an “All Ones” pattern. The Receive SONET POH Processor block will clear the AIS-P defect condition whenever it detects a valid STS-1 pointer (H1 and H2 bytes) and a “set” of “normal” NDF for three consecutive STS-1 frames. 0 – Indicates that the Receive SONET POH Processor block is NOT currently declaring the AIS-P defect condition. 1 – Indicates that the Receive SONET POH Processor block s currently declaring the AIS-P defect condition. ***Note:*** *The Receive SONET POH Processor block will NOT declare the LOP-P defect condition if it detects an “All Ones” pattern in the H1, H2 and H3 bytes. It will, instead, declare the AIS-P defect condition.*

Table 259: Receive SONET Path – SONET Receive Path Interrupt Status – Byte 2 (Address Location= 0xN189, where N ranges in value from 0x02 to 0x04)

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Change in PDI-P Defect Condition Interrupt Status:	RUR	**Change in PDI-P Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in PDI-P Defect Condition" Interrupt condition has occurred since the last read of this register. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt in response to either of the following conditions. • Whenever the Receive SONET POH Processor block declares the DS3 Asynchronous PDI-P Defect Condition (e.g., whenever the Receive SONET POH Processor block accepts" a C2 byte value of "0xFC"). • Whenever the Receive SONET POH Processor block clears the DS3 Asynchronous PDI-P Defect Condition (e.g., whenever the Receive SONET POH Processor block has "removed" the C2 byte value of "0xFC" by accepting a different C2 byte value). 0 – Indicates that the "Change in PDI-P Defect Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change in PDI-P Defect Condition" Interrupt has occurred since the last read of this register. **NOTES:** 1. *This register bit is only valid if the incoming STS-1 signal is transporting an asynchronous DS3 signal; and if the corresponding channel (on the "low-speed" side of the XRT94L33 device) is configured to operate in the DS3 Mode.* 2. *The user can determine whether or not the Receive SONET POH Processor block is currently declaring the PDI-P defect condition by reading out the state of Bit 1 (DS3 Asynch PDI-P Defect Declared) within the "Receive SONET Path – Control Register – Byte 0" (Address = 0xN186).*
6 - 5	Unused	R/O	
4	Detection of AIS Pointer Interrupt Status	RUR	**Detection of AIS Pointer Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of AIS Pointer" interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive SONET POH Processor block will generate this interrupt anytime it detects an "AIS Pointer" in the

			incoming STS-1 data stream. ***Note:*** *An "AIS Pointer" is defined as a condition in which both the H1 and H2 bytes (within the TOH) are each set to an "All Ones" pattern.* 0 – Indicates that the "Detection of AIS Pointer" interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of AIS Pointer" interrupt has occurred since the last read of this register.
3	Detection of Pointer Change Interrupt Status	RUR	**Detection of Pointer Change Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of Pointer Change" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt anytime it accepts a new pointer value (e.g., H1 and H2 bytes, in the TOH bytes). 0 – Indicates that the "Detection of Pointer Change" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of Pointer Change" Interrupt has occurred since the last read of this register.
2	POH Capture Interrupt Status	RUR	**Path Overhead Data Capture Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "POH Capture" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt once the Z5 byte (e.g., the last POH byte) has been loaded into the POH Capture Buffer. The contents of the POH Capture Buffer will remain intact for one SONET frame period. Afterwards, the POH data, for the next SPE will be loaded into the "POH Capture" buffer. 0 – Indicates that the "POH Capture" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "POH Capture" Interrupt has occurred since the last read of this register. ***Note:*** *The user can obtain the contents of the POH, within the most recently received SPE by reading out the contents of address locations "0xN0D3" through "0xN0F3").*
1	Change in TIM-P Defect Condition Interrupt Status	RUR	**Change in TIM-P (Trace Identification Mismatch) Defect Condition Interrupt.** This RESET-upon-READ bit-field indicates whether or not the "Change in TIM-P" Defect Condition interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt in response to either of the following events. • Whenever the Receive SONET POH Processor block declares the TIM-P defect condition. • Whenever the Receive SONET POH Processor block clears the TIM-P defect condition. 0 – Indicates that the "Change in TIM-P Defect Condition" Interrupt has not occurred since the last read of this register. 1 – Indicates that the "Change in TIM-P Defect Condition" Interrupt has occurred since the last read of this register.

			NOTE: *The user can determine whether or not the Receive SONET POH Processor block is currently declaring the TIM-P defect condition by reading out the state of Bit 7 (TIM-P Defect Declared) within the "Receive SONET Path – Receive SONET POH Status Register – Byte 0 (Address = 0xN187).*
0	Change in Path Trace Message Unstable Defect Condition Interrupt Status	RUR	**Change in Path Trace Identification Message Unstable Defect Condition" Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in Path Trace Identification Message Unstable Defect Condition" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt in response to either of the following events. • Whenever the Receive SONET POH Processor block declare the "Path Trace Message Unstable" Defect Condition. • Whenever the Receive SONET POH Processor block clears the "Path Trace Message Unstable" Defect condition. 0 – Indicates that the "Change in Path Trace Message Unstable Defect Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change in Path Trace Message Unstable Defect Condition" Interrupt has occurred since the last read of this register.

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	New Path Trace Message Interrupt Status	RUR	**New Path Trace Message Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "New Path Trace Message" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt anytime it has accepted (or validated) and new Path Trace Message. 0 – Indicates that the "New Path Trace Message" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "New Path Trace Message" Interrupt has occurred since the last read of this register.
6	Detection of REI-P Event Interrupt Status	RUR	**Detection of REI-P Event Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of REI-P Event" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt anytime it detects an REI-P event within the incoming STS-1 data-stream. 0 – Indicates that the "Detection of REI-P Event" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of REI-P Event" Interrupt has occurred since the last read of this register.
5	Change in UNEQ-P Defect Condition Interrupt Status	RUR	**Change in UNEQ-P (Path – Unequipped) Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in UNEQ-P Defect Condition" interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt in response to either of the following conditions. • Whenever the Receive SONET POH Processor block declares the UNEQ-P Defect Condition. • Whenever the Receive SONET POH Processor block clears the UNEQ-P Defect Condition. 0 – Indicates that the "Change in UNEQ-P Defect Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change in UNEQ-P Defect Condition" Interrupt has

			occurred since the last read of this register. ***Note:*** *The user can determine if the Receive SONET POH Processor block is currently declaring the UNEQ-P defect condition by reading out the state of Bit 5 (UNEQ-P Defect Declared) within the "Receive SONET Path – SONET Receive POH Status – Byte 0" Register (Address Location= 0xN187).*
4	Change in PLM-P Defect Condition Interrupt Status	RUR	**Change in PLM-P (Path – Payload Mismatch) Defect Condition Interrupt Status:** This RESET-upon-READ bit indicates whether or not the "Change in PLM-P Defect Condition" interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt in response to either of the following conditions. • Whenever the Receive SONET POH Processor block declares the "PLM-P" Defect Condition. • Whenever the Receive SONET POH Processor block clears the "PLM-P" Defect Condition. 0 – Indicates that the "Change in PLM-P Defect Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change in PLM-P Defect Condition" Interrupt has occurred since the last read of this register. ***NOTE:*** *The user can determine if the Receive SONET POH Processor block is currently declaring the PLM-P defect condition by reading out the state of Bit 4 (PLM-P Defect Declared) within the "Receive SONET Path – SONET Receive POH Status – Byte 0" Register (Address Location = 0xN187).*
3	New C2 Byte Interrupt Status	RUR	**New C2 Byte Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "New C2 Byte" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt anytime it has accepted a new C2 byte. 0 – Indicates that the "New C2 Byte" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "New C2 Byte" Interrupt has occurred since the last read of this register. ***NOTE:*** *Once the Receive SONET POH Processor block has "accepted" a new C2 byte value, it will load the value of this byte into the "Receive SONET Path – Receive Path Label Value" Register (Address = 0xN196).*
2	Change in C2 Byte Unstable Defect Condition Interrupt Status	RUR	**Change in C2 Byte Unstable Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in C2 Byte Unstable Defect Condition" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt in response to either of the following events. • Whenever the Receive SONET POH Processor block declares the "C2 Byte Unstable" defect condition. • Whenever the Receive SONET POH Processor block clears the "C2 Byte Unstable" defect condition. 0 – Indicates that the "Change in C2 Byte Unstable Defect Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change in C2 Byte Unstable Defect Condition"

			Interrupt has occurred since the last read of this register. ***Note:*** *The user can determine whether or not the Receive SONET POH Processor block is currently declaring the "C2 Byte Unstable Defect Condition" by reading out the state of Bit 6 (C2 Byte Unstable Defect Declared) within the "Receive SONET Path – SONET Receive POH Status – Byte 0" Register (Address Location= 0xN187).*
1	Change in RDI-P Unstable Defect Condition Interrupt Status	RUR	**Change in RDI-P Unstable Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in RDI-P Unstable Defect Condition" interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt in response to either of the following conditions. • Whenever the Receive SONET POH Processor block declares the "RDI-P Unstable" defect condition. • When the Receive SONET POH Processor block clears the "RDI-P Unstable" defect condition. 0 – Indicates that the "Change in RDI-P Unstable Defect Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change in RDI-P Unstable Defect Condition" Interrupt has occurred since the last read of this register. ***Note:*** *The user can determine whether or not the Receive SONET POH Processor block is currnelty declaring the "RDI-P Unstable Defect Condition" by reading out the state of Bit 2 (RDI-P Unstable Defect Condition) within the "Receive SONET Path – SONET Receive POH Status – Byte 0" Register (Address Location= 0xN187).*
0	New RDI-P Value Interrupt Status	RUR	**New RDI-P Value Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "New RDI-P Value" interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive SONET POH Processor block will generate this interrupt anytime it receives and "validates" a new RDI-P value. 0 – Indicates that the "New RDI-P Value" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "New RDI-P Value" Interrupt has occurred since the last read of this register. ***Note:*** *The user can obtain the "New RDI-P Value" by reading out the contents of the "RDI-P ACCEPT[2:0]" bit-fields. These bit-fields are located in Bits 6 through 4, within the "Receive SONET Path – SONET Receive RDI-P Register" (Address Location=0xN193).*

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Detection of B3 Byte Error Interrupt Status	RUR	**Detection of B3 Byte Error Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of B3 Byte Error" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt anytime it detects a B3 byte error in the incoming STS-1 data stream. 0 – Indicates that the "Detection of B3 Byte Error" Interrupt has NOT occurred since the last read of this interrupt. 1 – Indicates that the "Detection of B3 Byte Error" Interrupt has occurred since the last read of this interrupt.
6	Detection of New Pointer Interrupt Status	RUR	**Detection of New Pointer Interrupt Status:** This RESET-upon-READ indicates whether the "Detection of New Pointer" interrupt has occurred since the last read of this register. If the user enables this interrupt, then the Receive SONET POH Processor block will generate an interrupt anytime it detects a new pointer value in the incoming STS-1 frame. ***Note:*** *Pointer Adjustments with NDF will not generate this interrupt.* 0 – Indicates that the "Detection of New Pointer" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of New Pointer" Interrupt has occurred since the last read of this register.
5	Detection of Unknown Pointer Interrupt Status	RUR	**Detection of Unknown Pointer Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of Unknown Pointer" interrupt has occurred since the last read of this register. If the user enables this interrupt, then the Receive SONET POH Processor block will generate an interrupt anytime that it detects a "pointer" that does not fit into any of the following categories. • An Increment Pointer • A Decrement Pointer • An NDF Pointer • An AIS (e.g., All Ones) Pointer • New Pointer 0 – Indicates that the "Detection of Unknown Pointer" interrupt has NOT

			occurred since the last read of this register. 1 – Indicates that the "Detection of Unknown Pointer" interrupt has occurred since the last read of this register.
4	Detection of Pointer Decrement Interrupt Status	RUR	**Detection of Pointer Decrement Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of Pointer Decrement" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt anytime it detects a "Pointer Decrement" event. 0 – Indicates that the "Detection of Pointer Decrement" interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of Pointer Decrement" interrupt has occurred since the last read of this register.
3	Detection of Pointer Increment Interrupt Status	RUR	**Detection of Pointer Increment Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of Pointer Increment" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt anytime it detects a "Pointer Increment" event. 0 – Indicates that the "Detection of Pointer Increment" interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of Pointer Increment" interrupt has occurred since the last read of this register.
2	Detection of NDF Pointer Interrupt Status	RUR	**Detection of NDF Pointer Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of NDF Pointer" interrupt has occurred since the last read of this register. If the user enables this interrupt, then the Receive SONET POH Processor block will generate an interrupt anytime it detects an NDF Pointer event. 0 – Indicates that the "Detection of NDF Pointer" interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of NDF Pointer" interrupt has occurred since the last read of this register.
1	Change of LOP-P Defect Condition Interrupt Status	RUR	**Change of LOP-P Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in LOP-P Defect Condition" interrupt has occurred since the last read of this register. If the user enables this interrupt, then the Receive SONET POH Processor block will generate an interrupt in response to either of the following events. • Whenever the Receive SONET POH Processor block declares the LOP-P defect condition. • Whenever the Receive "SONET POH Processor" block clears the LOP-P defect condition. 0 – Indicates that the "Change in LOP-P Defect Condition" interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change in LOP-P Defect Condition" interrupt has occurred since the last read of this register. ***Note:*** *The user can determine if the Receive SONET POH Processor block is currently declaring the LOP-P defect condition by reading out the state of Bit 1 (LOP-P Defect Declared) within the "Receive*

			SONET Path – SONET Receive POH Status – Byte 0" Register (Address Location= 0xN187).
0	Change of AIS-P Defect Condition Interrupt Status	RUR	**Change of AIS-P Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change of AIS-P Defect Condition" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt in response to either of the following events. • Whenever the Receive SONET POH Processor block declares the AIS-P defect condition. • Whenever the Receive SONET POH Processor block clears the AIS-P defect condition. 0 – Indicates that the "Change of AIS-P Defect Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change of AIS-P Defect Condition" Interrupt has occurred since the last read of this register. ***Note:*** *The user can determine if the Receive SONET POH Processor block is currently declaring the AIS-P defect condition by reading out the state of Bit 0 (AIS-P Defect Declared) within the "Receive SONET Path – SONET Receive POH Status – Byte 0" Register (Address Location= 0xN187).*

Table 262: Receive SONET Path – SONET Receive Path Interrupt Enable – Byte 2 (Address Location= 0xN18D, where N ranges in value from 0x02 to 0x04)

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Change in PDI-P Defect Condition Interrupt Enable	R/W	**Change in PDI-P Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in PDI-P Defect Condition" Interrupt. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt in response to either of the following conditions. • Whenever the Receive SONET POH Processor block declares the DS3 Asynchronous PDI-P defect condition (e.g, whenever it accepts a C2 byte value of "0xFC"). • Whenever the Receive SONET POH Processor block clears the DS3 Asychronous PDI-P defect condition (e.g., whenever it has "removed" the C2 byte value of "0xFC" by accepting a different C2 byte value). 0 – Disables the "Change in PDI-P Defect Condition" Interrupt. *1 – Enables the "Change in PDI-P Defect Condition" Interrupt.* ***NOTES:*** 1. *This register bit is only valid if the incoming STS-1 signal is transporting an asynchronously-mapped DS3 signal; and if the corresponding channel (on the "low-speed" side of the XRT94L33 device) is configured to operate in the DS3 Mode.* 2. *The user can determine whether or not the Receive SONET POH Processor block is currently declaring the PDI-P defect condition by reading out the state of Bit 1 (DS3 Async PDI-P Defect Declared) within the Receive SONET Path – Control Register – Byte 0 (Address = 0xN186).*
6 - 5	Unused	R/O	
4	Detection of AIS Pointer Interrupt Enable	R/W	**Detection of AIS Pointer Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of AIS Pointer" interrupt. If the user enables this interrupt, then the Receive SONET POH Processor block will generate an interrupt anytime it detects an "AIS Pointer", in the incoming STS-1 data stream. ***Note:*** *An "AIS Pointer" is defined as a condition in which both the H1 and H2 bytes (within the TOH) are each set to an "All Ones" Pattern.* 0 – Disables the "Detection of AIS Pointer" Interrupt.

			1 – Enables the "Detection of AIS Pointer" Interrupt.
3	Detection of Pointer Change Interrupt Enable	R/W	**Detection of Pointer Change Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of Pointer Change" Interrupt. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt anytime it has accepted a new pointer value. 0 – Disables the "Detection of Pointer Change" Interrupt. 1 – Enables the "Detection of Pointer Change" Interrupt.
2	POH Capture Interrupt Enable	R/W	**Path Overhead Data Capture Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "POH Capture" Interrupt. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt once the Z5 byte (e.g., the last POH byte) has been loaded into the POH Capture Buffer. The contents of the POH Capture Buffer will remain intact for one SONET frame period. Afterwards, the POH data for the next SPE will be loaded into the "POH Capture" Buffer. 0 – Disables the "POH Capture" Interrupt 1 – Enables the "POH Capture" Interrupt.
1	Change in TIM-P Defect Condition Interrupt Enable	R/W	**Change in TIM-P (Trace Identification Mismatch) Defect Condition Interrupt:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in TIM-P Defect Condition" interrupt. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt in response to either of the following events. • Whenever the Receive SONET POH Processor block declares the TIM-P defect condition. • Whenever the Receive SONET POH Processor block clears the TIM-P defect condition. 0 – Disables the "Change in TIM-P Defect Condition" Interrupt. 1 – Enables the "Change in TIM-P Defect Condition" Interrupt. ***NOTE:*** *The user can determine whether or not the Receive SONET POH Processor block is currently declaring the TIM-P defect condition by reading out the state of Bit 7 (TIM-P Defect Declared) within the "Receive SONET Path – Receive SONET POH Status Register – Byte 0 (Address = 0xN187).*
0	Change in Path Trace Message Unstable Condition Interrupt Enable	R/W	**Change in "Path Trace Message Unstable Defect Condition" Interrupt Status:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in Path Trace Message Unstable Defect Condition" Interrupt. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt in response to either of the following events. • Whenever the Receive SONET POH Processor block declares the "Path Trace Message Unstable" defect Condition. • Whenever the Receive SONET POH Processor block clears the "Path Trace Message Unstable" defect Condition. 0 – Disables the "Change in Path Trace Message Unstable Defect Condition" interrupt.

			1 – Enables the "Change in Path Trace Message Unstable Defect Condition" interrupt.

7	NEW Path Trace Message Interrupt Enable	R/W	**New Path Trace Message Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "New Path Trace Message" Interrupt. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt anytime it has accepted (or validated) and new Path Trace Message. 0 – Disables the "New Path Trace Message" Interrupt. 1 – Enables the "New Path Trace Message" Interrupt.
6	Detection of REI-P Event Interrupt Enable	R/W	**Detection of REI-P Event Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of REI-P Event" Interrupt. If this interrupt is enabled, then he Receive SONET POH Processor block will generate an interrupt anytime it detects an REI-P event within the coming STS-1 data-stream. 0 – Disables the "Detection of REI-P Event" Interrupt. 1 – Enables the "Detection of REI-P Event" Interrupt.
5	Change in UNEQ-P Defect Condition Interrupt Enable	R/W	**Change in UNEQ-P (Path – Unequipped) Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in UNEQ-P Defect Condition" interrupt. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt in response to either of the following conditions. • Whenever the Receive SONET POH Processor block declares the UNEQ-P Defect Condition. • Whenever the Receive SONET POH Processor block clears the UNEQ-P Defect Condition. 0 – Disables the "Change in UNEQ-P Defect Condition" Interrupt. 1 – Enables the "Change in UNEQ-P Defect Condition" Interrupt.
4	Change in PLM-P Defect Condition Interrupt Enable	R/W	**Change in PLM-P (Path – Payload Label Mismatch) Defect Condition Interrupt Enable:** This READ/WRITE bit permits the user to either enable or disable the "Change in PLM-P Defect Condition" interrupt.

			If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt in response to either of the following conditions. • Whenever the Receive SONET POH Processor block declares the "PLM-P" Defect Condition. • Whenever the Receive SONET POH Processor block clears the "PLM-P" Defect Condition. 0 – Disables the "Change in PLM-P Defect Condition" Interrupt. 1 – Enables the "Change in PLM-P Defect Condition" Interrupt.
3	New C2 Byte Interrupt Enable	R/W	**New C2 Byte Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "New C2 Byte" Interrupt. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt anytime it has accepted a new C2 byte. 0 – Disables the "New C2 Byte" Interrupt. 1 – Enables the "New C2 Byte" Interrupt. ***Note:*** *The user can obtain the value of this "New C2" byte by reading the contents of the "Receive SONET Path – Received Path Label Value" Register (Address Location= 0xN196).*
2	Change in C2 Byte Unstable Defect Condition Interrupt Enable	R/W	**Change in C2 Byte Unstable Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in C2 Byte Unstable Defect Condition" Interrupt. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt in response to either of the following events. • Whenever the Receive SONET POH Processor block declares the "C2 Byte Unstable" defect condition. • Whenever the Receive SONET POH Processor block clears the "C2 Byte Unstable" defect condition. 0 – Disables the "Change in C2 Byte Unstable Defect Condition" Interrupt. 1 – Enables the "Change in C2 Byte Unstable Defect Condition" Interrupt.
1	Change in RDI-P Unstable Defect Condition Interrupt Enable	R/W	**Change in RDI-P Unstable Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in RDI-P Unstable Defect Condition" interrupt. If this interrupt is enabled, then the Receive SONET POH Processor block will generate an interrupt in response to either of the following conditions. • Whenever the Receive SONET POH Processor block declares the "RDI-P Unstable" defect condition. • Whenever the Receive SONET POH Processor block clears the "RDI-P Unstable" defect condition. 0 – Disables the "Change in RDI-P Unstable Defect Condition" Interrupt. 1 – Enables the "Change in RDI-P Unstable Defect Condition" Interrupt.
0	New RDI-P Value Interrupt Enable	R/W	**New RDI-P Value Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "New RDI-P Value" interrupt. If this interrupt is enabled, then the Receive SONET POH Processor

			block will generate this interrupt anytime it receives and “validates” a new RDI-P value. 0 – Disables the “New RDI-P Value” Interrupt. 1 – Enable the “New RDI-P Value” Interrupt.

7	Detection of B3 Byte Error Interrupt Enable	R/W	**Detection of B3 Byte Error Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of B3 Byte Error" Interrupt. If the user enables this interrupt, then the Receive SONET POH Processor block will generate an interrupt anytime it detects a B3-byte error in the incoming STS-1 data-stream. 0 – Disables the "Detection of B3 Byte Error" interrupt. 1 – Enables the "Detection of B3 Byte Error" interrupt.
6	Detection of New Pointer Interrupt Enable	R/W	**Detection of New Pointer Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of New Pointer" interrupt. If the user enables this interrupt, then the Receive SONET POH Processor block will generate an interrupt anytime it detects a new pointer value in the incoming STS-1 frame. ***Note:*** *Pointer Adjustments with NDF will not generate this interrupt.* 0 – Disables the "Detection of New Pointer" Interrupt. 1 – Enables the "Detection of New Pointer" Interrupt.
5	Detection of Unknown Pointer Interrupt Enable	R/W	**Detection of Unknown Pointer Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of Unknown Pointer" interrupt. If the user enables this interrupt, then the Receive SONET POH Processor block will generate an interrupt anytime it detects a "Pointer Adjustment" that does not fit into any of the following categories. • An Increment Pointer. • A Decrement Pointer • An NDF Pointer • AIS Pointer • New Pointer. 0 – Disables the "Detection of Unknown Pointer" Interrupt. 1 – Enables the "Detection of Unknown Pointer" Interrupt.
4	Detection of Pointer Decrement Interrupt Enable	R/W	**Detection of Pointer Decrement Interrupt Enable:** This READ/WRITE bit-field permits the user to enable or disable the "Detection of Pointer Decrement" Interrupt. If the user enables this interrupt, then the Receive SONET POH Processor block will generate an interrupt anytime it detects a "Pointer-Decrement" event. 0 – Disables the "Detection of Pointer Decrement" Interrupt.

			1 – Enables the "Detection of Pointer Decrement" Interrupt.
3	Detection of Pointer Increment Interrupt Enable	R/W	**Detection of Pointer Increment Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of Pointer Increment" Interrupt. If the user enables this interrupt, then the Receive SONET POH Processor block will generate an interrupt anytime it detects a "Pointer Increment" event. 0 – Disables the "Detection of Pointer Increment" Interrupt. 1 – Enables the "Detection of Pointer Increment" Interrupt.
2	Detection of NDF Pointer Interrupt Enable	R/W	**Detection of NDF Pointer Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of NDF Pointer" Interrupt. If the user enables this interrupt, then the Receive SONET POH Processor block will generate an interrupt anytime it detects an NDF Pointer event. 0 – Disables the "Detection of NDF Pointer" interrupt. 1 – Enables the "Detection of NDF Pointer" interrupt.
1	Change of LOP-P Defect Condition Interrupt Enable	R/W	**Change of LOP-P Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in LOP (Loss of Pointer)" Defect Condition interrupt. If the user enables this interrupt, then the Receive SONET POH Processor will generate an interrupt in response to either of the following events. • Whenever the Receive SONET POH Processor block declares the LOP-P defect condition. • Whenever the Receive SONET POH Processor block clears the LOP-P defect condition. 0 – Disable the "Change of LOP-P Defect Condition" Interrupt. 1 – Enables the "Change of LOP-P Defect Condition" Interrupt. ***Note:*** *The user can determine if the Receive SONET POH Processor block is currently declaring the LOP-P defect condition by reading out the contents of Bit 1 (LOP-P Defect Declared) within the "Receive STS-1 Path – SONET Receive POH Status – Byte 0" (Address Location= 0xN187).*
0	Change of AIS-P Defect Condition Interrupt Enable	R/W	**Change of AIS-P Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change of AIS-P (Path AIS)" Defect Condition interrupt. If the user enables this interrupt, then the Receive SONET POH Processor block will generate an interrupt in response to either of the following events. • Whenever the Receive SONET POH Processor block declares the "AIS-P" defect condition. • Whenever the Receive SONET POH Processor block clears the "AIS-P" defect condition. 0 – Disables the "Change of AIS-P Defect Condition" Interrupt. 1 – Enables the "Change of AIS-P Defect Condition" Interrupt. ***Note:*** *The user can determine if the Receive SONET POH Processor block is currently declaring the AIS-P defect condition by reading out the contents of Bit 0 (AIS-P Defect Declared) within the "Receive SONET Path – SONET Receive POH Status – Byte 0" (Address Location= 0xN187).*

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 5	Unused	R/O	
4	Received Path Trace Message Buffer Read Select	R/W	**Receive Path Trace Message Buffer Read Selection:** This READ/WRITE bit-field permits a user to specify which of the following Receive Path Trace Message buffer segments that the Microprocessor will read out, whenever it reads out the contents of the Receive Path Trace Message Buffer. **m.** The "Actual" Receive Path Trace Message Buffer. The "Actual" Receive Path Trace Message Buffer contains the contents of the most recently received (and accepted) Path Trace Message via the incoming STS-1 data-stream. **n.** The "Expected" Receive Path Trace Message Buffer. The "Expected" Receive Path Trace Message Buffer contains the contents of the Path Trace Message that the user "expects" to receive from the remote PTE. The contents of particular buffer are usually specified by the user. 0 – Executing a READ to the Receive Path Trace Message Buffer, will return the contents within the "Actual" Receive Path Trace Message" buffer. 1 – Executing a READ to the Receive Path Trace Message Buffer will return the contents within the "Expected Receive Path Trace Message Buffer". ***Note:*** *In the case of the Receive SONET POH Processor block, the "Receive Path Trace Message Buffer" is located at Address Location 0xN500 through 0xN53F, where N ranges in value from 0x02 to 0x04.*
3	Path Trace Message Accept Threshold	R/W	**Path Trace Message Accept Threshold:** This READ/WRITE bit-field permits a user to select the number of consecutive times that the Receive SONET POH Processor block must receive a given Receive Path Trace Message, before it is accepted and loaded into the "Actual" Receive Path Trace Message buffer, as described below. 0 – Configures the Receive SONET POH Processor block to accept the incoming Path Trace Message after it has received it the third time in succession. 1 – Configures the Receive SONET POH Processor block to accept the Incoming Path Trace Message after it has received in

<table>
<tr><td></td><td></td><td></td><td>the fifth time in succession.</td></tr>
<tr><td>2</td><td>Path Trace Message Alignment Type</td><td>R/O</td><td>Path Trace Message Alignment Type:

This READ/WRITE bit-field permits a user to specify how the Receive SONET POH Processor block will locate the boundary of the incoming Path Trace Message (within the incoming STS-1 data-stream), as indicated below.

0 – Configures the Receive SONET POH Processor block to expect the Path Trace Message boundary to be denoted by a “Line Feed” character.

1 – Configures the Receive SONET POH Processor block to expect the Path Trace Message boundary to be denoted by the presence of a “1” in the MSB (most significant byte) of the very first byte (within the incoming Path Trace Message). In this caes, all of the remaining bytes (within the incoming Path Trace Message) will each have a “0” within their MSBs.</td></tr>
<tr><td>1 – 0</td><td>Receive Path Trace Message Length[1:0]</td><td>R/W</td><td>Receive Path Trace Message Length[1:0]:

These READ/WRITE bit-fields permit the user to specify the length of the Receive Path Trace Message that the Receive SONET POH Processor block will accept and load into the “Actual” Receive Path Trace Message Buffer. The relationship between the content of these bit-fields and the corresponding Receive Path Trace Message Length is presented below.
<table>

6	Transmit AIS-P (Downstream) upon C2 Byte Unstable	R/W	**Transmit Path AIS (Downstream, towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper block) upon Declaration of the Unstable C2 Byte Defect Condition:** This READ/WRITE bit-field permits the user to configure the Receive SONET POH Processor block to automatically transmit the Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper blocks), anytime (and for the duration that) it declares the Unstable C2 Byte defect condition within the "incoming" STS-1 data-stream. 0 – Does not configure the Receive SONET POH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper block) whenever it declares the "Unstable C2 Byte" defect condition. 1 – Configures the Receive SONET POH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper block) whenever (and for the duration that) it declares the "Unstable C2 Byte" defect condition. ***Note:*** *The user must also set Bit 0 (Transmit AIS-P Enable) to "1" to configure the Receive SONET POH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.*
5	Transmit AIS-P (Downstream) upon UNEQ-P	R/W	**Transmit Path AIS (Downstream, towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper blocks) upon Declaration of the UNEQ-P (Path – Unequipped) Defect Condition:** This READ/WRITE bit-field permits the user to configure the Receive SONET POH Processor block to automatically transmit the Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper block), anytime (and for the duration that) it declares the UNEQ-P defect condition. 0 – Does not configure the Receive SONET POH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper Block) whenever it declares the UNEQ-P defect condition. 1 – Configures the Receive SONET POH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the

			corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper block) whenever (and for the duration that) it declares the UNEQ-P defect condition. ***Note:*** *The user must also set Bit 0 (Transmit AIS-P Enable) to "1" to configure the Receive SONET POH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.*
4	Transmit AIS-P (Downstream) upon PLM-P	R/W	**Transmit Path AIS (Downstream, towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper block) upon Declaration of PLM-P (Path – Payload Label Mismatch) Defect Condition:** This READ/WRITE bit-field permits the user to configure the Receive SONET POH Processor block to automatically transmit the Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper block), anytime (and for the duration that) it declares the PLM-P defect condition. 0 – Does not configure the Receive SONET POH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper block) whenever it declares the PLM-P defect condition. 1 – Configures the Receive SONET POH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper block) whenever (and for the duration that) it declares the PLM-P defect condition. ***Note:*** *The user must also set Bit 0 (Transmit AIS-P Enable) to "1" to configure the Receive SONET POH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.*
3	Transmit AIS-P (Downstream) upon Path Trace Message Unstable	R/W	**Transmit Path AIS (Downstream, towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper block) upon declaration of the Path Trace Message Unstable Defect Condition:** This READ/WRITE bit-field permits the user to configure the Receive SONET POH Processor block to automatically transmit the Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper block), anytime (and for the duration that) it declares the Path Trace Message Unstable defect condition within the "incoming" STS-1 data-stream. 0 – Does not configure the Receive SONET POH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper block) whenever (and for the duration that) it declares the Path Trace Message Unstable defect condition within the "incoming" STS-1 data-stream. 1 – Configures the Receive SONET POH Processor block to automatically automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper block) whenever (and for the duration that) it declares the Path Trace Message Unstable defect condition. ***Note:*** *The user must also set Bit 0 (Transmit AIS-P Enable) to "1" to configure the Receive SONET POH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.*
2	Transmit AIS-P (Downstream) upon TIM-P	R/W	**Transmit Path AIS (Downstream towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper block) upon declaration o the TIM-P (Path Trace Identification Message Mismatch) defect condition:**

			This READ/WRITE bit-field permits the user to configure the Receive SONET POH Processor block to automatically transmit the Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper block), anytime (and for the duration that) it declares the TIM-P defect condition within the incoming STS-1 data-stream. 0 – Does not configure the Receive SONET POH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper block) whenever it declares the TIM-P defect condition. 1 – Configures the Receive SONET POH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper block) whenever (and for the duration that) it declares the TIM-P defect condition. ***Note:*** *The user must also set Bit 0 (Transmit AIS-P Enable) to "1" to configure the Receive SONET POH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.*
1	Transmit AIS-P (Downstream) upon LOP-P	R/W	**Transmit Path AIS (Downstream, towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper block) upon Declaration of the Loss of Pointer (LOP-P) Defect Condition:** This READ/WRITE bit-field permits the user to configure the Receive SONET POH Processor block to automatically transmit the Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper block), anytime (and for the duration that) it declares the LOP-P defect condition within the incoming STS-1 data-stream. 0 – Does not configure the Receive SONET POH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper block) whenever it declares the LOP-P defect condition. 1 – Configures the Receive SONET POH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper block)) whenever (and for the duration that) it declares the LOP-P defect condition. ***Note:*** *The user must also set Bit 0 (Transmit AIS-P Enable) to "1" to configure the Receive SONET POH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.*
0	Transmit AIS-P (Downstream) Enable	R/W	**Automatic Transmission of AIS-P Enable:** This READ/WRITE bit-field serves two purposes. It permits the user to configure the Receive SONET POH Processor block to automatically transmit the Path AIS (AIS-P) indicator, via the down-stream traffic (e.g., towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper block), upon declaration of either the UNEQ-P, PLM-P, TIM-P, LOP-P or the Path Trace Message Unstable defect conditions. It also permits the user to configure the Receive SONET POH Processor block to automatically transmit a Path (AIS-P) Indicator via the "downstream" traffic (e.g., towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapper block) anytime (and for the duration that) it declares the AIS-P defect condition within the "incoming " STS-1 data-stream. 0 – Configures the Receive SONET POH Processor block to NOT automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the corresponding Transmit STS-1 POH Processor or DS3/E3

			Mapper block) whenever it declares any of the "above-mentioned" defect conditions. 1 – Configures the Receive SONET POH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the corresponding Transmit STS-1 POH Processor or DS3/E3 Mapp;er block) whenver (and for the duration that) it declares any of the "above-mentioned" condition. ***Note:*** *The user must also set the corresponding bit-fields (within this register) to "1" in order to configure the Receive SONET POH Processor block to automatically transmit the AIS-P indicator upon detection of a given alarm/defect condition.*

1	Transmit AIS-P or DS3/E3 AIS (via Downstream STS-1s or DS3/E3s) upon AIS-P	R/W	**Transmit AIS-P or DS3/E3 AIS (via Downstream STS-1s or DS3/E3 signals) upon declaration of the AIS-P defect condition:** The exact function of this register bit-field depends upon whether the channel has been configured to operate in the STS-1 or DS3/E3 Mode, as described below. **If the Channel has been configured to operate in the STS-1 Mode:** This READ/WRITE bit-field permits the user to configure the Transmit STS-1 POH Processor block (within the corresponding channel) to automatically transmit the AIS-P (Path AIS) Indicator via the "downstream" STS-1 signal, anytime (and for the duration that) the Receive SONET POH Processor block declares the AIS-P defect condition. **If the Channel has been configured to operate in the DS3/E3 Mode:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Framer block (within the corresponding channel) to automatically transmit the DS3/E3 AIS indicator via the "downstream" DS3/E3 signal, anytime (and for the duration that) the Receive SONET POH

			Processor block declares the AIS-P defect condition. 0 – Does not configure the corresponding Transmit STS-1 POH Processor (or DS3/E3 Framer) block to automatically transmit the AIS-P (or DS3/E3 AIS) Indicator via the "downstream" STS-1 (or DS3/E3) signals, anytime the Receive SONET POH Processor block declares the AIS-P defect condition. 1 – Configures the corresponding Transmit STS-1 POH Processor (or DS3/E3 Framer) block to automatically transmit the AIS-P (or DS3/E3 AIS) Indicator via the "downstream" STS-1 (or DS3/E3) signal, anytime (and for the duration that) the Receive SONET POH Processor block declares the AIS-P defect condition.
0	Transmit DS3 AIS (via Downstream DS3s) upon PDI-P	R/W	**Transmit DS3 AIS upon PDI-P or AIS-P:** This READ/WRITE bit-field permits the user to configure the Receive SONET POH Processor block to automatically command the DS3/E3 Framer block to transmit an AIS signal (to downstream circuitry) whenever it (the Receive SONET POH Processor block) detects an Async PDI-P or an AIS-P condition, in the incoming STS-1 SPE data-stream. 0 – Configures the Receive SONET POH Processor block to NOT command the DS3/E3 Framer block to automatically transmit an AIS signal upon detection of an AIS-P or a PDI-P condition. 1 – Configures the Receive SONET POH Processor block to command the DS3/E3 Framer block to automatically transmit an AIS signal upon detection of an AIS-P or PDI-P. ***Note:*** ***Note:*** *This register bit is only valid if the incoming STS-1 signal is transporting an asynchronous DS3 signal; and if the corresponding channel is configured to operate in the DS3 Mode. When an asynchronous DS3 signal is being transported by a SONET signal, the PDI-P condition is indicated by setting the C2 byte to the value "0xFC".*

Table 282: Receive SONET Path – Receive J1 Byte Capture Register (Address Location= 0xN1D3, where N ranges in value from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
J1_Byte_Captured_Value[7:0]							
R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 0	J1_Byte_Captured_Value[7:0]	R/O	**J1 Byte Captured Value[7:0]** These READ-ONLY bit-fields contain the value of the J1 byte, within the most recently received SONET frame. This particular value is stored in this register for one SONET frame period. During the next SONET frame period, this value will be overridden with a new J1 byte value.

Table 283: Receive SONET Path – Receive B3 Byte Capture Register (Address Location= 0xN1D7, where N ranges in value from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
B3_Byte_Captured_Value[7:0]							
R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 0	B3_Byte_Captured_Value[7:0]	R/O	**B3 Byte Captured Value[7:0]** These READ-ONLY bit-fields contain the value of the B3 byte, within the most recently received SONET frame. This particular value is stored in this register for one SONET frame period. During the next SONET frame period, this value will be overridden with a new B3 byte value.

Table 284: Receive SONET Path – Receive C2 Byte Capture Register (Address Location= 0xN1DB, where N ranges in value from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
C2_Byte_Captured_Value[7:0]							
R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 0	C2_Byte_Captured_Value[7:0]	R/O	**C2 Byte Captured Value[7:0]** These READ-ONLY bit-fields contain the value of the C2 byte, within the most recently received SONET frame. This particular value is stored in this register for one SONET frame period. During the next SONET frame period, this value will be overridden with a new C2 byte value.

Table 285: Receive SONET Path – Receive G1 Byte Capture Register (Address Location= 0xN1DF, where N ranges in value from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
G1_Byte_Captured_Value[7:0]							
R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 0	G1_Byte_Captured_Value[7:0]	R/O	**G1 Byte Captured Value[7:0]** These READ-ONLY bit-fields contain the value of the G1 byte, within the most recently received SONET frame. This particular value is stored in this register for one SONET frame period. During the next SONET frame period, this value will be overridden with a new G1 byte value.

Table 286: Receive SONET Path – Receive F2 Byte Capture Register (Address Location=0xN1E3, where N ranges in value from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
F2_Byte_Captured_Value[7:0]							
R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 0	F2_Byte_Captured_Value[7:0]	R/O	**F2 Byte Captured Value[7:0]** These READ-ONLY bit-fields contain the value of the F2 byte, within the most recently received SONET frame. This particular value is stored in this register for one SONET frame period. During the next SONET frame period, this value will be overridden with a new F2 byte value.

Table 287: Receive SONET Path – Receive H4 Byte Capture Register (Address Location= 0xN1E7, where N ranges in value from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0

R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 0	Z5_Byte_Captured_Value[7:0]	R/O	**Z5 Byte Captured Value[7:0]** These READ-ONLY bit-fields contain the value of the Z5 byte, within the most recently received SONET frame. This particular value is stored in this register for one SONET frame period. During the next SONET frame period, this value will be overridden with a new Z5 byte value.

1.10 DS3/E3 FRAMER BLOCK

The register map for the DS3/E3 Framer Block is presented in the Table below. Additionally, a detailed description of each of the "DS3/E3 Framer" block registers is presented below.

In order to provide some orientation for the reader, an illustration of the Functional Block Diagram for the XRT94L33, with the "DS3/E3 Framer Block "highlighted" is presented below in Figure 7.

Figure 7: Illustration of the Functional Block Diagram of the XRT94L33 (whenever it has been configured to operate in the 3-Channel DS3/STS-1 to STS-3 Mode), with the DS3/E3 Framer Block "Highlighted

1.10.1 DS3/E3 FRAMER BLOCK REGISTER DESCRIPTION

Table 292: Operating Mode Register (Address Location= 0xN300, where N ranges from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Framer Local Loop Back	IsDS3	Internal LOS Enable	Software RESET	Unused	Frame Format	TimRefSel[1:0]	
R/W	R/W	R/W	R/W	R/O	R/W	R/W	R/W
0	0	1	0	0	0	1	1

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Framer Local Loop Back	R/W	**Framer Block Local Loop-back Mode:** This READ/WRITE bit field configures the corresponding DS3/E3 Framer block to operate in the Framer Local Loop-back Mode. If the DS3/E3 Framer block has been configured to operate in the Framer Local Loop-back Mode, then the output of the Frame Generator block will be internally looped back into the input of the Primary Frame Synchronizer block. 0 – Configures the DS3/E3 Framer block to to operate in the Normal Operating (e.g., Non-Framer Local Loop-back) Mode 1 – Configures the DS3/E3 Framer block to operate in the Framer Local Loop-back Mode
6	IsDS3	R/W	**Is DS3 Mode:** This READ/WRITE bit-field, along with Bit 2 (Frame Format), permits the user to configure the Frame Generator, the Primary Frame Synchronizer and the Secondary Frame Synchronizer blocks to operate in the appropriate framing format. The relationship between the state of this bit-field, Bit 2 and the resulting framing format is presented below. **Bit 6 (IsDS3) / Bit 2 (Frame Format) / Framing Format** 0 / 0 / E3, ITU-T G.751 0 / 1 / E3, ITU-T G.832 1 / 0 / DS3, C-bit Parity 1 / 1 / DS3, M13 **NOTE:** These bit settings apply to all three (3) sub-blocks within the DS3/E3 Framer block (e.g., the Primary Frame Synchronizer block, the Secondary Frame Synchronizer block and the Frame Generator block).
5	Internal LOS Enable	R/W	**Internal LOS Enable:** This READ/WRITE bit-field permits the user to enable or disable the “Internal LOS Detector”, within both the Primary and Secondary Frame Synchronizer blocks. If the user enables the “Internal LOS Detector”, then the Primary and/or Secondary Frame Synchronizer block will be configured to check the incoming DS3/E3 signal for a sufficient number of “consecutive” all-zeros bits and it will declare and clear the LOS defect condition based upon the “1s” density and the number of consecutive “0” bits within the incoming DS3/E3 data-stream. If the user disables the “Internal LOS Detector” then the Primary and/or Secondary Frame Synchronizer block will NOT be configured to check the incoming DS3/E3 signal for a sufficient number of “consecutive” 0 bits, and it

<table>
<tr><td></td><td></td><td></td><td>will NOT declare nor clear the LOS defect condition based upon the “1s” density and the number of consecutive “0” bits within the incoming DS3/E3 data-stream.

0 – Internal LOS Detector is disabled.

1 – Internal LOS Detector is enabled.

Note:

1. The Internal LOS Detector can only be enabled if the Channel is configured to operate in the Dual-Rail Mode. If the Channel is configured to operate in the Single-Rail Mode, then the Internal LOS Detector will be disabled.

2. The Primary Frame Synchronizer block or the Secondary Frame Synchronizer block (depending upon which block is configured to operate in the Ingress Path) will automatically declare the LOS defect condition anytime an off-chip LIU device asserts the corresponding “EXT_LOS_n” input pin, independent of the setting of this register bit.</td></tr>
<tr><td>4</td><td>RESET</td><td>R/W</td><td>Software RESET Input:

A “0” to “1” transition in this bit-field commands a Software RESET to each of the following blocks within the Channel.

• The Primary Frame Synchronizer Block
• The Secondary Frame Synchronizer Block
• The Ingress Direction Mapper Block
• The Egress Direction Mapper Block

Once the user executes a Software reset to the Channel, all of the internal state machines (within each of these blocks) will be reset; and the Primary and Secondary Frame Synchronizer blocks will execute a “Reframe” operation.

Note: For a Software Reset, the contents of the Command Registers within the corresponding DS3/E3 Framer block will not be reset to their default values.</td></tr>
<tr><td>3</td><td>Unused</td><td>R/O</td><td></td></tr>
<tr><td>2</td><td>Frame Format</td><td>R/W</td><td>Frame Format:

This READ/WRITE bit-field, along with Bit 6 (IsDS3), permits the user to configure the Frame Generator, the Primary Frame Synchronizer and the Secondary Frame Synchronizer blocks to operate in the appropriate framing format. The relationship between the state of this bit-field, Bit 2 and the resulting framing format is presented below.

<table>
<tr><th>Bit 6 (IsDS3)</th><th>Bit 2 (Frame Format)</th><th>Framing Format</th></tr>
<tr><td>0</td><td>0</td><td>E3, ITU-T G.751</td></tr>
<tr><td>0</td><td>1</td><td>E3, ITU-T G.832</td></tr>
<tr><td>1</td><td>0</td><td>DS3, C-bit Parity</td></tr>
<tr><td>1</td><td>1</td><td>DS3, M13</td></tr>
</table>
</td></tr>
<tr><td>1 - 0</td><td>TimRefSel[1:0]</td><td>R/W</td><td>Time Reference Select:

These two READ/WRITE bit-fields permit the user to define both the timing source and the framing-alignment source for the Frame Generator block, as</td></tr>
</table>

presented below.

TimRefSel[1:0]	Timing Reference	Framing Reference
00	Loop-Timing (Timing is taken from the Primary Frame Synchronizer block)	Asynchronous (The Frame Generator block will initiate the generation of a new DS3 or E3 frame, asynchronous to any signals within the Viper Device).
01	The clock source originating from traffic that is "up-stream" from the Frame Generator block.	Framing Alignment Information from either the Primary or Secondary Frame Synchronizer block (The Frame Generator block will initialte the generation of a new DS3 or E3 Frame based upon Framing Alignment information originating from either the Primary Frame Synchronizer block or the Secondary Frame Synchronizer block, depending upon which block is upstream from the Frame Generator block).
10	The clock source originating from traffic that is "up-stream" from the Frame Generator block.	Asynchronous (The Frame Generator block will initiate the generation of a new DS3 or E3 frame, asynchronous to any signals within the Viper Device).
11	The clock source originating from traffic that is "up-stream" from the Frame Generator block.	Asynchronous (The Frame Generator block will initiate the generation of a new DS3 or E3 frame, asynchronous to any signals within the Viper Device).

Note: *If the user has selected a Frame Generator/Frame Synchronizer configuration, in which the Frame Generator block is down-stream from either the Primary Frame Synchronizer block or the Secondary Frame Synchronizer block, then the user is strongly advised to set these bit-fields to "[0, 1]".*

Table 293: I/O Control Register (Address Location= 0xN301, where N ranges from 0x02 to 0x04)

1	0	1	0	1	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Disable TxLOC	R/W	**Disable Transmit Loss of Clock Feature:** This READ/WRITE bit-field permits the user to either enable or disable the "Transmit Loss of Clock" feature. If this feature is enabled, then the DS3/E3 Framer block will enable some circuitry that will terminate the current READ or WRITE access (to the Microprocessor Interface), if a "Loss of Transmit (or Frame Generator) Clock Event were to occur. The intent behind this feature is to prevent any READ/WRITE accesses (to the DS3/E3 Framer block) from "hanging" in the event of a "Loss of Clock" event. 0 – Enables the "Transmit Loss of Clock" feature. 1 - Disables the "Transmit Loss of Clock" feature.
6	LOC	R/O	**Loss of Clock Indicator:** This READ-ONLY bit-field indicates that the Channel has experiences a Loss of Clock event.
5	Disable RxLOC	R/W	**Disable Receive Loss of Clock Feature** This READ/WRITE bit-field permits the user to either enable or disable the "Receive Loss of Clock" feature. If this feature is enabled, then the DS3/E3 Framer block will enable some circuitry that will terminate the current READ or WRITE access (to the Microprocessor Interface), if a "Loss of Receiver (or Frame Synchronizer) Clock Event were to occur. The intent behind this feature is to prevent any READ/WRITE accesses (to the DS3/E3 Framer block) from "hanging" in the event of a "Loss of Clock" event. 0 – Enables the "Receive Loss of Clock" feature. 1 – Disables the "Receive Loss of Clock" feature.
4	AMI/Zero-Suppression	R/W	**AMI/Zero-Suppression Line Code Select - Primary Frame Synchronizer Block Input/ Frame Generator Block Output:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Framer Block (associated with channel N) to operate in either the AMI or B3ZS/HDB3 Line Code; as described below. 0 – Configures the DS3/E3 Framer Channel to operate in the B3ZS/HDB3 Line Code. 1- Configures the DS3/E3 Framer Channel to operate in the AMI Line Code.
3	Primary Frame - Single	R/W	**Primary Frame Synchronizer Block Input/Frame Generator Block Output - Single-Rail/Dual-Rail Select:**

	Rail/Dual Rail Select		This READ/WRITE bit-field permits the user to implement either of the following options. 1. *To configure the Primary Frame Synchonizer block to accept the Ingress DS3/E3 data (from the DS3/E3 LIU IC) in either the Single-Rail or Dual-Rail Manner.* 2. *To configure the DS3/E3 Frame Generator block to output the Egress DS3/E3 data (to the DS3/E3 LIU IC) in either rthe Single-Rail or Dual-Rail Manner.* More specifically, if the user configures the Primary Frame Synchronizer and the Frame Generator blocks to operate in the Single-Rail Mode, then the following will happen. • The Primary Frame Synchronizer block will accept data (from the LIU IC) in a Single-Rail Manner. • The Frame Generator block will output data (to the LIU IC) in a Single-Rail Manner. If the user configures the Primary Frame Synchronizer and Frame Generator blocks to operate in the Dual-Rail mode, then the following will happen. • The Primary Frame Synchronizer block will accept data (from the LIU IC) in a Dual-Rail Manner. • The Frame Generator block will output data (to the LIU IC) in a Dual-Rail Manner. 0 – Configures the Primary Frame Synchronizer/Frame Generator blocks to operate in the Dual-Rail Mode. 1 – Configures the Primary Frame Synchronizer/Frame Generator blocks to operate in the Single-Rail Mode. ***Note:*** *This bit-field is only valid if the Primary Frame Synchronizer block has been configured to operate in the Ingress Direction, and if the Frame Generator block has been configured to operate in the Egress Direction.*
2	Frame Generator Block - DS3/E3_ CLK_OUT Invert:		**Frame Generator Block - DS3/E3_CLK_OUT Invert:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block (of Channel n), within the XRT94L33, to update the "TxDS3POS_n" and "TxDS3NEG_n" output pins (pin B18, G24, AG9) upon either the rising or falling edge of "TxDS3LineClk_n" (pin C17, E25, AF10) 0 – "TxDS3POS_n/TxDS3NEG_n" is updated upon the rising edge of "TxDS3LineClk_n". The user should insure that the LIU IC will sample "TxDS3POS_n" upon the falling edge of "TxDS3LineClk_n". 1 – "TxDS3POS_n/TxDS3NEG_n" is updated upon the falling edge of "TxDS3LineClk_n". The user should insure that the LIU IC will sample "TxDS3POS_n/TxDS3NEG_n" pins upon the rising edge of "TxDS3LineClk_n". ***Note:*** *This bit-field is only active if the Frame Generator block has been configured to operate in the Egress Path.*
1	DS3/E3_ Clock Input - Invert	R/O	**DS3/E3_Clock Input - Invert:** This READ/WRITE bit-field permits the user to configure either the Primary or Secondary Frame Synchronizer block (depending upon which Synchronizer block is operating in the Ingress Path), within the XRT94L33; to sample and latch the "RxDS3POS_n" input pins (pin B14. C21. AG15)" upon either the rising or falling edge of "RxDS3LineClk_n" (pin D14, A24, AF14).. 0 – Configures the DS3/E3 Framer block circuitry to sample the "RxDS3POS_n/RxDS3NEG_n" input pins upon the falling edge of the "RxDS3LineClk_n" input signal. 1 – Configures the DS3/E3 Framer block circuitry to sample the

			"RxDS3POS_n/RxDS3NEG_n" input pins upon the rising edge of "RxDS3LineClk_n". **NOTE:** This register bit-field applies to either the Primary or Secondary Frame Synchronizer block (depending upon which block is operating in the Ingress Path).
0	Reframe	R/W	**Primary DS3/E3 Frame Synchronizer Block – Reframe Command:** A "0" to "1" transition, within this bit-field commands the Primary DS3/E3 Frame Synchronizer block (within Channel n) to exit the Frame Maintenance Mode, and go back and enter the Frame Acquisition Mode. ***Note:*** *The user should go back and set this bit-field to "0" following execution of the "Reframe" Command.*

Table 294: Block Interrupt Enable Register (Address Location= 0xN304, where N ranges from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Primary and/or Secondary DS3/E3 Frame Synch Block Interrupt Enable	R/W	**Primary and/or Secondary DS3/E3 Frame Synchronizer Block Interrupt Enable:** This READ/WRITE bit-field permits the user to enable or disable both the Primary and Secondary Frame Synchronizer blocks for Interrupt Generation. If the user enables the Primary and Secondary Frame Synchronizer blocks (for Interrupt Generation) at the block level, the user still needs to enable the interrupts at the "Source" level, as well; in order for these interrupts to be enabled. However, if the user disables the Primary and Secondary Frame Synchronizer block (for Interrupt Generation) at the Block Level, then ALL Frame Synchronizer-related blocks are disabled. 0 – Both the Primary and Secondary Frame Synchronizer blocks are Disabled for Interrupt Generation. 1 – Both the Primary and Secondary Frame Synchronizer blocks are enabled (at the Block level) for Interrupt Generation.
6 – 2	Unused	R/O	
1	DS3/E3 Frame Generator Block Interrupt Enable	R/W	**DS3/E3 Frame Generator Block Interrupt Enable:** This READ/WRITE bit-field permits the user to enable or disable the Frame Generator block for Interrupt Generation. If the user enables the Frame Generator block (for Interrupt Generation) at the block level, the user still needs to enable the interrupts at the "Source" level, as well; in order for these interrupts to be enabled. However, if the user disables the Frame Generator block (for Interrupt Generation) at the Block Level, then ALL Frame Generator-related blocks are disabled. 0 – Frame Generator block is Disabled for Interrupt Generation. 1 – Frame Generator block is Enabled (at the Block Level) for Interrupt Generation.
0	One Second Interrupt	R/W	**One Second Interrupt Enable:** This READ/WRITE bit-field permits the user to enable or disable the One-Second Interrupt, within Channel n. If the user enables this interrupt, then Channel n will generate an interrupt at one second intervals. 0 – One Second Interrupt is disabled. 1 – One Second Interrupt is enabled.

0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	TxOHSrc	R/W	**Transmit Overhead Bit Source:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to accept and insert overhead bits/bytes which are input via the "Transmit Payload Data Input Interface" block, as indicated below. 0 – No overhbead bit insertion will occur. Overhead bits/bytes are internally generated by the DS3/E3 Frame Generator block. 1 – Overhead bit insertion will occur. In this case, the Overhead bits/byte data is accepted from the Transmit Payload Data Input Interface block. ***Note:*** *This register bit applies to all framing formats that are supported by the Frame Generator block.*
6 - 5	Unused	R/O	
4	RxPRBS Lock	R/O	**PRBS Lock Indicator:** This READ-ONLY bit-field indicates whether or not the PRBS Receiver (within the Primary Frame Synchronizer block) has acquired "PRBS Lock" with the payload data of the incoming DS3 or E3 data stream, as described below. 0 – Indicates that the PRBS Receiver does not have PRBS Lock with the incoming data stream. 1 – Indicates that the PRBS Receiver does have PRBS Lock with the incoming data stream. ***Note:*** *This bit-field is not valid if the PRBS Receiver is disabled, or if the Primary Frame Synchronizer block is bypassed.*
3	RxPRBS Enable	R/W	**Receive PRBS Enable:** This READ/WRITE bit-field permits the user to either enable or disable the PRBS Receiver within the Primary Frame Synchronizer block. Once the user enables the PRBS Receiver, then it will proceed to attempt to acquire and maintain pattern (or PRBS Lock) within the payload bits, within the incoming DS3 or E3 data stream. 0 – Disables the PRBS Receiver. 1 – Enables the PRBS Receiver. ***Note:*** *This bit-field is ignored if the Frame Synchronizer block is by-passed.*
2	TxPRBS Enable	R/W	**Transmit PRBS Enable:** This READ/WRITE bit-field permits the user to either enable or disable the PRBS Generator within the DS3/E3 Frame Generator block. Once the user enables the PRBS Generator block, then it will proceed to insert a PRBS pattern into the payload bits, within the outbound DS3 or E3 data stream. 0 – Disables the PRBS Generator. 1 – Enables the PRBS Generator. ***Note:*** *This bit-field is ignored if the Frame Generator block is by-passed.*

1 - 0	Unused	R/O

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	DS3 AIS Defect Declared	R/O	**DS3 AIS Defect Declared Indicator – Primary Frame Synchronizer Block:** This READ-ONLY bit-field indicates whether or not the Primary Frame Synchronizer block is currently declaring the AIS defect condition in its incoming path, as described below. 0 – Indicates that the Primary Frame Synchronizer block is NOT currently declaring the DS3 AIS Defect condition. 1 – Indicates that the Primary Frame Synchronizer block is currently declaring the DS3 AIS Defect condition.
6	LOS Defect Declared	R/O	**LOS Defect Condition Declared Indicator – Primary Frame Synchronizer Block:** This READ-ONLY bit-field indicates whether or not the Primary Frame Synchronizer block is currently declaring the LOS defect condition, in its incoming path, as described below. 0 – Indicates that the Primary Frame Synchronizer block is NOT currently declaring the LOS defect condition in its incoming path. 1 – Indicates that the Primary Frame Synchronizer block is currently declaring the LOS defect condition in its incoming path.
5	DS3 Idle Condition Declared	R/O	**DS3 Idle Signal Pattern Detected – Primary Frame Synchronizer Block:** This READ-ONLY bit-field indicates whether or not the Primary Frame Synchronizer block is currently detecting the DS3 Idle pattern, in its incoming path. 0 – Indicates that the Primary Frame Synchronizer block is NOT currently detecting the DS3 Idle Pattern, in its incoming path. 1 – Indicates that the Primary Frame Synchronizer block is currently detecting the DS3 Idle Pattern in its incoming path. **NOTE:** This bit-field is only valid of the DS3/E3 Framer block has been configured to operate in the DS3 Mode.
4	OOF Defect Condition Declared	R/O	**OOF (Out of Frame) Defect Condition Declared Indicator – Primary Frame Synchronizer Block:** This READ-ONLY bit-field indicates whether or not the Primary Frame Synchronizer block is currently declaring the OOF (Out of Frame) defect condition, as described below. 0 – Indicates that the Primary Frame Synchronizer block is NOT currently declaring the OOF defect condition. 1 – Indicates that the Primary Frame Synchronizer block is currently declaring the OOF defect condition.

3	Unused	R/O	
2	Framing with Valid P Bits	R/W	**Framing with Valid P-Bit Select:** This READ/WRITE bit-field permits the user to choose between two different sets of DS3 Frame Acquisition/Maintenance criteria that the Primary Frame Synchronizer block will use to (1) acquire and declare Frame Synchronization, and (2) to declare the OOF defect condition. 0 – Normal Framing Acquisition/Maintenance Criteria (without P-bit Checking) In this mode, the Primary Frame Synchronizer block will declare the "In-frame" state, one it has successfully completed both the "F-Bit Search" and the "M-Bit Search" states. 1 – Framing Acquisition/Maintenance with P-bit Checking In this mode, the Primary Frame Synchronizer block will (in addition to passing through the "F-Bit Search" and "M-Bit Search" states) also verify valid P-bits, prior to declaring the "In-Frame" state. ***Note:*** *This bit-field is ignored if the DS3/E3 Framer block is configured to operate in the E3 Mode, or if the Primary Frame Synchronizer block is by-passed.*
1	F-Sync Algo	R/W	**F-Bit Search State Criteria Select:** This READ/WRITE bit-field permits the user to choose between two different sets of DS3 Out of Frame (OOF) Declaration criteria. 0 – Configures the Primary Frame Synchronizer block to declare the OOF defect condition anytime it determines that 6 out of the last 15 F-bits are erred. 1 – Configures the Primary Frame Synchronizer block to declare the OOF is defect condition anytime it determines that 3 out of the last 15 F-bits are erred. ***Note:*** *This bit-field is ignored if the DS3/E3 Framer block has been configured to operate in the E3 Mode, or if the Primary Frame Synchronizer block is by-passed.*
0	M-Sync Algo	R/W	**M-Bit Search State Criteria Select:** This READ/WRITE bit-field permits the user to choose between two different sets of DS3 Out of Frame (OOF) Declaration criteria. 0 – Configures the Primary Frame Synchronizer block to NOT declare the OOF defect condition, due to M-bit Errors. 1 – Configures the Primary Frame Synchronizer block to declare the OOF defect condition anytime it determines that the M-bits within 3 out of 4 consecutive DS3 frames are in error. **NOTE:** This bit-field is ignored if the DS3/E3 Framer block has been configured to operate in the E3 Mode.

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Detection of CP Bit Error Interrupt Enable	R/W	**Detection of CP-Bit Error Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of CP-Bit Error" Interrupt, within the Channel. If the user enables this interrupt, then the Primary Frame Synchronizer block will generate an interrupt anytime it detects CP bit errors. 0 – Disables the "Detection of CP Bit Error" Interrupt. 1 – Enables the "Detection of CP-Bit Error" Interrupt. ***Note:*** *This bit-field is only active if the DS3/E3 Framer block has been configured to operate in the DS3, C-bit Parity Framing format.*
6	Change of LOS Defect Condition Interrupt Enable	R/W	**Change in LOS Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in LOS (Loss of Signal) Defect Condition" Interrupt, within the Channel. If the user enables this interrupt, then the Primary Frame Synchronizer block will generate an interrupt in response to either of the following conditions. • The instant that the Primary Frame Synchronizer block declares an LOS defect condition. • The instant that the Primary Frame Synchronizer block clears the LOS defect condition. 0 – Disables the "Change in LOS Defect Condition" Interrupt. 1 – Enables the "Change in LOS Defect Condition" Interrupt. **NOTE:** This configuration setting only applies to the Primary Frame Synchronizer block. This configuration setting does not apply to the Secondary Frame Synchronizer block.
5	Change of AIS Defect Condition Interrupt Enable	R/W	**Change in AIS Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in AIS (Alarm Indication Signal) Defect Condition" Interrupt, within the Channel. If the user enables this interrupt, then the Primary Frame Synchronizer block will generate an interrupt in response to either of the following conditions. • The instant that the Primary Frame Synchronizer block declares an AIS defect condition. • The instant that the Primary Frame Synchronizer block clears the AIS defect condition. 0 – Disables the "Change in AIS Defect Condition" Interrupt.

			1 – Enables the "Change in AIS Defect Condition" Interrupt. ***Note:*** *This bit-field is ignored if the Primary Frame Synchronizer block is by-passed.*
4	Change of DS3 Idle Condition Interrupt Enable	R/W	**Change in DS3 Idle Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in DS3 Idle Condition" Interrupt, within the Channel. If the user enables this interrupt, then the Primary Frame Synchronizer block will generate an interrupt in response to either of the following conditions. • The instant that the Primary Frame Synchronizer block declares the DS3 Idle condition. • The instant that the Primary Frame Synchronizer block clears the DS3 Idle condition. 0 – Disables the "Change in DS3 Idle Condition" Interrupt. 1 – Enables the "Change in DS3 Idle Condition" Interrupt. ***Note:*** *This bit-field is ignored if the Primary Frame Synchronizer block is by-passed.*
3	Change of FERF/RDI Defect Condition Interrupt Enable	R/W	**Change in FERF/RDI Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in FERF/RDI (Far-End Receive Failure/Remote Defect Indicator) Condition" Interrupt, within the Channel. If the user enables this interrupt, then the Primary Frame Synchronizer block will generate an interrupt in response to either of the following conditions. • The instant that the Primary Frame Synchronizer block declares the FERF/RDI defect condition. • The instant that the Primary Frame Synchronizer block clears the FERF/RDI defect condition. 0 – Disables the "Change in FERF/RDI Defect Condition" Interrupt. 1 – Enables the "Change in FERF/RDI Defect Condition" Interrupt. ***Note:*** *This bit-field is ignored if the Primary Frame Synchronizer block is by-passed.*
2	Change of AIC State Interrupt Enable	R/W	**Change in AIC State Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in AIC State" Interrupt, within the Channel. If the user enables this interrupt, then the Primary Frame Synchronizer block will generate an interrupt in response to it detecting a change in the AIC bit-field, within the incoming DS3 data stream. 0 – Disables the "Change in AIC State" Interrupt. 1 – Enables the "Change in AIC State" Interrupt. ***Note:*** *This bit-field is ignored if the Primary Frame Synchronizer block is by-passed.*
1	Change of OOF Defect Condition Interrupt Enable	R/W	**Change in OOF Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in OOF (Out of Frame) Defect Condition" Interrupt, within the Channel. If the user enables this interrupt, then the Primary Frame Synchronizer block will generate an interrupt in response to either of the following conditions. • The instant that the Primary Frame Synchronizer block declares the OOF defect condition.

			• The instant that the Primary Frame Synchronizer block clears the OOF defect condition. 0 – Disables the "Change in OOF Defect Condition" Interrupt. 1 – Enables the "Change in OOF Defect Condition" Interrupt. ***Note:*** *This bit-field is ignored if the Primary Frame Synchronizer block is by-passed.*
0	Detection of P-Bit Error Interrupt Enable	R/W	**Detection of P-Bit Error Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of P-Bit Error" Interrupt, within the Channel. If the user enables this interrupt, then the Primary Frame Synchronizer block will generate an interrupt anytime it detects P bit errors. 0 – Disables the "Detection of P Bit Error" Interrupt. 1 – Enables the "Detection of P-Bit Error" Interrupt. ***Note:*** *This bit-field is ignored if the Primary Frame Synchronizer block is by-passed.*

4	Change of DS3 Idle Condition Interrupt Status	RUR	**Change in DS3 Idle Condition Interrupt Status:** This RESET-upon-READ register indicates whether or not the "Change in DS3 Idle Condition" interrupt has occurred since the last read of this register. 0 – The "Change in DS3 Idle Condition" Interrupt has not occurred since the

			last read of this register. 1 – The "Change in DS3 Idle Condition" Interrupt has occurred since the last read of this register. ***Note:*** *This bit-field is ignored if the Primary Frame Synchronizer block is by-passed.*
3	Change of FERF/RDI Defect Condition Interrupt Status	RUR	**Change in FERF/RDI Defect Condition Interrupt Status:** This RESET-upon-READ register indicates whether or not the "Change in FERF/RDI Defect Condition" Interrupt has occurred since the last read of this register. 0 – The "Change in FERF/RDI Defect Condition" Interrupt has not occurred since the last read of this register. 1 – The "Change in FERF/RDI Defect Condition" Interrupt has occurred since the last read of this register. ***Note:*** *This bit-field is ignored if the Primary Frame Synchronizer block is by-passed.*
2	Change of AIC State Interrupt Status	RUR	**Change in AIC State Interrupt Status:** This RESET-upon-READ register bit indicates whether or not the "Change in AIC State" interrupt has occurred since the last read of this register. 0 – The "Change in AIC State" Interrupt has not occurred since the last read of this register. 1 – The "Change in AIC State" Interrupt has occurred since the last read of this register. ***Note:*** *This bit-field is ignored if the Primary Frame Synchronizer block is by-passed.*
1	Change of OOF Defect Condition Interrupt Status	RUR	**Change in OOF Defect Condition Interrupt Status:** This RESET-upon-READ register indicates whether or not the "Change in OOF Defect Condition" Interrupt has occurred since the last read of this register. 0 – The "Change in OOF Defect Condition" Interrupt has not occurred since the last read of this register. 1 – The "Change in OOF Defect Condition" Interrupt has occurred since the last read of this register. ***Note:*** *This bit-field is ignored if the Primary Frame Synchronizer block is by-passed.*
0	Detection of P-Bit Error Interrupt Status	RUR	**Detection of P-Bit Error Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of P-Bit Error" Interrupt has occurred since the last read of this register. 0 – The "Detection of P-Bit Error" Interrupt has not occurred since the last read of this register. 1 – The "Detection of P-Bit Error" Interrupt has occurred since the last read of this register. ***Note:*** *This bit-field is ignored if the Primary Frame Synchronizer block is by-passed.*

Table 301: RxDS3 Sync Detect Register (Address Location= 0xN314, where N ranges from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused					P-Bit Correct	F Algorithm	One and Only
R/O	R/O	R/O	R/O	R/O	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
2	P-Bit Correct	R/W	**P-Bit Correct:** This READ/WRITE bit-field permits the user to enable or disable the "P-Bit Correct" feature within the Primary Frame Synchronizer block. If the user enables this feature, then the Primary Frame Synchronizer block will automatically invert the state of any P-bits, whenever it detects "P-bit errors" within the incoming DS3 data-stream. 0 – Disables the "P-Bit Correct" feature. 1 – Enables the "P-Bit Correct" feature
1	F Algorithm	R/W	**F-Bit Search Algorithm Select:** This READ/WRITE bit-field permits the user to select the "F-bit acquisition" criteria that the Primary Frame Synchronizer block will use whenever it is operating in the "F-Bit Search" state, as depicted below. 0 – Configures the Primary Frame Synchronizer block will move on to the "M-Bit Search" state, whenever it has properly located 10 consecutive F-bits within the incoming DS3 data-stream. 1 – Primary Frame Synchronizer block will move on to the "M-Bit Search" state, when it has properly located 16 consecutive F-bits within the incoming DS3 data-stream. **NOTE:** This bit-field is only active if the user has configured the DS3/E3 Framer block to operate in the DS3 Mode.
0	One and Only	R/W	**F-Bit Search/Mimic-Handling Algorithm Select:** This READ/WRITE bit-field permits the user to select the "F-bit acquisition" criteria that the Primary Frame Synchronizer block will use whenever it is operating in the "F-Bit Search" state. 0 – Configures the Primary Frame Synchronizer block to move on to the "M-Bit Search" state, when it has properly located 10 (or 16) consecutive F-bits (as configured in Bit 1 of this register). 1 – Configures the Primary Frame Synchronizer block to move on to the "M-Bit Search" state, when (1) it has properly located 10 (or 16) consecutive F-bits; and (2) when it has located and identified only one viable "F-Bit Alignment" candidate. ***Note:*** *If this bit is set to "1", then the Primary Frame Synchronizer block will NOT transition into the "M-Bit Search" state, as long as at least two viable candidate set of bits appear to function as the F-bits.*

Table 302: RxDS3 FEAC Register (Address Location= 0xN316, where N ranges from 0x02 to 0x04)

0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 5	Unused	R/O	Please set to "0" (the default value) for normal operation.
4	FEAC Valid	R/O	**FEAC Message Validation Indicator:** This READ-ONLY bit-field indicates that the FEAC Code (which resides within the "RxDS3 FEAC" Register) has been validated by the Receive FEAC Controller block. The Receive FEAC Controller block will validate a FEAC codeword if it has received this codeword in 8 out of the last 10 FEAC Messages. Polled systems can monitor this bit-field, when checking for a newly validated FEAC codeword. 0 – FEAC Message is not (or no longer) validated. 1 – FEAC Message has been validated. **NOTE:** This bit-field is only active if the DS3/E3 Framer block has been configured to operate in the DS3, C-bit Parity Framing format.
3	RxFEAC Remove Interrupt Enable	R/W	**FEAC Message Remove Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Receive FEAC Remove Interrupt". If the user enables this interrupt, then the Primary Framer Synchronizer block will generate an interrupt anytime the most recently validated FEAC Message has been removed. The Receive FEAC Controller sub-block will remove a validated FEAC codeword, if it has received a different codeword in 3 out of the last 10 FEAC Messages. 0 – Receive FEAC Remove Interrupt is disabled. 1 – Receive FEAC Remove Interrupt is enabled. ***Note:*** *This bit-field is only active if the DS3/E3 Framer block has been configured to operate in the DS3, C-bit Parity Framing format. Further, this bit-field is ignored if the Primary Frame Synchronizer block is by-passed.*
2	RxFEAC Remove Interrupt Status	RUR	**FEAC Message Remove Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "FEAC Message Remove Interrupt" has occurred since the last read of this register. 0 – FEAC Message Remove Interrupt has NOT occurred since the last read of this register. 1 – FEAC Message Remove Interrupt has occurred since the last read of this register. NOTE: This bit-field is only active if the DS3/E3 Framer block has been configured to operate in the DS3, C-bit Parity Framing format.
1	RxFEAC Valid Interrupt	R/W	**FEAC Message Validation Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the

	Interrupt Enable		FEAC Message Validation Interrupt. If the user enables this interrupt, then the Primary Frame Synchronizer block will generate an interrupt anytime a new FEAC Codeword has been validated by the Receive FEAC Controller sub-block. 0 – FEAC Message Validation Interrupt is NOT enabled. 1 – FEAC Message Validation Interrupt is enabled. **NOTE:** This bit-field is only active if the DS3/E3 Framer block has been configured to operate in the DS3, C-bit Parity Framing format.
0	RxFEAC Valid Interrupt Status	RUR	**FEAC Message Validation Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "FEAC Message Validation" Interrupt has occurred since the last read of this register. 0 – FEAC Message Validation Interrupt has not occurred since the last read of this register. 1 – FEAC Message Validation Interrupt has occurred since the last read of this register. **NOTE:** This bit-field is only active if the DS3/E3 Framer block has been configured to operate in the DS3, C-bit Parity Framing format.

Table 304: RxDS3 LAPD Control Register (Address Location= 0xN318, where N ranges from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
RxLAPD Any	Unused				Receive LAPD Enable	Receive LAPD Interrupt Enable	Receive LAPD Interrupt Status
R/W	R/O	R/O	R/O	R/O	R/W	R/W	RUR
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	RxLAPD Any	R/W	**Receive LAPD – Any kind:** This READ/WRITE bit-field permits the user to configure the Receive LAPD Controller sub-block (within the Primary Frame Synchronizer block) to receive any kind of LAPD Message (or HDLC Message) with a size of 82 bytes or less. If the user implements this option, then the Receive LAPD Controller sub-block will be capable of receiving any kind of HDLC Message (with any value of header bytes). The only restriction is that the size of the HDLC Message must not exceed 82 bytes. 0 – Does not invoke this "Any Kind of HDLC Message" feature. In this case, the Receive LAPD Controller sub-block will only receive HDLC Messages that contains the Bellcore GR-499-CORE values for SAPI and TEI. Invokes this "Any Kind of HDLC Message" feature. In this case, the Receive LAPD Controller sub-block will be able to receive HDLC Messages that contain any header byte values. ***Note:*** *This bit-field is ignored if the Primary Frame Synchronizer block is by-passed.* *The user can determine the size (or byte-count) of the most recently received LAPD/PMDL Message, by reading the contents of the "RxLAPD Byte Count" Register (Address Location= 0xN384)*
6 – 3	Unused	R/O	
2	Receive LAPD Enable	R/W	**Receive LAPD Controller sub-block Enable:** This READ/WRITE bit-field permits the user to either enable or disable the Receive LAPD Controller sub-block within the Primary Frame Synchronizer block. If the user enables the Receive LAPD Controller sub-block, then it will immediately begin extracting out and monitoring the data (being carried via the "DL" bits) within the incoming DS3 data stream. 0 – Enables the Receive LAPD Controller sub-block. 1 – Disables the Receive LAPD Controller sub-block. ***Note:*** *This bit-field is ignored if the Primary Frame Synchronizer block is by-passed.*
1	Receive LAPD Interrupt Enable	R/W	**Receive LAPD Message Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Receive LAPD Message" Interrupt. If the user enables this interrupt, then the channel will generate an interrupt, anytime the Receive LAPD Controller sub-block receives a new PMDL Message. 0 – Disables the "Receive LAPD Message" Interrupt. 1 – Enables the "Receive LAPD Message" Interrupt.

			Note: *This bit-field is only active if the DS3/E3 Framer block has been configured to operate in the DS3, C-bit Parity Framing format. This bit-field is ignored if the Primary Frame Synchronizer block is by-passed.*
0	Receive LAPD Interrupt Status	RUR	**Receive LAPD Message Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Receive LAPD Message" Interrupt has occurred since the last read of this register. 0 – "Receive LAPD Message" Interrupt has NOT occurred since the last read of this register. 1 – "Receive LAPD Message" Interrupt has occurred since the last read of this register. ***Note:*** *This bit-field is only active if the DS3/E3 Framer block has been configured to operate in the DS3, C-bit Parity Framing format. This bit-field is ignored if the Primary Frame Synchronizer block is by-passed.*

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Unused	R/O	
6	RxABORT	R/O	**Receive ABORT Sequence Indicator:** This READ-ONLY bit-field indicates that the Receive LAPD Controller sub-block has received an ABORT sequence (e.g., a string of seven consecutive "0s"). 0 – Indicates that the Receive LAPD Controller sub-block has NOT received an ABORT sequence. 1 - Indicates that the Receive LAPD Controller sub-block has received an ABORT sequence. ***Note:*** *Once the Receive LAPD Controller sub-block receives an ABORT sequence, it will set this bit-field "high", until it receives another LAPD Messages.*
5 – 4	RxLAPDType[1:0]	R/O	**Receive LAPD Message Type Indicator:** These two READ-ONLY bits indicate the type of LAPD Message that is residing within the Receive LAPD Message buffer. The relationship between the content of these two bit-fields and the corresponding message type is presented below.
3	RxCR Type	R/O	**Received C/R Value:** This READ-ONLY bit-field indicates the value of the C/R bit (within one of the header bytes) of the most recently received LAPD Message. **NOTE:** This bit-field is only active if the DS3/E3 Framer block has been configured to operate in the DS3, C-bit Parity Framing format.
2	RxFCS Error	R/O	**Receive Frame Check Sequence (FCS) Error Indicator:** This READ-ONLY bit-field indicates whether or not the most recently received LAPD Message frame contained an FCS error. 0 – The most recently received LAPD Message frame does not contain an FCS error. 1 – The most recently received LAPD Message frame does contain an

RxLAPDType[1:0]		Message Type
0	0	CL Path Identification
0	1	Idle Signal Identification
1	0	Test Signal Identification
1	1	ITU-T Path Identification

			FCS error. **NOTE:** This bit-field is only active if the DS3/E3 Framer block has been configured to operate in the DS3, C-bit Parity Framing format.
1	End of Message	R/O	**End of Message Indicator** This READ-ONLY bit-field indicates whether or not the Receive LAPD Controller sub-block has received a complete LAPD Message, as described below. 0 – The Receive LAPD Controller sub-block is currently receiving a LAPD Message, but has not received the complete message. 1 – The Receive LAPD Controller sub-block has received a completed LAPD Message. ***Note:*** *Once the Receive LAPD Controller sub-block sets this bit-field "high", this bit-field will remain high, until the Receive LAPD Controller sub-block begins to receive a new LAPD Message.*
0	Flag Present	R/O	**Receive Flag Sequence Indicator:** This READ-ONLY bit-field indicates whether or not the Receive LAPD Controller sub-block is currently receiving the Flag Sequence (e.g., a continuous stream of 0x7E octets within the Data Link channel), as described below. 0 – Indicates that the Receive LAPD Controller sub-block is NOT currently receiving the Flag Sequence octet. 1 – Indicates that the Receive LAPD Controller sub-block is currently receiving the Flag Sequence octet.

Table 306: RxDS3 Pattern Register (Address Location= 0xN32F, where N ranges from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
DS3 AIS Unframed All Ones	DS3 AIS Non Stuck Stuff	Unused	Receive LOS Pattern	Receive DS3 Idle Pattern[3:0]			
R/W	R/W	R/O	R/W	R/W	R/W	R/W	R/W
0	0	0	0	1	1	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	DS3 AIS Unframed All Ones	R/W	**DS3 AIS - Unframed All Ones – AIS Pattern** This READ/WRITE bit-field, (along with the "Non-Stuck-Stuff" bit) permits the user specify the "AIS Declaration" criteria for the Primary Frame Synchronizer block, as described below. 0 – Configures the Primary Frame Synchronizer block to declare the AIS defect condition, when receiving a DS3 signal carrying a "framed 1010.." pattern. 1 – Configures the Primary Frame Synchronizer block to declare the AIS defect condition, when receiving either an unframed, All Ones pattern or a "framed 1010.." pattern.
6	DS3 AIS Non-Stuck Stuff	R/W	**DS3 AIS - Non-Stuck-Stuff Option – AIS Pattern** This READ/WRITE bit-field (along with the "Unframed All Ones – AIS Pattern bit-field) permits the user to define the "AIS Defect Declaration" criteria for the Primary Frame Synchronizer block, as described below. 0 – Configures the Primary Frame Synchronizer block to require that all "C" bits are set to "0" before it will declare the AIS defect condition. 1 – Configures the Primary Frame Synchronizer block to NOT require that all "C" bits are set to "0" before it will declare the AIS defect condition. In this mode, no attention will be paid to the state of the "C" bits within the incoming DS3 data-stream.
5	Unused	R/O	
4	Receive LOS Pattern	R/W	**Receive LOS Pattern:** This READ/WRITE bit-field permits the user to define the "LOS Defect Declaration" criteria for the Primary Frame Synchronizer block, as described below. 0 – Configures the Primary Frame Synchronizer block to declare the LOS defect condition if it receives a string of a specific length of consecutive zeros. 1 – Configures the Primary Frame Synchronizer block to declare the LOS defect condition if it receives a string (of a specific length) of consecutive ones. **NOTE:** This bit-field is only enabled if the "Internal LOS Enable" feature has been enabled within the Primary Frame Synchronizer block.
3 – 0	Receive DS3 Idle Pattern[3:0]	R/W	**Receive DS3 Idle Pattern:** These READ/WRITE bit-fields permit the user to specify the pattern in which the Primary Frame Synchronizer will recognize as the "DS3 Idle Pattern". ***Note:*** *The Bellcore GR-499-CORE specified value for the Idle Pattern is a framed repeating "1, 1, 0, 0…" pattern. Therefore, if the user wishes to configure the "Primary Frame Synchronizer" to declare*

			an "Idle Pattern" when it receives this pattern, then he/she write the value [1100] into these bit-fields.

1.10.3 RECEIVE E3, ITU-T G.751 RELATED REGISTERS

Table 307: RxE3 Configuration and Status Register # 1 - G.751 (Address Location= 0xN310, where N ranges from 0x02 to 0x04)

7 - 4	Unused	R/O	Please set to "0" (the default value) for normal operation
3	Change in FERF/RDI Defect Condition Interrupt Enable	R/W	**Change in FERF/RDI Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in FERF/RDI Defect Condition" Interrupt. If the user enables this interrupt, then the Primary Frame Synchronizer block will generate an interrupt in response to either of the following events. • Whenever the Primary Frame Synchronizer block declares the FERF/RDI Defect condition. • Whenever the Primary Frame Synchronizer block clears the FERF/RDI Defect condition. The user can enable or disable this particular interrupt as described below. 0 – Disables the "Change in FERF/RDI Defect Condition" Interrupt. 1 – Enables the "Change in FERF/RDI Defect Condition" Interrupt. ***Note:*** *This bit-field is ignored if the Primary Frame Synchronizer block is configured to verify BIP-4 values within each incoming E3 frame. Further, this bit-field is ignored anytime the Primary Frame Synchronizer block is by-passed.*
2	Detection of BIP-4 Error Interrupt Enable	R/W	**Detection of BIP-4 Error Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of BIP-4 Error" Interrupt. If the user enables this interrupt, then the Primary Frame Synchronizer block will generate an interrupt anytime it detects a BIP-4 error, within the incoming E3 data stream. The user can enable or disable this interrupt as described below. 0 – Disables the "Detection of BIP-4 Error" Interrupt. 1 – Enables the "Detection of BIP-4 Error" Interrupt. ***Note:*** *This bit-field is only active if the Receive E3 Framer block has been configured to compute and verify the BIP-4 values within each incoming E3 frame. This bit-field is ignored anytime the Primary Frame Synchronizer block is by-passed.*
1	Detection of FAS Bit Error Interrupt Enable	R/W	**Detection of FAS (Framing Alignment Signal) Bit Error Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "FAS Bit Error" Interrupt. If the user enables this interrupt, then the Primary Frame Synchronizer block will generate an interrupt anytime it detects an FAS error within the incoming E3 data stream.

			0 – Disables the “Detection of FAS Bit Error” Interrupt. 1 – Enables the “Detection of FAS Bit Error” Interrrupt. ***Note:*** *This bit-field is ignored if the Primary Frame Synchronizer block is by-passed.*
0	Unused	R/O	Please set to “0” (the default value) for normal operation.

Table 313: RxE3 LAPD Control Register – G.751 (Address Location= 0xN318, where N ranges from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
RxLAPD Any	Message Check Disable	Unused			Receive LAPD Enable	Receive LAPD Interrupt Enable	Receive LAPD Interrupt Status
R/W	R/W	R/O	R/O	R/O	R/W	R/W	RUR
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	RxLAPD Any	R/W	**Receive LAPD – Any kind:** This READ/WRITE bit-field permits the user to configure the Receive LAPD Controller sub-block to receive any kind of LAPD Message (or HDLC Message) with a size of 82 bytes or less. If the user implements this option, then the Receive LAPD Controller sub-block will be capable of receiving any kind of HDLC Message (with any value of header bytes). The only restriction is that the size of the HDLC Message must not exceed 82 bytes. 0 – Does not invoke this "Any Kind of HDLC Message" feature. In this case, the Receive LAPD Controller sub-block will only receive HDLC Messages that contains the Bellcore GR-499-CORE values for SAPI and TEI. 1 - Invokes this "Any Kind of HDLC Message" feature. In this case, the Receive LAPD Controller sub-block will be able to receive HDLC Messages that contain any header byte values. ***Note:*** *This bit-field is ignored if the Primary Frame Synchronizer block is by-passed.* *The user can determine the size (or byte count) of the most recently received LAPD/PMDL Message, by reading the contents of the "Receive LAPD Byte Count" Register (Address Location= 0xN384).*
6	Message Check Disable	R/W	**Message Check Disable:** This READ/WRITE bit-field permits the user to either enable or disable the new message comparison logic. If the user disables the new message comparison logic, then every message received would generate an interrupt. 0 – Enables the new message comparison logic 1 – Disables the new message comparison logic
5 – 3	Unused	R/O	
2	Receive LAPD Enable	R/W	**Receive LAPD Controller Sub-Block Enable:** This READ/WRITE bit-field permits the user to either enable or disable the Receive LAPD Controller sub-block within the channel. If the user enables the Receive LAPD Controller sub-block, then it will immediately begin extracting out and monitoring the data (being carried via the "N" bits) within the incoming E3 data stream. 0 – Enables the Receive LAPD Controller sub-block. 1 – Disables the Receive LAPD Controller sub-block. ***Note:*** *This bit-field is ignored if the Primary Frame Synchronizer block is by-passed.*
1	Receive LAPD Interrupt	R/W	**Receive LAPD Message Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the

	Enable		"Receive LAPD Message" Interrupt. If the user enables this interrupt, then the channel will generate an interrupt, anytime the Receive LAPD Controller sub-block receives a new PMDL Message. 0 – Disables the "Receive LAPD Message" Interrupt. 1 – Enables the "Receive LAPD Message" Interrupt. ***Note:*** *This bit-field is ignored if the Primary Frame Synchronizer block is by-passed.*
0	Receive LAPD Interrupt Status	RUR	**Receive LAPD Message Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Receive LAPD Message" Interrupt has occurred since the last read of this register. 0 – "Receive LAPD Message" Interrupt has NOT occurred since the last read of this register. 1 – "Receive LAPD Message" Interrupt has occurred since the last read of this register. ***Note:*** *This bit-field is ignored if the Primary Frame Synchronizer block is by-passed.*

5	Unused	R/W	
4	Detection of FEBE Event Interrupt Enable	R/W	**Detection of FEBE Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of FEBE" Interrupt, as indicated below. 0 – Disables the "Detection of FEBE" Interrupt. 1 – Enables the "Detection of FEBE" Interrupt. In this mode, the Primary Frame Synchronizer block will generate an interrupt anytime it detects a FEBE (Far-End Block Error) indicator in the incoming E3 data-stream.
3	Change in FERF/RDI Defect Condition Interrupt Enable	R/W	**Change in FERF Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the Change in FERF/RDI Defect Condition Interrupt, as indicated below. 0 – Disables the "Change in FERF/RDI Defect Condition" Interrupt. 1 – Enables the "Change in FERF/RDI Defect Condition" Interrupt. In this mode, the Primary Frame Synchronizer block will generate an interrupt, in response to either of the following conditions. • Whenever the Primary Frame Synchronizer block declares the FERF/RDI Defect condition. • Whenever the Primary Frame Synchronizer block clears the FERF/RDI defect condition.
2	Detection of BIP-8 Error Interrupt Enable	R/W	**Detection of BIP-8 Error Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of BIP-8 Error" Interrupt, as indicated below.

			0 – Disables the "Detection of BIP-8 Error" Interrupt. 1 – Enables the "Detection of BIP-8 Error" Interrupt. In this mode, the Primary Frame Synchronizer block will generate an interrupt anytime it detects a BIP-8 error in the incoming E3 data-stream.
1	Detection of Framing Byte Error Interrupt Enable	R/W	**Detection of Framing Byte Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of Framing Byte Error" Interrupt, as indicated below. 0 – Disables the "Detection of Framing Byte Error" Interrupt. 1 – Enables the "Detection of Framing Byte Error" Interrupt. In this mode, the Primary Frame Synchronizer block will generate an interrupt anytime it detects a FA1 or FA2 byte error in the incoming E3 data stream.
0	RxPLD Mis Interrupt Enable		**Received Payload Type Mismatch Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Receive Payload Type Mismatch" interrupt, as indicated below. 0 – Disables the "Received Payload Type Mismatch" Interrupt. 1 – Enables the "Received Payload Type Mismatch" Interrupt. In this mode, the Primary Frame Synchronizer block will generate an interrupt anytime it receives a "Payload Type" value (within the MA byte) that differs from that written into the "RxPLDExp[2:0]" bit-fields.

6	Change in SSM MSG Interrupt Status	RUR	**Change in SSM (Synchronization Status Message) Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in SSM Message" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Primary Frame Synchronizer block will generate an interrupt, anytime it detects a change in the "SSM[3:0]" value that it has received via the incoming E3 data-stream. 0 – Indicates that the "Change in SSM Message" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change in SSM Message" Interrupt has occurred since the last read of this register. ***Note:*** *The user can obtain the newly received value for "SSM" by reading out the contents of Bits 3 through 1 (RxSSM[3:0]) within the "RxE3 SSM Register – G.832" (Address Location= 0xN32C).*
5	Change in SSM OOS State Interrupt Status	RUR	**Change in SSM OOS (Out of Sequence) State Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in SSM OOS State" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Primary Frame Synchronizer block will generate the "Change in SSM OOS State" Interrupt will response to the following events. • Whenever the Primary Frame Synchronizer block declares the SSM OOS Condition. • Whenever the Primary Frame Synchronizer block clears the SSM OOS condition. 0 – Indicates that the "Change in SSM OOS Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change in SSM OOS Condition" Interrupt has occurred since the last read of this register.
4	COFA Interrupt Status	RUR	**COFA Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "COFA" (Change of Framing Alignment) Interrupt has occurred

			since the last read of this register. If this interrupt is enabled, then the Primary Frame Synchronizer block will generate an interrupt anytime it detects a new "Framing Alignment" with the incoming E3 data-stream. 0 – Indicates that the "COFA Interrupt" has not occurred since the last of this register. 1 – Indicates that the "COFA Interrupt" has occurred since the last read of this register.
3	Change in OOF Defect Condition Interrupt Status	RUR	**Change in OOF (Out of Frame) Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in OOF Defect Condition" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Primary Frame Synchronizer block will generate the "Change in OOF Defect Condition" Interrupt in response to the following events. • Whenever the Primary Frame Synchronizer block declares the "OOF Condition". • Whenever the Primary Frame Synchronizer block clears the "OOF Condition". 0 – Indicates that the "Change in OOF Defect Condition Interrupt" has not occurred since the last of this register. 1 – Indicates that the "Change in OOF Defect Condition Interrupt" has occurred since the last read of this register. ***Note:*** *The user can determine the current state of the "AIS Condition" by reading out the contents of Bit 5 (OOF Defect Declared) within the "RxE3 Configuration and Status Register # 2 – G.832" (Address Location= 0xN311).*
2	Change in LOF Defect Condition Interrupt Status	RUR	**Change in LOF (Loss of Frame) Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in LOF Defect Condition Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Primary Frame Synchronizer block will generate the "Change in LOF Defect Condition" Interrupt will occur in response to the following events. • Whenever the Primary Frame Synchronizer block declares the "LOF Defect Condition". • When the Primary Frame Synchronizer block clears the "LOF Defect Condition". 0 – Indicates that the "Change in LOF Defect Condition Interrupt" has not occurred since the last of this register. 1 – Indicates that the "Change in LOF Defect Condition Interrupt" has occurred since the last read of this register. ***Note:*** *The user can determine the current state of the "LOF Condition" by reading out the contents of Bit 6 (LOF Defect Declared) within the "RxE3 Configuration and Status Register # 2 – G.832" (Address Location= 0xN311).*
1	Change in LOS Defect	RUR	**Change in LOS (Loss of Signal) Defect Condition Interrupt**

	Condition Interrupt Status		**Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in LOS Defect Condition" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Primary Frame Synchronizer block will generate the "Change in LOS Defect Condition" Interrupt will occur in response to the following events. • Whenever the Primary Frame Synchronizer block declares the "LOS Defect Condition". • When the Primary Frame Synchronizer block clears the "LOS Defect Condition". 0 – Indicates that the "Change in LOS Defect Condition Interrupt" has not occurred since the last of this register. 1 – Indicates that the "Change in LOS Defect Condition Interrupt" has occurred since the last read of this register. ***Note:*** *The user can determine the current state of the "LOS Condition" by reading out the contents of Bit 4 (LOS Defect Declared) within the "RxE3 Configuration and Status Register # 2 – G.832" (Address Location= 0xN311).*
0	Change in AIS Defect Condiiton Interrupt Status	RUR	**Change in AIS Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in AIS Defect Condition" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Primary Frame Synchronizer block will generate the "Change in AIS Defect Condition" Interrupt will occur in response to the following events. • Whenever the Primary Frame Synchronizer block declares the "AIS Condition". • Whenever the Primary Frame Synchronizer block clears the "AIS Condition". 0 – Indicates that the "Change in AIS Defect Condition Interrupt" has not occurred since the last of this register. 1 – Indicates that the "Change in AIS Defect Condition Interrupt" has occurred since the last read of this register. ***Note:*** *The user can determine the current state of the "AIS Condition" by reading out the contents of Bit 3 (AIS Defect Declared) within the "RxE3 Configuration and Status Register # 2 – G.832" (Address Location= 0xN311).*

If this interrupt is enabled, then the Primary Frame Synchronizer block will generate an interrupt anytime it receives a Trail-Trace Message, that is different from that of the previously received message. 0 – Indicates that the "Change in Receive Trail-Trace Message" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change in Receive Trail-Trace Message" Interrupt has occurred since the last read of this register. ***Note:*** *The user can obtain the value of the most recently received Trail-Trace Message by reading out the contents of the "RxE3 Trail-Trace Message Byte-0" through "RxE3 Trail-Trace Message Byte-15" registers (Address Location= 0xN31C through 0xN32B).*
5	Unused	R/O	
4	Detection of FEBE/REI Event Interrupt Status	RUR	**Detection of FEBE/REI Event Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of FEBE/REI Event" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Primary Frame Synchronizer block will generate an interrupt anytime is detects a FEBE/REI event in the incoming E3 data-stream. 0 – Indicates that the "Detection of FEBE/REI Event" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of FEBE/REI Event" Interrupt has occurred since the last read of this register.
3	Change in FERF/RDI Defect Condition Interrupt Status	RUR	**Change in FERF/RDI (Far-End Receive Failure) Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in FERF/RDI Defect Condition" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Primary Frame Synchronizer block

			will generate an interrupt in response to the following events. • Whenever the Primary Frame Synchronizer block declares the FERF/RDI defect condition. • Whenever the Primary Frame Synchronizer block clears the FERF/RDI condition. 0 – Indicates that the "Change in FERF/RDI Defect Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change in FERF/RDI Defect Condition" Interrupt has occurred since the last read of the register. ***Note:*** *The user can obtain the state of the FERF/RDI defect condition, by reading out the contents of Bit 0 (FERF/RDI Defect Declared) within the "RxE3 Configuration and Status Register # 2 – G.832" (Address Location= 0xN311).*
2	Detection of BIP-8 Error Interrupt Status	RUR	**Detection of BIP-8 Error Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of BIP-8 Error" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Primary Frame Synchronizer block will generate an interrupt anytime is detects a BIP-8 Error in the incoming E3 data-stream. 0 – Indicates that the "Detection of BIP-8 Error" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of BIP-8 Error" Interrupt has occurred since the last read of this register.
1	Detection of Framing Byte Error Interrupt Status	RUR	**Detection of Framing Byte Error Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of Framing Byte Error" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Primary Frame Synchronizer block will generate an interrupt anytime is detects an error in either the FA1 or FA2 byte, within the incoming E3 data-stream. 0 – Indicates that the "Detection of Framing Byte Error" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of Framing Byte Error" Interrupt has occurred since the last read of this register.
0	Detection of PLD Type Mismatch Interrupt Status	RUR	**Detection of Payload Type Mismatch Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of Payload Type Mismatch" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Primary Frame Synchronizer block will generate an interrupt anytime it receives an E3 data-stream that contains a "RxPLDType[2:0]" that is different from the "RxPLDTypeExp[2:0]" value. 0 – Indicates that the "Detection of Payload Type Mismatch" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of Payload Type Mismatch" Interrupt has occurred since the last read of this register. ***Note:*** *The user can obtain the contents of the most recently received Payload Type by reading out the contents of Bits 7 through 5 (RxPLDType[2:0]) within the "RxE3 Configuration and Status*

			Register # 1 – G.832" (Address Location= 0xN310).

Table 322: RxE3 LAPD Control Register – G.832 (Address Location= 0xN318, where N ranges from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
RxLAPD Any	Message Check Disable	Unused		Receive LAPD from NR Byte	Receive LAPD Enable	Receive LAPD Interrupt Enable	Receive LAPD Interrupt Status
R/W	R/W	R/O	R/O	R/W	R/W	R/W	RUR
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	RxLAPD Any	R/W	**Receive LAPD – Any kind:** This READ/WRITE bit-field permits the user to configure the Receive LAPD Controller sub-block (within the Primary Frame Synchronizer block) to receive any kind of LAPD Message (or HDLC Message) with a size of 82 bytes or less. If the user implements this option, then the Receive LAPD Controller sub-block will be capable of receiving any kind of HDLC Message (with any value of header bytes). The only restriction is that the size of the HDLC Message must not exceed 82 bytes. 0 – Does not invoke this "Any Kind of HDLC Message" feature. In this case, the Receive LAPD Controller sub-block will only receive HDLC Messages that contains the Bellcore GR-499-CORE values for SAPI and TEI. 1-Invokes this "Any Kind of HDLC Message" feature. In this case, the Receive LAPD Controller sub-block will be able to receive HDLC Messages that contain any header byte values. ***Note:*** *This bit-field is ignored if the Primary Frame Synchronizer block is by-passed.* *The user can determine the size (or byte count) fo the most recently received LAPD/PMDL Message, by reading the contents of the "RxLAPD Byte Count" Register (Address Location= 0xN384).*
6	Message Check Disable	R/W	**Message Check Disable:** This READ/WRITE bit-field permits the user to either enable or disable the new message comparison logic. If the user disables the new message comparison logic, then every message received would generate an interrupt. 0 – Enables the new message comparison logic 1 – Disables the new message comparison logic
6 – 4	Unused	R/O	
3	Receive LAPD from NR Byte	R/W	**Receive LAPD Message from NR Byte Select:** This READ/WRITE bit-field permits the user to configure the Receive LAPD Controller sub-block to extract out the PMDL data from the NR or GC byte, within the incoming E3 data stream. 0 – Configures the Receive LAPD Controlller sub-block to extract PMDL information from the GC byte, within the incoming E3 data stream. 1 – Configures the Receive LAPD Controller sub-block to extract PMDL information from the NR byte, within the incoming E3 data stream. ***Note:*** *This bit-field is ignored if the Primary Frame Synchronizer block is by-passed.*

2	Receive LAPD Enable	R/W	**Receive LAPD Controller Block Enable:** This READ/WRITE bit-field permits the user to either enable or disable the Receive LAPD Controller sub-block (within the Primary Frame Synchronizer block). If the user enables the Receive LAPD Controller sub-block, then it will immediately begin extracting out and monitoring the data that is being carried by either the NR or GC bytes (depending upon user configuration) within the incoming E3 data stream. 0 – Disables the Receive LAPD Controller sub-block. 1 – Enables the Receive LAPD Controller sub-block. ***Note:*** *This bit-field is ignored if the Primary Frame Synchronizer block is by-passed.*
1	Receive LAPD Interrupt Enable	R/W	**Receive LAPD Message Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Receive LAPD Message" Interrupt. If the user enables this interrupt, then the Receive LAPD Controller sub-block (within the Primary Frame Synchronizer block) will generate an interrupt, anytime the Receive LAPD Controller sub-block receives a new LAPD/PMDL Message. 0 – Disables the "Receive LAPD Message" Interrupt. 1 – Enables the "Receive LAPD Message" Interrupt. ***Note:*** *This bit-field is ignored if the Receive LAPD Controller sub-block is disabled.*
0	Receive LAPD Interrupt Status	RUR	**Receive LAPD Message Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Receive LAPD Message" Interrupt has occurred since the last read of this register. 0 – Indicates that the "Receive LAPD Message" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Receive LAPD Message" Interrupt has occurred since the last read of this register. ***Note:*** *This bit-field is ignored if the Receive LAPD Controller sub-block is disabled.*

7	Unused	R/O	
6	RxABORT	R/O	**Receive ABORT Sequence Indicator:** This READ-ONLY bit-field indicates whether or not the most recently received LAPD/PMDL Message was interrupted by an ABORT sequence (e.g., a string of seven consecutive "1s") as described below. 0 – Indicates that the Receive LAPD Controller sub-block has NOT received an ABORT sequence within the most recently LAPD/PMDL Message. 1 - Indicates that the Receive LAPD Controller sub-block has received an ABORT sequence within the most recently received LAPD/PMDL Message. ***Note:*** *Once the Receive LAPD Controller sub-block receives an ABORT sequence, it will set this bit-field "high", until it receives another LAPD Message.*
5 – 4	RxLAPDType[1:0]	R/O	**Receive LAPD Message Type Indicator[1:0]:** These two READ-ONLY bits indicate the type of LAPD Message that is residing within the Receive LAPD Message buffer. The relationship between the content of these two bit-fields and the corresponding message type is presented below.
3	RxCR Type	R/O	**Received C/R Value:** This READ-ONLY bit-field indicates the value of the C/R bit (within one of the header bytes) of the most recently received LAPD Message.
2	RxFCS Error	R/O	**Receive Frame Check Sequence (FCS) Error Indicator:** This READ-ONLY bit-field indicates whether or not the most recently received LAPD Message frame contained an FCS error as described below. 0 – Indicates that the most recently received LAPD Message frame does not contain an FCS error. 1 – Indicates that the most recently received LAPD Message frame

RxLAPDType[1:0]		Message Type
0	0	CL Path Identification
0	1	Idle Signal Identification
1	0	Test Signal Identification
1	1	ITU-T Path Identification

			does contain an FCS error.
1	End of Message	R/O	**End of Message Indicator** This READ-ONLY bit-field indicates whether or not the Receive LAPD Controller sub-block has received a complete LAPD Message as described below. 0 – Indicates that the Receive LAPD Controller sub-block is currently receiving a LAPD Message, but has not received the complete message. 1 – Indicates that the Receive LAPD Controller sub-block has received a completed LAPD Message. ***Note:*** *Once the Receive LAPD Controller sub-block sets this bit-field "high", this bit-field will remain high, until the Receive LAPD Controller sub-block begins to receive a new LAPD Message.*
0	Flag Present	R/O	**Receive Flag Sequence Indicator:** This READ-ONLY bit-field indicates whether or not the Receive LAPD Controller sub-block is currently receiving the Flag Sequence (e.g., a continuous stream of 0x7E octets within the Data Link channel). 0 – Indicates that the Receive LAPD Controller sub-block is NOT currently receiving the Flag Sequence octet. 1 – Indicates that the Receive LAPD Controller sub-block is currently receiving the Flag Sequence octet.

1.10.5 DS3/E3 FRAME GENERATOR BLOCK RELATED REGISTERS – DS3 APPLICATIONS

Table 343: TxDS3 Configuration Register (Address Location= 0xN330, where N ranges from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Force TxFERF/ RDI	Tx X-Bits	TxIdle	TxAIS	TxLOS	TxFERF/RDI upon LOS	TxFERF/RDI upon OOF	TxFERF/RDI upon AIS
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Force TxFERF/RDI	R/W	**Force Transmit Yellow Alarm (FERF/RDI) indicator:** This READ/WRITE bit-field permits the user to force the Frame Generator block to transmit the FERF/RDI indicator to the remote terminal equipment by setting both of the X-bits (within each outbound DS3 frame) to "0". 0 – Does not force the DS3/E3 Frame Generator block to transmit the FERF/RDI indicator. In this case, the DS3/E3 Frame Generator block will set the "X" bits (within each outbound DS3 frame) to the appropriate value, depending upon receive conditions (as detected by the Primary Frame Synchronizer block). 1 – Forces the DS3/E3 Frame Generator block to transmit the FERF/RDI indicator. In this case, the DS3/E3 Frame Generator block will force the "X" bits (within each outbound DS3 frame) to "0". Thereby transmitting the FERF/RDI indicator to the remote terminal equipment. **NOTE:** For normal operation, (e.g., where the DS3/E3 Frame Generator block will automatically transmit the FERF/RDI indicator whenever the Primary Frame Synchronizer block declares either the LOS, AIS or LOF/OOF defect condition), the user MUST set this bit-field to "0"
6	Tx X-Bits	R/W	**Force X bits to "1":** This READ/WRITE bit-field permits the user to force the DS3/E3 Frame Generator block to set the X-bits (within each outbound DS3 frame) to "1". 0 – Configures the DS3/E3 Frame Generator block to automatically set the "X" bits to the appropriate value, depending upon the receive conditions (as detected by the corresponding Primary Frame Synchronizer block). 1 – Configures the DS3/E3 Frame Generator block to force all of the "X" bits (within the outbound DS3 data-stream) to "1". In this configuration setting, the DS3/E3 Frame Generator block will set all "X" bits to "1" independent of whether the corresponding Primary Frame Synchronizer block is currently declaring any defect conditions. **NOTE:** For normal operation (e.g., where the DS3/E3 Frame Generator block will automatically transmit the FERF/RDI indicator whenever the Primary Frame Synchronizer block declares the LOS, AIS or LOF/OOF defect condition) the user MUST set this bit-field to "0".
5	TxIdle	R/W	**Transmit DS3 Idle Signal:** This READ/WRITE bit-field permits the user to force the DS3/E3 Frame Generator block to transmit the DS3 Idle signal pattern to the remote terminal equipment, as described below. 0 – Configures the DS3/E3 Frame Generator block to transmit normal traffic to the remote terminal equipment.

			1 – Configures the DS3 Frame Generator block transmits the DS3 Idle Pattern to the remote terminal equipment. ***Note:*** *This bit-field is ignored if "TxAIS" or "TxLOS" bit-fields are set to "1".* *The exact pattern that the Frame Generator transmits (whenever this bit-field is set to "1") depends upon the contents within Bits 3 through 0 (Tx_Idle_Pattern[3:0]) within the "Transmit DS3 Pattern" Register (Address Location= 0xN34C).*
4	TxAIS	R/W	**Transmit AIS Pattern:** This READ/WRITE bit-field permits the user to force the DS3/E3 Frame Generator block to transmit the AIS indicator to the remote terminal equipment as described below. 0 – Configures the DS3/E3 Frame Generator block to transmit normal traffic to the remote terminal equipment. 1 – Configures the DS3/E3 Frame Generator block to transmit the DS3 AIS indicator to the remote terminal equipment. ***Note:*** *This bit-field is ignored if the "TxLOS" bit-field is set to "1".* *When this bit-field is set to "1", it will transmit either a "Framed, repeating 1, 0, 1, 0, …" pattern, or an "Unframed, All-Ones" pattern, depending upon the state of Bit 7 (TxAIS Unframed All Ones), within the "Transmit DS3 Pattern Register (Address Location= 0xN34C).*
3	TxLOS	R/W	**Transmit LOS Pattern:** This READ/WRITE bit-field permits the user to force the DS3/E3 Frame Generator block to transmit the LOS signal pattern to the remote terminal equipment as described below. 0 – Configures the DS3/E3 Frame Generator block to transmit normal traffic to the remote terminal equipment. 1 – Configures the DS3/E3 Frame Generator block to transmit the LOS Pattern (e.g., All Zeros or an All Ones, depending upon user configuration). ***Note:*** *This bit-field is ignored if "TxAIS" or "TxLOS" are set to "1".* *When this bit-field is set to "1", it will transmit either an "All Zeros" pattern, or an "All Ones" pattern; depending upon the state of Bit 4 (TxLOS Pattern) within the "Transmit DS3 Pattern Register (Address Location=0xN34C).*
2	TxFERF/RDI upon LOS	R/W	**Transmit FERF/RDI upon Declaration of the LOS defect condition:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to automatically transmit the FERF/RDI indicator, anytime (and for the duration that) the corresponding Primary Frame Synchronizer block declares the LOS defect condition. 0 – The DS3/E3 Frame Generator block will NOT automatically transmit the FERF/RDI indicator, whenever (and for the duration that) the Primary Frame Synchronizer block declares the LOS defect condition. 1 – The DS3/E3 Frame Generator block will automatically transmit the FERF/RDI indicator whenever (and for the duration that) the Primary Frame Synchronizer block declares LOS defect condition.
1	TxFERF/RDI upon OOF	R/W	**Transmit FERF/RDI upon Declaration of the OOF defect condition:** This READ/WRITE bit-field permits the user to configure the DS3 Frame Generator block to automatically transmit the FERF/RDI indicator, anytime (and for the duration that) the DS3/E3 Frame Synchronizer block declares the OOF defect condition, as described below. 0 – The DS3/E3 Frame Generator block will NOT automatically transmit the FERF/RDI indicator, whenever (and for the duration that) the Primary Frame

			Synchronizer block declares the OOF defect condition. 1 – The DS3/E3 Frame Generator block will automatically transmit the FERF/RDI indicator whenever (and for the duration that) the Primary Frame Synchronizer block declares the OOF defect condition.
0	TxFERF/RDI upon AIS	R/W	**Transmit FERF/RDI upon Declaration of the AIS defect condition:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to automatically transmit the FERF/RDI indicator, anytime (and for the duration that) the Primary Frame Synchronizer block declares the AIS defect condition, as described below. 0 – The DS3/E3 Frame Generator block will NOT automatically transmit the FERF/RDI indicator, whenever (and for the duration that) the Primary Frame Synchronizer block declares the AIS defect condition. 1 – The DS3/E3 Frame Generator block will automatically transmit the FERF/RDI indicator, whenever (and for the duration that) the Primary Frame Synchronizer block declares the AIS defect condition.

Table 344: TxDS3 FEAC Configuration and Status Register (Address Location= 0xN331, where N ranges from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused			TxFEAC Interrupt Enable	TxFEAC Interrupt Status	TxFEAC Enable	TxFEAC Go	TxFEAC Busy

0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 5	Unused	R/O	Please set to "0" for normal operation.
4	TxFEAC Interrupt Enable	R/W	**Transmit FEAC Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Transmit FEAC" Interrupt. If the user enables this interrupt, then the DS3/E3 Frame Generator block will generate an interrupt, once the Transmit FEAC Controller sub-block has completed its 10th transmission of a given FEAC Message to the remote terminal equipment. 0 – Disables the Transmit FEAC Interrupt. In this configuration setting, the DS3/E3 Frame Generator block will NOT generate an interrupt after the Transmit FEAC Controller sub-block has completed its 10th transmission of a given FEAC Message. 1 – Enables the Transmit FEAC Interrupt In this configuration setting, the DS3/E3 Frame Generator block will generate an interrupt after the Transmit FEAC Controller sub-block has completed its 10th transmission of a given FEAC Message. **NOTE:** This bit-field is only active if Bit 2 (TxFEAC Enable) within this register is set to "1".
3	TxFEAC Interrupt Status	RUR	**Transmit FEAC Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Transmit FEAC Interrupt" has occurred since the last read of this register, as described below. 0 – Indicates that the Transmit FEAC Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the Transmit FEAC Interrupt has occurred since the last read of this register. **NOTE:** This bit-field is only active if Bit 2 (TxFEAC Enable) within this register is set to "1".
2	TxFEAC Enable	R/W	**Transmit FEAC Controller Sub-block Enable:** This READ/WRITE bit-field permits the user to either enable or disable the Transmit FEAC Controller sub-block, within the DS3/E3 Frame Generator block, as described below. 0 – Disables the Transmit FEAC Controller sub-block. 1 – Enables the Transmit FEAC Controller sub-block.
1	TxFEAC Go	R/W	**Transmit FEAC Message Command:** A "0" to "1" transition, within this bit-field configures the Transmit FEAC Controller sub-block to begin its transmission of the FEAC Message (which consists of the FEAC code, as specified within the "TxDS3 FEAC" Register).

			Note: *The user is advised to perform a write operation that resets this bit-field back to "0", following execution of the command to transmit a FEAC Message.*
0	TxFEAC Busy	R/O	**Transmit FEAC Controller BUSY Indicator:** This READ-ONLY bit-field indicates whether or not the Transmit FEAC Controller sub-block is currently busy transmitting a FEAC Message to the remote terminal. 0 – Transmit FEAC Controller sub-block is NOT busy. 1 – Transmit FEAC Controller sub-block is currently transmitting the FEAC Message to the remote terminal.

Table 345: TxDS3 FEAC Register (Address Location= 0xN332, where N ranges from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused	TxFEACCode[5:0]						Unused
R/O	R/W	R/W	R/W	R/W	R/W	R/W	R/O
0	1	1	1	1	1	1	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Unused	R/O	
6 - 1	TxFEACCode[5:0]	R/W	**Transmit FEAC Code Word[5:0]** These six (6) READ/WRITE bit-fields permit the user to specify the FEAC Code word that the Transmit FEAC Controller sub-block (within the DS3/E3 Frame Generator block) should transmit to the remote terminal equipment. Once the user enables the "Transmit FEAC Controller sub-block" and commands it to begin its transmission, the Transmit FEAC Controller sub-block will then (1) encapsulate this six-bit code word into a 16-bit structure, (2) proceed to transmit this 16-bit structure 10 times, repeatedly, and then halt. ***Note:*** *These bit-fields are ignored if the user does not enable and use the Transmit FEAC Controller sub-block (within the DS3/E3 Frame Generator block).*
0	Unused	R/O	

Table 346: TxDS3 LAPD Configuration Register (Address Location= 0xN333, where N ranges from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
TxLAPD Any	Unused			Auto Retransmit	Reserved	TxLAPD Message Length	TxLAPD Enable
R/W	R/O	R/O	R/O	R/W	R/O	R/W	R/W
0	0	0	0	1	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	TxLAPD Any	R/W	**Transmit LAPD – Any kind:** This READ/WRITE bit-field permits the user to configure the Transmit LAPD Controller sub-block (within the DS3/E3 Frame Generator block) to transmit any kind of LAPD Message (or HDLC Message) with a size of 82 byte or less. If the user implements this option, then the Transmit LAPD Controller sub-block will be capable of transmitting any kind of HDLC frame (with any value of header bytes). The only restriction is that the size of the HDLC frame must not exceed 82 bytes. 0 – Does not invoke this "Any Kind of HDLC Message" feature. In this case, the LAPD Transmitter will only transmit HDLC Messages that contains the Bellcore GR-499-CORE values for SAPI and TEI. 1- Invokes this "Any Kind of HDLC Message" feature. In this case, the LAPD Transmitter will be able to transmit HDLC Messages that contain any header byte values. ***Note:*** *If the user invokes the "Any Kind of HDLC Message" feature, then he/she must indicate the size of the information payload (in terms of bytes) within the "Transmit LAPD Byte Count" Register (Address Location=0xN383).*
6 - 4	Unused	R/O	
3	Auto Retransmit	R/W	**Auto-Retransmit of LAPD Message:** This READ/WRITE bit-field permits the user to configure the Transmit LAPD Controller sub-block to transmit PMDL messages, repeatedly at one-second intervals. Once the user enables this feature, and then commands the Transmit LAPD Controller sub-block to transmit a given PMDL Message; the Transmit LAPD Controller sub-block will then proceed to transmit this PMDL Message (based upon the contents within the Transmit LAPD Message Buffer) repeatedly at one-second intervals. 0 – Disables the Auto-Retransmit Feature. In this case, the PMDL Message will only be transmitted once. Afterwards the Transmit LAPD Controller sub-block will proceed to transmit a continuous stream of Flag Sequence octets (0x7E) via the DL bits, within each output DS3 frame. No more PMDL Messages will be transmitted until the user commands another transmission. 1 – Enables the Auto-Retransmit Feature. In this case, the Transmit LAPD Controller sub-block will transmit PMDL messages (based upon the contents within the Transmit LAPD Message Buffer) repeatedly at one-second intervals. ***Note:*** *This bit-field is ignored if the Transmit LAPD Controller sub-block is disabled.*

2	Reserved	R/O	
1	TxLAPD Message Length	R/W	**Transmit LAPD Message Length Select:** This READ/WRITE bit-field permits the user to specify the length of the payload data within the outbound LAPD/PMDL Message, as indicated below. 0 – Configures the Transmit LAPD Controller sub-block to transmit a LAPD/PMDL message that has a payload data size of 76 bytes. 1 – Configures the Transmit LAPD Controller sub-block to transmit a LAPD/PMDL message that has a payload data size of 82 bytes. **NOTE:** This bit-field is ignored if the Transmit LAPD Controller sub-block is disabled.
0	Transmit LAPD Enable	R/W	**Transmit LAPD Controller sub-block Enable:** This READ/WRITE bit-field permits the user to enable the Transmit LAPD Controller sub-block, within the DS3/E3 Frame Generator block. Once the user enables the Transmit LAPD Controller sub-block, it will immediately begin transmitting the Flag Sequence octet (0x7E) to the remote terminal via the outbound "DL" bits, within each DS3 data stream. The Transmit LAPD Controller sub-block will continue to repeatedly transmit the Flag Sequence octet until the user commands the Transmit LAPD Controller sub-block to transmit a PMDL Message. 0 – Disables the Transmit LAPD Controller sub-block. 1 – Enables the Transmit LAPD Controller sub-block.

Table 347: TxDS3 LAPD Status/Interrupt Register (Address Location= 0xN334, where N ranges from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused				Initiate Transmission of LAPD/PMDL Message	Transmit LAPD Controller Busy	Transmit LAPD Interrupt Enable	Transmit LAPD Interrupt Status
R/O	R/O	R/O	R/O	R/W	R/O	R/W	RUR
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 4	Unused	R/O	
3	Initiate Transmission of LAPD/ PMDL Message	R/W	**Transmit LAPD Message Command:** A "0" to "1" transition, within this bit-field commands the Transmit LAPD Controller sub-block to begin the following activities: • Reading out the contents of the Transmit LAPD Message Buffer. • Zero-Stuffing of this data • FCS Calculation and Insertion • Fragmentation of this composite PMDL Message, and insertion into the "DL" bit-fields, within each outbound DS3 frame. **NOTE:** This bit-field is only active if the Transmit LAPD Controller block has been enabled.
2	Transmit LAPD Controller Busy	R/O	**Transmit LAPD Controller Busy Indicator:** This "READ-ONLY" bit-field indicates whether or not the Transmit LAPD Controller sub-block is currently busy transmitting a PMDL Message to the remote terminal equipment. The user can continuously poll this bit-field in order to check for completion of transmission of the LAPD/PMDL Message. 0 – Indicates that the Transmit LAPD Controller sub-block is NOT busy transmitting a PMDL Message. 1 – Indicates that the Transmit LAPD Controller sub-block is currently busy transmitting a PMDL Message. NOTE: This bit-field is only active if the Transmit LAPD Controller sub-block has been enabled.
1	Transmit LAPD Interrupt Enable	R/W	**Transmit LAPD Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Transmit LAPD Interrupt". If the user enables this interrupt, then the DS3/E3 Frame Generator block will generate an interrupt anytime the Transmit LAPD Controller sub-block has completed its transmission of a given LAPD/PMDL Message to the remote terminal. 0 – Disables the Transmit LAPD Interrupt. 1 – Enables the Transmit LAPD Interrupt.
0	Transmit LAPD Interrupt Status	RUR	**Transmit LAPD Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Transmit LAPD Interrupt" has occurred since the last read of this register as described below. 0 – Indicates that the Transmit LAPD Interrupt has NOT occurred since the last

			read of this register. 1 – Indicates that the Transmit LAPD Interrupt has occurred since the last read of this register.

Table 348: TxDS3 M-Bit Mask Register (Address Location= 0xN335, where N ranges from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
TxFEBEDat[2:0]			FEBE Register Enable	Tx P-Bit Error	TxM_Bit_Mask[2:0]		
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DECRIPTION
7 - 5	TxFEBEDat [2:0]	R/W	**Transmit FEBE Value:** These READ/WRITE bit-fields, along with "FEBE Register Enable" permit the user to configure the DS3/E3 Frame Generator block to transmit "user-specified" FEBE values (to the remote terminal) based upon the contents of these bit-fields. If the user sets the "FEBE Register Enable" bit-field to "1", then the DS3/E3 Frame Generator block will write the contents of these bit-fields into the FEBE bits, within each outbound DS3 frame. If the user sets the "FEBE Register Enable" bit-field to "0" then these register bits will be ignored.
4	FEBE Register Enable	R/W	**Transmit FEBE (by Software) Enable:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to transmit "user-specifed" FEBE values (to the remote terminal) per register setting via the "TxFEBEDat[2:0]" bit-field. This option provides the user with software control over the "outbound" FEBE values, within the DS3 data stream. 0 – Configures the DS3/E3 Frame Generator block to set the FEBE bit-fields (within each outbound DS3 frame) to the appropriate values based upon receive conditions, as determined by the companion Primary Frame Synchronizer block. 1 – Configures the DS3/E3 Frame Generator block to write the contents of the "TxFEBEDat[2:0]" bit-fields into the FEBE bits, within each "outbound" DS3 frame.
3	Tx P-Bit Error	R/W	**Transmit P-Bit Error:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to transmit DS3 frames with erred P-bits, as indicated below. 0 – Configures the DS3/E3 Frame Generator block to generate and transmit DS3 frames, to the remote terminal equipment. 1 – Configures the DS3/E3 Frame Generator block to generate and transmit DS3 frames, to the remote terminal equipment.
2 – 0	TxM_Bit_ Mask[2:0]	R/W	**Transmit M-Bit Error:** These READ/WRITE bit-fields permit the user to configure the DS3/E3 Frame Generator block to transmit DS3 frames with erred M-bits. These three (3) bit-fields correspond to the three M-bits, within each outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of these bit-fields and the value of the three M-bits. The results of this calculation will be written back into the M-bit positions within each outbound DS3 frame. The user should set these bit-fields to "0, 0, 0" for normal (e.g., un-erred) operation.

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 5	Unused	R/O	
4	F, M, P Bit Pass Thru Enable	R/W	**F-Bit, M-Bit, P-Bit Pass-Thru Enable:** This READ/WRITE bit-field permits the user to configure Frame Generator block to allow any F, M and P bits (within the DS3 signal) that it accepts to pass through in an un-altered manner. This feature is useful whenever the XRT94L33 device is handling unframed data that is operating at the DS3-rate (44.736MHz). 0 – Disables this feature 1 – Enables this feature
3	F Bit Mask[27]/ UDL Bit # 9 (C73)	R/W	**Transmit F-Bit Error – Bit 28/UDL Bit # 9 (C73):** The exact function of this register bit depends upon whether Bit 7 (TxOHSrc), within the "Test Register" (Address Location= 0xN30C) is set to "1" or "0". **If "TxOHSrc" = 0 – Transmit F-Bit Error – Bit 28:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to transmit DS3 frames with a single/particular erred F bit. This particular F-bit corresponds with the 28th F-bit, within a given outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 28th F-bit. The results of this calculation will be written back into the 28th F-bit position, within each outbound DS3 frame. The user should set this bit-field to "0" for normal (e.g., un-erred) operation. **If "TxOHSrc" = 1 – Insert Enable for UDL Bit # 9 or C73 bit:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to externally accept an overhead bit (from "up-stream" circuitry) and insert it into the "UDL Bit #9 (or C73)" bit-fields, within the outbound DS3 data-stream. 0 – Configures the DS3/E3 Frame Generator block to externally accept and insert data into this particular overhead bit-field (e.g., the UDL Bit # 9 or the C73 bit-field). 1 – Configures the DS3/E3 Frame Generator block to NOT externally accept and insert data into this overhead bit-field.
2	F Bit Mask [26]/ UDL Bit #8 (C72)	R/W	**Transmit F-Bit Error – Bit 27/UDL Bit # 8 (C72):** The exact function of this register bit depends upon whether Bit 7 (TxOHSrc), within the "Test Register" (Address Location= 0xN30C) is set to "1" or "0". **If "TxOHSrc" = 0 – Transmit F-Bit Error – Bit 27** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame

			Generator block to transmit DS3 frames with a single/particular erred F bit. This particular F-bit corresponds with the 27th F-bit, within a given outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 27th F-bit. The results of this calculation will be written back into the 27th F-bit position, within each outbound DS3 frame. The user should set this bit-field to "0" for normal (e.g., un-erred) operation. **If "TxOHSrc" = 1 – Insert Enable for UDL Bit # 8 or C72 bit:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to externally accept an overhead bit (from "up-stream" circuitry) and insert it into the "UDL Bit #8 (or C72)" bit-fields, within the outbound DS3 data-stream. 0 – Configures the DS3/E3 Frame Generator block to externally accept and insert data into this particular overhead bit-field (e.g., the UDL Bit # 8 or the C72 bit-field). 1 – Configures the DS3/E3 Frame Generator block to NOT externally accept and insert data into this overhead bit-field.
1	F Bit Mask [25]/ UDL Bit # 7 (C71)	R/W	**Transmit F-Bit Error – Bit 26/UDL Bit # 7 (C71):** The exact function of this register bit depends upon whether Bit 7 (TxOHSrc), within the "Test Register" (Address Location= 0xN30C) is set to "1" or "0". **If "TxOHSrc" = 0 – Transmit F-Bit Error – Bit 26:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to transmit DS3 frames with a single/particular erred F bit. This particular F-bit corresponds with the 26th F-bit, within a given outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 26th F-bit. The results of this calculation will be written back into the 26th F-bit position, within each outbound DS3 frame. The user should set this bit-field to "0" for normal (e.g., un-erred) operation. **If "TxOHSrc" = 1 – Insert Enable for UDL Bit # 7 or C71 bit:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to externally accept an overhead bit (from "up-stream" circuitry) and insert it into the "UDL Bit #7 (or C71)" bit-fields, within the outbound DS3 data-stream. 0 – Configures the DS3/E3 Frame Generator block to externally accept and insert data into this particular overhead bit-field (e.g., the UDL Bit # 7 or the C71 bit-field). 1 – Configures the DS3/E3 Frame Generator block to NOT externally accept and insert data into this overhead bit-field.
0	F Bit Mask [24]	R/W	**Transmit F-Bit Error – Bit 25:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to transmit DS3 frames with a single/particular erred F bit. This particular F-bit corresponds with the 25th F-bit, within a given outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 25th F-bit. The results of this calculation will be written back into the 25th F-bit position, within each outbound DS3 frame. The user should set this bit-field to "0" for normal (e.g., un-erred) operation. ***Note:*** *This bit-field is ignored if Bit 7 (TxOHSrc), within the "Test Register (Address Location= 0xN30C) is set to the "1".*

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	F Bit Mask[23]/ UDL Bit # 6 (C63)	R/W	**Transmit F-Bit Error – Bit 24/UDL Bit # 6 (C63):** The exact function of this register bit depends upon whether Bit 7 (TxOHSrc), within the "Test Register" (Indirect Address = 0xNE, 0x0C; Direct Address Address Location= 0xNFN30C) is set to "1" or "0". **If "TxOHSrc" = 0 – Transmit F-Bit Error – Bit 24:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to transmit DS3 frames with a single/particular erred F bit. This particular F-bit corresponds with the 24th F-bit, within a given outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 24th F-bit. The results of this calculation will be written back into the 24th F-bit position, within each outbound DS3 frame. The user should set this bit-field to "0" for normal (e.g., un-erred) operation. **If "TxOHSrc" = 1 - Insert Enable for UDL Bit # 6 or C63 bit:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to externally accept an overhead bit (from "up-stream" circuitry) and insert it into the "UDL Bit # 6 (or C63)" bit-fields, within the outbound DS3 data-stream. 0 - Configures the DS3/E3 Frame Generator block to externally accept and insert data into this particular overhead bit-field (e.g, the UDL Bit # 6 or the C63 bit-field). 1- Configures the DS3/E3 Frame Generator block to NOT externally accept and insert data into this overhead bit-field.
6	F Bit Mask [22]/ UDL Bit # 5 (C62)	R/W	**Transmit F-Bit Error – Bit 23/UDL Bit # 5 (C62):** The exact function of this register bit depends upon whether Bit 7 (TxOHSrc), within the "Test Register" (Address Location= 0xN30C) is set to "1" or "0". **If "TxOHSrc" = 0 – Transmit F-Bit Error – Bit 23:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to transmit DS3 frames with a single/particular erred F bit. This particular F-bit corresponds with the 23rd F-bit, within a given outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 23rd F-bit. The results of this calculation will be written back into the 23rd F-bit position, within each outbound DS3 frame. The user should set this bit-field to "0" for normal (e.g., un-erred) operation. **If "TxOHSrc" = 1 - Insert Enable for UDL Bit # 5 or C62 bit:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame

			Generator block to externally accept an overhead bit (from "up-stream" circuitry) and insert it into the "UDL Bit # 5 (or C62)" bit-fields, within the outbound DS3 data-stream. 0 - Configures the DS3/E3 Frame Generator block to externally accept and insert data into this particular overhead bit-field (e.g., the UDL Bit # 5 or the C62 bit-field). 1- Configures the DS3/E3 Frame Generator block to NOT externally accept and insert data into this overhead bit-field.
5	F Bit Mask [21]/ UDL Bit # 4 (C61)	R/W	**Transmit F-Bit Error – Bit 22/UDL Bit # 4 (C61):** The exact function of this register bit depends upon whether Bit 7 (TxOHSrc), within the "Test Register" (Address Location= 0xN30C) is set to "1" or "0". **If "TxOHSrc" = 0 – Transmit F-Bit Error – Bit 22:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to transmit DS3 frames with a single/particular erred F bit. This particular F-bit corresponds with the 22nd F-bit, within a given outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 22nd F-bit. The results of this calculation will be written back into the 22nd F-bit position, within each outbound DS3 frame. The user should set this bit-field to "0" for normal (e.g., un-erred) operation. **If "TxOHSrc" = 1 - Insert Enable for UDL Bit # 4 or C61 bit:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to externally accept an overhead bit (from "up-stream" circuitry) and insert it into the "UDL Bit # 4 (or C61)" bit-fields, within the outbound DS3 data-stream. 0 - Configures the DS3/E3 Frame Generator block to externally accept and insert data into this particular overhead bit-field (e.g., the UDL Bit # 4 or the C61 bit-field). 1- Configures the DS3/E3 Frame Generator block to NOT externally accept and insert data into this overhead bit-field.
4	F Bit Mask [20]	R/W	**Transmit F-Bit Error – Bit 21:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to transmit DS3 frames with a single/particular erred F bit. This particular F-bit corresponds with the 21st F-bit, within a given outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 21st F-bit. The results of this calculation will be written back into the 21st F-bit position, within each outbound DS3 frame. The user should set this bit-field to "0" for normal (e.g., un-erred) operation.
3	F Bit Mask [19]/ DL Bit # 3 (C53)	R/W	**Transmit F-Bit Error – Bit 20/DL Bit # 3 (C53):** The exact function of this register bit depends upon whether Bit 7 (TxOHSrc), within the "Test Register" (Address Location= 0xN30C) is set to "1" or "0". **If "TxOHSrc" = 0 – Transmit F-Bit Error – Bit 20:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to transmit DS3 frames with a single/particular erred F bit. This particular F-bit corresponds with the 20th F-bit, within a given outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 20th F-bit. The results of this calculation will be written back into the 20th F-bit position, within each outbound DS3 frame.

			The user should set this bit-field to "0" for normal (e.g., un-erred) operation. **If "TxOHSrc" = 1 - Insert Enable for DL Bit # 3 or C53 bit:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to externally accept an overhead bit (from "up-stream" circuitry) and insert it into the "DL Bit # 3 (or C53)" bit-fields, within the outbound DS3 data-stream. 0 - Configures the DS3/E3 Frame Generator block to externally accept and insert data into this particular overhead bit-field (e.g., the DL # Bit 3 or the C53 bit-field). 1- Configures the DS3/E3 Frame Generator block to NOT externally accept and insert data into this overhead bit-field.
2	F Bit Mask [18]/ DL Bit # 2 (C52)	R/W	**Transmit F-Bit Error – Bit 19/DL Bit # 2 (C52):** The exact function of this register bit depends upon whether Bit 7 (TxOHSrc), within the "Test Register" (Address Location= 0xN30C) is set to "1" or "0". **If "TxOHSrc" = 0 – Transmit F-Bit Error – Bit 19:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to transmit DS3 frames with a single/particular erred F bit. This particular F-bit corresponds with the 19th F-bit, within a given outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 19th F-bit. The results of this calculation will be written back into the 19th F-bit position, within each outbound DS3 frame. The user should set this bit-field to "0" for normal (e.g., un-erred) operation. **If "TxOHSrc" = 1 - Insert Enable for DL Bit # 2 or C52 bit:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to externally accept an overhead bit (from "up-stream" circuitry) and insert it into the "DL Bit # 2 (or C52)" bit-fields, within the outbound DS3 data-stream. 0 - Configures the DS3/E3 Frame Generator block to externally accept and insert data into this particular overhead bit-field (e.g., the DL Bit # 2 or the C52 bit-field). 1- Configures the DS3/E3 Frame Generator block to NOT externally accept and insert data into this overhead bit-field.
1	F Bit Mask [17]/ DL Bit # 1 (C51)	R/W	**Transmit F-Bit Error – Bit 18/DL Bit # 1 (C51):** The exact function of this register bit depends upon whether Bit 7 (TxOHSrc), within the "Test Register" (Address Location= 0xN30C) is set to "1" or "0". **If "TxOHSrc" = 0 – Transmit F-Bit Error – Bit 18:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to transmit DS3 frames with a single/particular erred F bit. This particular F-bit corresponds with the 18th F-bit, within a given outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 18th F-bit. The results of this calculation will be written back into the 18th F-bit position, within each outbound DS3 frame. The user should set this bit-field to "0" for normal (e.g., un-erred) operation. **If "TxOHSrc" = 1 - Insert Enable for DL Bit # 1 or C51 bit:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to externally accept an overhead bit (from "up-stream" circuitry) and insert it into the "DL Bit # 1 (or C51)" bit-fields, within the outbound DS3 data-stream.

			0 - Configures the DS3/E3 Frame Generator block to externally accept and insert data into this particular overhead bit-field (e.g., the DL Bit # 1 or the C51 bit-field). 1- Configures the DS3/E3 Frame Generator block to NOT externally accept and insert data into this overhead bit-field.
0	F Bit Mask [16]	R/W	**Transmit F-Bit Error – Bit 17:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to transmit DS3 frames with a single/particular erred F bit. This particular F-bit corresponds with the 17th F-bit, within a given outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 17th F-bit. The results of this calculation will be written back into the 17th F-bit position, within each outbound DS3 frame. The user should set this bit-field to “0” for normal (e.g., un-erred) operation.

This particular F-bit corresponds with the 14th F-bit, within a given outbound DS3 frame. The DS3/E# Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 14th F-bit. The results of this calculation will be written back into the 14th F-bit position, within each outbound DS3 frame. The user should set this bit-field to "0" for normal (e.g., un-erred) operation. **If "TxOHSrc" = 1 - Insert Enable for FEBE Bit # 1 or C41 bit:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to externally accept an overhead bit (from "up-stream" circuitry) and insert it into the "FEBE Bit # 1 (or C41)" bit-fields, within the outbound DS3 data-stream. 0 - Configures the DS3/E3 Frame Generator block to externally accept and insert data into this particular overhead bit-field (e.g, the FEBE Bit # 1 or the C41 bit-field). 1- Configures the DS3/E3 Frame Generator block to NOT externally accept and insert data into this overhead bit-field.
4	F Bit Mask [12]	R/W	**Transmit F-Bit Error – Bit 13:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to transmit DS3 frames with a single/particular erred F bit. This particular F-bit corresponds with the 13th F-bit, within a given outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 13th F-bit. The results of this calculation will be written back into the 13th F-bit position, within each outbound DS3 frame. The user should set this bit-field to "0" for normal (e.g., un-erred) operation.
3	F Bit Mask [11]/ CP Bit # 3 (C33)	R/W	**Transmit F-Bit Error – Bit 12/CP Bit # 3 (C33):** The exact function of this register bit depends upon whether Bit 7 (TxOHSrc), within the "Test Register" (Address Location= 0xN30C) is set to "1" or "0". **If "TxOHSrc" = 0 – Transmit F-Bit Error – Bit 12:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to transmit DS3 frames with a single/particular erred F bit. This particular F-bit corresponds with the 12th F-bit, within a given outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 12th F-bit. The results of this calculation will be written back into the 12th F-bit position, within each outbound DS3 frame.

			The user should set this bit-field to "0" for normal (e.g., un-erred) operation. **If "TxOHSrc" = 1 - Insert Enable for CP Bit # 3 or C33 bit:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to externally accept an overhead bit (from "up-stream" circuitry) and insert it into the "CP Bit # 3 (or C33)" bit-fields, within the outbound DS3 data-stream. 0 - Configures the DS3/E3 Frame Generator block to externally accept and insert data into this particular overhead bit-field (e.g., the CP Bit # 3 or the C33 bit-field). 1- Configures the DS3/E3 Frame Generator block to NOT externally accept and insert data into this overhead bit-field.
2	F Bit Mask [10]/ CP Bit # 2 (C32)	R/W	**Transmit F-Bit Error – Bit 11/CP Bit # 2 (C32):** The exact function of this register bit depends upon whether Bit 7 (TxOHSrc), within the "Test Register" (Address Location= 0xN30C) is set to "1" or "0". **If "TxOHSrc" = 0 – Transmit F-Bit Error – Bit 11:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to transmit DS3 frames with a single/particular erred F bit. This particular F-bit corresponds with the 11th F-bit, within a given outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 11th F-bit. The results of this calculation will be written back into the 11th F-bit position, within each outbound DS3 frame. The user should set this bit-field to "0" for normal (e.g., un-erred) operation. **If "TxOHSrc" = 1 - Insert Enable for CP Bit # 2 or C32 bit:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to externally accept an overhead bit (from "up-stream" circuitry) and insert it into the "CP Bit # 2 (or C32)" bit-fields, within the outbound DS3 data-stream. 0 - Configures the DS3/E3 Frame Generator block to externally accept and insert data into this particular overhead bit-field (e.g., the CP Bit # 2 or the C32 bit-field). 1- Configures the DS3/E3 Frame Generator block to NOT externally accept and insert data into this overhead bit-field.
1	F Bit Mask [9]/ CP Bit # 1 (C31)	R/W	**Transmit F-Bit Error – Bit 10/CP Bit # 1 (C31):** The exact function of this register bit depends upon whether Bit 7 (TxOHSrc), within the "Test Register" (Address Location= 0xN30C) is set to "1" or "0". **If "TxOHSrc" = 0 – Transmit F-Bit Error – Bit 10:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to transmit DS3 frames with a single/particular erred F bit. This particular F-bit corresponds with the 10th F-bit, within a given outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 10th F-bit. The results of this calculation will be written back into the 10th F-bit position, within each outbound DS3 frame. The user should set this bit-field to "0" for normal (e.g., un-erred) operation. **If "TxOHSrc" = 1 - Insert Enable for CP Bit # 1 or C31 bit:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to externally accept an overhead bit (from "up-stream" circuitry) and insert it into the "CP Bit # 1 (or C31)" bit-fields, within the outbound DS3 data-stream.

			0 - Configures the DS3/E3 Frame Generator block to externally accept and insert data into this particular overhead bit-field (e.g., the CP Bit # 1 or the C31 bit-field). 1- Configures the DS3/E3 Frame Generator block to NOT externally accept and insert data into this overhead bit-field.
0	F Bit Mask [8]	R/W	**Transmit F-Bit Error – Bit 9:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to transmit DS3 frames with a single/particular erred F bit. This particular F-bit corresponds with the 9th F-bit, within a given outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 9th F-bit. The results of this calculation will be written back into the 9th F-bit position, within each outbound DS3 frame. The user should set this bit-field to “0” for normal (e.g., un-erred) operation.

This particular F-bit corresponds with the 6th F-bit, within a given outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 6th F-bit. The results of this calculation will be written back into the 6th F-bit position, within each outbound DS3 frame. The user should set this bit-field to “0” for normal (e.g., un-erred) operation. **If “TxOHSrc” = 1 - Insert Enable for UDL Bit # 1 or C21 bit:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to externally accept an overhead bit (from “up-stream” circuitry) and insert it into the “UDL Bit # 1 (or C21)” bit-field, within the outbound DS3 data-stream. 0 - Configures the DS3/E3 Frame Generator block to externally accept and insert data into this overhead bit-field (e.g., the UDL Bit # 1 or the C21 bit-field). 1- Configures the DS3/E3 Frame Generator block to NOT externally accept and insert data into this overhead bit-field.
4	F Bit Mask [4]/ X Bit # 2	R/W	**Transmit F-Bit Error – Bit 5/X Bit # 2:** The exact function of this register bit depends upon whether Bit 7 (TxOHSrc), within the “Test Register” (Address Location= 0xN30C) is set to “1” or “0”. **If “TxOHSrc” = 0 – Transmit F-Bit Error – Bit 5:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to transmit DS3 frames with a single/particular erred F bit. This particular F-bit corresponds with the 5th F-bit, within a given outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 5th F-bit. The results of this calculation will be written back into the 5th F-bit position, within each outbound DS3 frame. The user should set this bit-field to “0” for normal (e.g., un-erred) operation. **If “TxOHSrc” = 1 - Insert Enable for X Bit # 2:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to externally accept an overhead bit (from “up-stream” circuitry) and insert it into the “X-Bit # 2” bit-field, within the outbound DS3 data-stream. 0 - Configures the DS3/E3 Frame Generator block to externally accept and insert data into this overhead bit-field (e.g., the X bit # 2). 1- Configures the DS3/E3 Frame Generator block to NOT externally accept and insert data into this overhead bit-field.
3	F Bit Mask [3]/	R/W	**Transmit F-Bit Error – Bit 4/FEAC Bit (C13):**

	FEAC Bit (C13)		The exact function of this register bit depends upon whether Bit 7 (TxOHSrc), within the "Test Register" (Address Location= 0xN30C) is set to "1" or "0". **If "TxOHSrc" = 0 – Transmit F-Bit Error – Bit 4:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to transmit DS3 frames with a single/particular erred F bit. This particular F-bit corresponds with the 4th F-bit, within a given outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 4th F-bit. The results of this calculation will be written back into the 4th F-bit position, within each outbound DS3 frame. The user should set this bit-field to "0" for normal (e.g., un-erred) operation. **If "TxOHSrc" = 1 - Insert Enable for FEAC or C13 bit:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to externally accept an overhead bit (from "up-stream" circuitry) and insert it into the "FEAC (or C13)" bit-field, within the outbound DS3 data-stream. 0 - Configures the DS3/E3 Frame Generator block to externally accept and insert data into this overhead bit-field (e.g., the FEAC or the C13 bit-field). 1- Configures the DS3/E3 Frame Generator block to NOT externally accept and insert data into this overhead bit-field.
2	F Bit Mask [2]/ NA Bit (C12)	R/W	**Transmit F-Bit Error – Bit 3/NA Bit (C12):** The exact function of this register bit depends upon whether Bit 7 (TxOHSrc), within the "Test Register" (Address Location= 0xN30C) is set to "1" or "0". **If "TxOHSrc" = 0 – Transmit F-Bit Error – Bit 3:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to transmit DS3 frames with a single/particular erred F bit. This particular F-bit corresponds with the 3rd F-bit, within a given outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 3rd F-bit. The results of this calculation will be written back into the 3rd F-bit position, within each outbound DS3 frame. The user should set this bit-field to "0" for normal (e.g., un-erred) operation. **If "TxOHSrc" = 1 - Insert Enable for NA or C12 bit:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to externally accept an overhead bit (from "up-stream" circuitry) and insert it into the "NA (or C12)" bit-field, within the outbound DS3 data-stream. 0 - Configures the DS3/E3 Frame Generator block to externally accept and insert data into this overhead bit-field (e.g., the NA or the C12 bit-field). 1- Configures the DS3/E3 Frame Generator block to NOT externally accept and insert data into this overhead bit-field.
1	F Bit Mask [1]/ AIC Bit (C11)	R/W	**Transmit F-Bit Error – Bit 2/AIC Bit (C11):** The exact function of this register bit depends upon whether Bit 7 (TxOHSrc), within the "Test Register" (Address Location= 0xN30C) is set to "1" or "0". **If "TxOHSrc" = 0 – Transmit F-Bit Error – Bit 2:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to transmit DS3 frames with a single/particular erred F bit. This particular F-bit corresponds with the 2nd F-bit, within a given outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 2nd F-bit. The results of this

			calculation will be written back into the 2nd F-bit position, within each outbound DS3 frame. The user should set this bit-field to "0" for normal (e.g., un-erred) operation. **If "TxOHSrc" = 1 - Insert Enable for AIC or C11 bit:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to externally accept an overhead bit (from "up-stream" circuitry) and insert it into the "AIC (or C11)" bit-field, within the outbound DS3 data-stream. 0 - Configures the DS3/E3 Frame Generator block to externally accept and insert data into this overhead bit-field (e.g., the AIC or the C11 bit-field). 1- Configures the DS3/E3 Frame Generator block to NOT externally accept and insert data into this overhead bit-field.
0	F Bit Mask [0]/ X Bit # 1	R/W	**Transmit F-Bit Error – Bit 1/X Bit # 1:** The exact function of this register bit depends upon whether Bit 7 (TxOHSrc), within the "Test Register" (Address Location= 0xN30C) is set to "1" or "0". **If "TxOHSrc" = 0 – Transmit F-Bit Error – Bit 1:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to transmit DS3 frames with a single/particular erred F bit. This particular F-bit corresponds with the 1st F-bit, within a given outbound DS3 frame. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of this bit-field and value of the 1st F-bit. The results of this calculation will be written back into the 1st F-bit position, within each outbound DS3 frame. The user should set this bit-field to "0" for normal (e.g., un-erred) operation. **If "TxOHSrc" = 1 - Insert Enable for X Bit # 1:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to externally accept an overhead bit (from "up-stream" circuitry) and insert it into the "X-Bit # 1" bit-field, within the outbound DS3 data-stream. 0 - Configures the DS3/E3 Frame Generator block to externally accept and insert data into this overhead bit-field (e.g., the X-bit # 1 bit-field). 1- Configures the DS3/E3 Frame Generator block to NOT externally accept and insert data into this overhead bit-field.

Table 353: Transmit DS3 Pattern Register (Address Location= 0xN34C, where N ranges from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
TxAIS - Unframed All Ones	DS3 AIS Non-Stuck Stuff		TxLOS Pattern Select	Transmit_Idle_Pattern[3:0]			
R/W	R/W	R/O	R/W	R/W	R/W	R/W	R/W
0	0	0	0	1	1	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	TxAIS - Unframed All Ones	R/W	**Transmit AIS – Unframed All Ones:** This READ/WRITE bit-field permits the user to configure the "DS3/E3 Frame Generator" block to transmit either of the following patterns, anytime it is configured to transmit the AIS indicator. • A "Framed, repeating 1, 0, 1, 0… pattern (per Bellcore GR-499-CORE) or • An "Unframed All Ones" pattern. 0 – Configures both the DS3/E3 Frame Generator block and the AIS/DS3 Idle Signal Pattern Generator (within the Primary Frame Synchronizer block) to transmit the "Framed, Repeating 1, 0, 1, 0, … pattern; whenever it is configured to transmit the AIS indicator. 1- Configures both the DS3/E3 Frame Generator and the AIS/DS3 Idle Signal Pattern Generator (within the Primary Frame Synchronizer block) to transmit an "Unframed, All-Ones" pattern, whenever it is configured to transmit the AIS indicator. **NOTE:** This configuration setting applies to both the DS3/E3 Frame Generator block and the AIS/DS3 Idle Signal Pattern Generator sub-block (within the Primary Frame Synchronizer block)
6	DS3 AIS Non-Stuck Stuff	R/W	**DS3 AIS – Non-Stuck Stuff Option – AIS Pattern:** This READ/WRITE bit-field (along with the "TxAIS – Unframed All Ones" bit-field) permits the user to define the type of AIS data-stream that both the DS3/E3 Frame Generator and the AIS/DS3 Idle Signal Pattern Generator sub-block (within the Primary Frame Synchronizer block) will transmit, as described below. 0 – Configures the DS3/E3 Frame Generator block and the AIS/DS3 Idle Signal Pattern Generator sub-block to force all of the "C" bits to "0", whenever it is configured to transmit a Framed AIS signal. 1 – Configures the DS3/E3 Frame Generator block and the AIS/DS3 Idle Signal Pattern Generator sub-block to NOT force all of the "C" bits to "0", when it is configured to transmit a Framed AIS signal. In this case, the "C" bits can be used to transport FEAC and PMDL Messages. **NOTE:** This bit-field is ignored if the DS3/E3 Frame Generator block and the AIS/DS3 Idle Signal Pattern Generator sub-block has been configured to transmit an "Unframed – All Ones" type of AIS signal.
5	Unused	R/W	
4	TxLOS Pattern Select	R/W	**Transmit LOS Pattern Select:** This READ/WRITE bit-field permits the user to configure the "DS3/E3 Frame Generator" block to transmit either an "All Zeros" or an "All Ones" pattern, anytime it is configured to transmit the "LOS Pattern" to

			the remote terminal equipment, as described below. 0 – Configures the DS3/E3 Frame Generator to transmit an "All Zeros" pattern, whenever it is configured to transmit the LOS pattern. 1 – Configures the DS3/E3 Frame Generator to transmit an "All Ones" pattern, whenever it is configured to transmit the LOS pattern.
3 - 0	Tx_Idle Pattern[3:0]	R/W	**Transmit DS3 Idle Signal Pattern:** These READ/WRITE bit-fields permit the user to specify the type of framed, repetitive four-bit pattern that the DS3/E3 Frame Generator block should send, whenever it is transmitting the "DS3 Idle" pattern. ***Note:*** *Setting these bit-fields to "[1, 1, 0, 0] configures the DS3/E3 Frame Generator block to transmit the standard "Framed, repeating "1, 1, 0, 0, …" pattern (per Bellcore GR-499-CORE) requirements.*

1.10.6 TRANSMIT E3, ITU-T G.751 RELATED REGISTERS

Table 354: TxE3 Configuration Register – G.751 (Address Location= 0xN330, where N ranges from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
TxBIP-4 Enable	TxASrcSel[1:0]		TxNSrcSel[1:0]		TxAIS Enable	TxLOS Enable	TxFAS Source Sel
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	TxBIP-4 Enable	R/W	**Transmit BIP-4 Enable:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to do the following: • To compute the BIP-4 value over a given outbound E3 frame. • To insert this BIP-4 value into the last nibble-field within the very next E3 frame. 0 – Does not configure this option. In this case, the last nibble (of each "outbound" E3 frame) will contain payload data. 1 – Configures the DS3/E3 Frame Generator block to compute and insert the BIP-4 value.
6 - 5	TxASrcSel[1:0]	R/W	**Transmit A Bit Source Select[1:0]:** These two READ/WRITE bit-fields permit the user to specify the source or type of data that is being carried via the "A" bits, within each "outbound" E3 data stream, as indicated below.

TxASrcSel[1:0]		Resulting Source of A Bit
0	0	The "TxA" bit-field, within the "TxE3 Service Bit" register (Address Location= 0xN335).
0	1	Not Valid - Do not use.
1	0	The "A" bit is sourced via up-stream circuitry and inserted into the "outbound E3 data-stream. This is discussed in greater detail in Section _.
1	1	The Companion Primary Frame Synchronizer block. In this case, the A bit will transmit the FEBE indicator to the remote terminal equipment. The A bit will be set to "1" when the companion Primary Frame Synchronizer block detects a BIP-4 error, and will be set to "0" when the Primary Frame Synchronizer block detects un-erred E3 frames.

<table>
<tr><td>4 – 3</td><td>TxNSrcSel[1:0]</td><td>R/W</td><td>Transmit N Bit Source Select[1:0]:

These two READ/WRITE bit-fields permit the user to specify the source or type of data that is being carried via the “N” bits, within each “outbound” E3 data stream, as indicated below.

<table>

R/O	R/O	R/O	R/O	R/W	R/O	R/W	R/W
0	0	0	0	1	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 4	Unused	R/O	
3	Auto Retransmit	R/W	**Auto-Retransmit of LAPD Message:** This READ/WRITE bit-field permits the user to configure the Transmit LAPD Controller sub-block (within the DS3/E3 Frame Generator block) to transmit PMDL messages, repeatedly at one-second intervals. Once the user enables this feature, and then commands the Transmit LAPD Controller sub-block to transmit a given PMDL Message; the Transmit LAPD Controller sub-block will then proceed to transmit this PMDL Message (based upon the contents within the Transmit LAPD Message Buffer) repeatedly at one-second intervals. 0 – Disables the Auto-Retransmit Feature. In this case, the Transmit LAPD Controller sub-block will transmit this PMDL Message only once, afterwards the Transmit LAPD Controller sub-block will proceed to transmit a continuous stream of Flag Sequence octets (0x7E) via the DL bits, within each output DS3 frame. No more PMDL Messages will be transmitted until the user commands another transmission. 1 – Enables the Auto-Retransmit Feature. In this case, the Transmit LAPD Controller sub-block will transmit PMDL messages (based upon the contents within the Transmit LAPD Message Buffer) repeatedly at one-second intervals. ***Note:*** *This bit-field is ignored if the Transmit LAPD Controller sub-block is disabled.*
2	Reserved	R/O	
1	Transmit LAPD Message Length	R/W	**Transmit LAPD Message Length Select:** This READ/WRITE bit-field permits the user to specify the length of the payload data within the outbound LAPD/PMDL Message, as indicated below. 0 – Configures the Transmit LAPD Controller sub-block to transmit a LAPD/PMDL message that has a payload data size of 76 bytes. 1 – Configures the Transmit LAPD Controller sub-block to transmit a LAPD/PMDL message that has a payload data size of 82 bytes.
0	Transmit LAPD Enable	R/W	**Transmit LAPD Controller sub-block Enable:** This READ/WRITE bit-field permits the user to enable the Transmit LAPD Controller sub--block, within the DS3/E3 Frame Generator block. Once the user enables the Transmit LAPD Controller sub-block, it will immediately begin transmitting the Flag Sequence octet (0x7E) to the remote terminal via the outbound "DL" bits, within each DS3 data stream. The Transmit LAPD Controller sub-block will continue to do this until the user commands the Transmit LAPD Controller sub-block to transmit a PMDL Message.

			0 – Disables the Transmit LAPD Controller sub-block. 1 – Enables the Transmit LAPD Controller sub-block.

Table 356: TxE3 LAPD Status/Interrupt Register – G.751 (Address Location= 0xN334, where N ranges from 0x02 to 0x04)

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 5	Unused	R/O	
4 – 0	TxFAS_Error_Mask_ Upper[4:0]	R/W	**TxFAS Error Mask Upper[4:0]:** These READ/WRITE bit-fields permit the user to insert bit errors into the upper five bits, within the FAS (Framing Alignment Signal), within the outbound E3 data stream. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of these FAS bits, and this register. The results of this calculation will be inserted into the upper 5 FAS bit positions within the "outbound" E3 data stream. For each bit-field (within this register) that is set to "1", the corresponding bit, within the FAS will be in error. ***Note:*** *For normal operation, the user should set this register to 0x00.*

3 - 0	TxBIP-4_Mask_[3:0]	R/W	**TxBIP-4 Error Mask[3:0]:** These READ/WRITE bit-fields permit the user to insert bit errors into the BIP-4 bits, within the outbound E3 data stream. The DS3/E3 Frame Generator block will perform an XOR operation with the contents of the BIP-4 bits, and this register. The results of this calculation will be inserted into the BIP-4 bit positions within the "outbound" E3 data stream. For each bit-field (within this register) that is set to "1", the corresponding bit, within the BIP-4 will be in error. ***Note:*** *For normal operation, the user should set this register to 0x00.*

1.10.7 TRANSMIT E3, ITU-T G.832 RELATED REGISTERS

Table 361: TxE3 Configuration Register – G.832 (Address Location= 0xN330, where N ranges from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused			TxDL in NR	Reserved	TxAIS Enable	TxLOS Enable	TxMA Rx
R/O	R/O	R/O	R/W	R/O	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 5	Unused	R/O	
4	TxDL in NR	R/W	**Transmit DL (Data Link Channel) in NR Byte:** This READ/WRITE bit-field permits the user to configure the Transmit LAPD Controller sub-block (within the DS3/E3 Frame Generator block) to use either the NR or the GC byte as the LAPD/PMDL channel, as described below. 0 – Configures the Transmit LAPD Controller sub-block to transmit all "outbound" LAPD/PMDL Messages via the GC byte. 1 – Configures the Transmit LAPD Controller sub-block to transmit all "outbound" LAPD/PMDL Messages via the NR byte.
3	Unused	R/O	
2	TxAIS Enable	R/W	**Transmit AIS Indicator:** This READ/WRITE bit-field permits the user to (by software control) force the DS3/E3 Frame Generator block to generate and transmit the AIS indicator to the remote terminal equipment as described below. 0 – Does not configure the DS3/E3 Frame Generator block to generate and transmit the AIS indicator. In this case, the DS3/E3 Frame Generator block will transmit normal E3 traffic. 1 – Configures the DS3/E3 Frame Generator block to generate and transmit the AIS indicator. In this case, the DS3/E3 Frame Generator will force all bits (within the "outbound" E3 data stream) to an "Unframed, All Ones" pattern. ***Note:*** *This bit-field is ignored if the DS3/E3 Frame Generator block has been configured to transmit the LOS pattern.*
1	TxLOS Enable	R/W	**Transmit LOS (Pattern) Enable:** This READ/WRITE bit-field permits the user to (by software control) force the DS3/E3 Frame Generator block to transmit the LOS (Loss of Signal) pattern to the remote terminal equipment. 0 – Does not configure the DS3/E3 Frame Generator block to generate and transmit the LOS pattern. In this case, the DS3/E3 Frame Generator block will transmit normal E3 traffic. 1 – Configures the DS3/E3 Frame Generator block to generate and transmit the LOS pattern. In this case, the DS3/E3 Frame Generator block will force all bits (within the "outbound" E3 data stream) to an "All Zeros" pattern.
0	TxMA Primary Frame Synchronizer Block	R/W	**Transmit MA Byte from Primary Frame Synchronizer Block Select:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to use either the Primary Frame Synchronizer block or the "Tx MA Byte" Register as the source of the FERF/RDI and FERF/REI bit-fields

			MA Byte" Register as the source of the FERF/RDI and FEBE/REI bit-fields (within the MA byte-field of the "outbound" E3 data stream); as indicated below. 0 – Configures the DS3/E3 Frame Generator block to read in the contents of the "Tx MA Byte" register (Address Location= 0xN336), and write this value into the "MA" byte-field within each "outbound" E3 frame. ***Note:*** *This option permits the user to send the FERF/RDI and FEBE/REI indicators, under software control.* 1 – Configures the DS3/E3 Frame Generator block to set the FERF/RDI and FEBE/REI bit-fields to values, based upon conditions detected by the companion Priimary Frame Synchronizer block.

Table 362: TxE3 LAPD Configuration Register – G.832 (Address Location= 0xN333, where N ranges from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0

R/O	R/O	R/O	R/O	R/W	R/O	R/W	R/W
0	0	0	0	1	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 4	Unused	R/O	
3	Auto Retransmit	R/W	**Auto-Retransmit of LAPD Message:** This READ/WRITE bit-field permits the user to configure the Transmit LAPD Controller sub-block to transmit PMDL messages, repeatedly at one-second intervals. Once the user enables this feature, and then commands the Transmit LAPD Controller sub-block to transmit a given PMDL Message; the Transmit LAPD Controller sub-block will then proceed to transmit this PMDL Message (based upon the contents within the Transmit LAPD Message Buffer) repeatedly at one-second intervals. 0 – Disables the Auto-Retransmit Feature. In this case, the Transmit LAPD Controller sub-block will only transmit the PMDL Message once. Afterwards the Transmit LAPD Controller sub-block will proceed to transmit a continuous stream of Flag Sequence octets (0x7E) via either the NR or GC byte, within each output E3 frame. The Transmit LAPD Controller sub-block will not transmit any more PMDL Messages until the user commands another transmission. 1 – Enables the Auto-Retransmit Feature. In this case, the Transmit LAPD Controller sub-block will transmit PMDL messages (based upon the contents within the Transmit LAPD Message Buffer) repeatedly at one-second intervals. ***Note:*** *This bit-field is ignored if the Transmit LAPD Controller sub-block is disabled.*
2	Reserved	R/O	
1	Transmit LAPD Message Length	R/W	**Transmit LAPD Message Length Select:** This READ/WRITE bit-field permits the user to specify the length of the payload data within the outbound LAPD/PMDL Message, as indicated below. 0 – Configures the Transmit LAPD Controller sub-block to transmit a LAPD/PMDL message that has a payload data size of 76 bytes. 1 – Configures the Transmit LAPD Controller sub-block to transmit a LAPD/PMDL message that has a payload data size of 82 bytes. **NOTE:** This bit-field is ignored if the Transmit LAPD Controller sub-block is disabled.
0	Transmit LAPD Enable	R/W	**Transmit LAPD Controller Sub-Block Enable:** This READ/WRITE bit-field permits the user to enable the Transmit LAPD Controller sub-block, within the DS3/E3 Frame Generator block. Once the user enables the Transmit LAPD Controller sub-block, it will immediately begin transmitting the Flag Sequence octet (0x7E) to the remote terminal via either the “NR” or “GC” bytes, within the outbound E3 data stream. The Transmit LAPD Controller sub-block will continue to do this until the user commands the

			Transmit LAPD Controller sub-block to transmit a PMDL Message. 0 – Disables the Transmit LAPD Controller sub-block. 1 – Enables the Transmit LAPD Controller sub-block.

Table 363: TxE3 LAPD Status/Interrupt Register – G.832 (Address Location= 0xN334, where N ranges from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0

R/O	R/O	R/O	R/O	R/W	R/O	R/W	RUR
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 4	Unused	R/O	
3	Initiate Transmission of LAPD/ PMDL Message	R/W	**Transmit LAPD Message Command:** A "0" to "1" transition, within this bit-field commands the Transmit LAPD Controller sub-block to begin the following activities: • Reading out the contents of the Transmit LAPD Message Buffer. • Zero-Stuffing of this data • FCS Calculation and Insertion • Fragmentation of this composite PMDL Message, and insertion into either the "NR" or "GC" byte-fields, within each outbound E3 frame. **NOTE:** This bit-field is only active if the Transmit LAPD Controller sub-block has been enabled.
2	Transmit LAPD Controller Busy	R/O	**Transmit LAPD Controller Busy Indicator:** This "READ-ONLY" bit-field indicates whether or not the Transmit LAPD Controller sub-block is currently busy transmitting a PMDL Message to the remote terminal equipment. The user can continuously poll this bit-field in order to check for completion of transmission of the LAPD/PMDL Message. 0 – Indicates that the Transmit LAPD Controller sub-block is NOT busy transmitting a PMDL Message. 1 – Indicates that the Transmit LAPD Controller sub-block is currently busy transmitting a PMDL Message. **NOTE:** This bit-field is only active if the Transmit LAPD Controller sub-block has been enabled.
1	Transmit LAPD Interrupt Enable	R/W	**Transmit LAPD Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Transmit LAPD Interrupt". If the user enables this interrupt, then the DS3/E3 Frame Generator block will generate an interrupt anytime the Transmit LAPD Controller sub-block has completed its transmission of a given LAPD/PMDL Message to the remote terminal. 0 – Disables Transmit LAPD Interrupt. 1 – Enables Transmit LAPD Interrupt.
0	Transmit LAPD Interrupt Status	RUR	**Transmit LAPD Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Transmit LAPD Interrupt" has occurred since the last read of this register, as described below. 0 – Indicates that the Transmit LAPD Interrupt has NOT occurred since the last

			read of this register. 1 – Indicates that the Transmit LAPD Interrupt has occurred since the last read of this register.

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	TxSSM Enable	R/W	**Transmit SSM Enable:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Frame Generator block to operate in either the "Old ITU-T G.832 Framing" format or in the "New ITU-T G.832 Framing" format, as described below. 0 – Configures the DS3/E3 Frame Generator block to support the "Pre October 1998" version of the E3, ITU-T G.832 framing format. 1 – Configures the DS3/E3 Frame Generator block to support the "October 1998" version of the E3, ITU-T G.832 framing format.
6 - 4	Unused	R/O	
3 - 0	TxSSM[3:0]	R/W	**Transmit Synchronization Status Message[3:0]:** These READ/WRITE bit-fields permit the user to specify the contents of the "outbound" Synchronization Status Message (SSM) that is to be transported vai the "outbound" E3 data-stream. The Transmit SSM Controller sub-block (within the DS3/E3 Frame Generator block) will then proceed to transport this SSM via the outbound E3 data-stream. ***Note:*** *These bit-fields are only active if the DS3/E3 Frame Generator block is active, and if Bit 7 (TxSSM Enable) of this register is set to "1".*

1.10.8 AIS/PDI-P ALARM ENABLE REGISTER

Table 387: Receive DS3/E3 AIS/PDI-P Alarm Enable Register – Primary Frame Synchronizer Block (Address Location= 0xN34D, where N ranges from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused		Transmit PDI-P (Down-stream) upon LOS	Transmit AIS (Down-stream) upon LOS	Transmit PDI-P (Down-stream) upon LOF	Transmit AIS (Down-stream) upon LOF	Transmit PDI-P (Down-stream) upon AIS	Transmit AIS (Down-stream) upon AIS
R/O	R/O	R/W	R/W	R/W	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 6	Unused	R/O	
5	Transmit PDI-P (Down-stream) upon LOS	R/W	**Transmit the PDI-P indicator (Down-stream) upon declaration of the DS3/E3 LOS defect condition:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Framer block (via the Primary Frame Synchronizer block) and the Transmit SONET POH Processor block to automatically transmit the PDI-P (Path – Payload Defect Indicator) anytime the LOS defect is declared within the DS3/E3 Ingress Path. More specifically, if this configuration is implemented then the following events will occur. If the Primary Frame Synchronizer block is operating in the "DS3/E3 Ingress" path (e.g., if the DS3/E3 Framer block has been configured to operate in Frame Generator/Frame Synchronizer Configuration # 0xE6), and if it were to declare the LOS defect condition (within the Ingress Path), then the corresponding Transmit SONET POH Processor block will automatically transmit the PDI-P indicator (via its STS-1 signal, within the outbound composite STS-3 signal), by setting the C2 byte (within each "down-stream" STS-1 SPE) to the value "0xFC". The Transmit SONET POH Processor block will continue to transmit the PDI-P indicator for the duration that the Primary Frame Synchronizer block declares the LOS defect condition. Once the Primary Frame Synchronizer block clears the LOS defect, then the Transmit SONET POH Processor block will automatically terminate its transmission of the PDI-P indicator by setting the C2 byte (within each "down-stream" STS-1 SPE) to the "0x04". 0 – Disables this "Transmit PDI-P (Down-stream) upon LOS feature. 1 – Enables this "Transmit PDI-P (Down-stream) upon LOS feature. **NOTE:** The user should only invoke this feature if the Primary Frame Synchronizer block has been configured to operate in the DS3/E3 Ingress Path.

4	Transmit AIS (Down-stream) upon LOS	R/W	**Transmit the DS3/E3 AIS Indicator (Down-stream) upon declaration of the LOS defect condition:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Framer block to do all of the following, if the LOS defect is declared. If the Primary Frame Synchronizer block declares the LOS detect (within its Receive Path) then the AIS/DS3 Idle Signal Pattern Generator (within the Primary Frame Synchronizer block) will automatically transmit the DS3/E3 AIS indicator, via its output Path. In this case, the AIS/DS3 Idle Signal Pattern Generator will transmit the AIS indicator (in the down-stream path) for the duration that the Primary Frame Synchronizer block declares the LOS defect condition. Once the Primary Frame Synchronizer block clears the LOS defect condition, then the AIS/DS3 Idle Signal Pattern Generator (within the Primary Frame Synchronizer block) will automatically terminate its transmission of the DS3/E3 AIS indicator, and will permit normal DS3/E3 traffic to pass through the Primary Frame Synchronizer block (towards the down-stream signal path). 0 – Disables the "Transmit AIS (Down-stream) upon LOS feature. 1 – Enables the "Transmit AIS (Down-stream) upon LOS feature.
3	Transmit PDI-P (Down-stream) upon LOF	R/W	**Transmit PDI-P indicator (Down-stream) upon declaration of the DS3/E3 LOF defect condition:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Framer block (via the Primary Frame Synchronizer block) and the Transmit SONET POH Processor block to automatically transmit the PDI-P (Path – Payload Defect Indicator) anytime the LOF defect is declared within the DS3/E3 Ingress Path. More specifically, if this configuration is implemented then the following events will occur. If the Primary Frame Synchronizer block is operating in the "DS3/E3 Ingress" path (e.g., if the DS3/E3 Framer block has been configured to operate in the Frame Generator/Frame Synchronizer Configuration # 0xE6), and if it were to declare the LOF/OOF defect condition (within the Ingress Path), then the corresponding Transmit SONET POH Processor block will automatically transmit the PDI-P indicator (via its STS-1 signal, within the outbound composite STS-3 signal), by setting the C2 byte (within each "down-stream" STS-1 SPE) to the value "0xFC". The Transmit SONET POH Processor block will continue to transmit the PDI-P indicator for the duration that the Primary Frame Synchronizer block declares the LOF defect condition. Once the Primary Frame Synchronizer block clears the LOF defect, then the Transmit SONET POH Processor block will automatically terminate its transmission of the PDI-P indicator by setting the C2 byte (within each "down-stream" STS-1 SPE) to the "0x04". 0 – Disables this "Transmit PDI-P (Down-stream) upon LOF feature. 1 – Enables this "Transmit PDI-P (Down-stream) upon LOF feature. **NOTES:** i. The user should only invoke this feature if the Primary Frame Synchronizer block has been configured to operate in the DS3/E3 Ingress Path. ii. For DS3 Applications, this Automatic Transmission of PDI-P will occur whenever the Primary Frame Synchronizer block declares the OOF defecf condition.

2	Transmit AIS (Down-stream) upon LOF	R/W	**Transmit the DS3/E3 AIS Indicator (Down-stream) upon declaration of the LOF defect condition:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Framer block to do all of the following, if the LOF defect is declared. If the Primary Frame Synchronizer block declares the LOF detect (within its Receive Path) then the AIS/DS3 Idle Signal Pattern Generator (within the Primary Frame Synchronizer block) will automatically transmit the DS3/E3 AIS indicator, via its output Path. In this case, the AIS/DS3 Idle Signal Pattern Generator will transmit the AIS indicator (in the down-stream path) for the duration that the Primary Frame Synchronizer block declares the DS3/E3 LOF defect condition. Once the Primary Frame Synchronizer block clears the LOF/OOF defect condition, then the AIS/DS3 Idle Signal Pattern Generator (within the Primary Frame Synchronizer block) will automatically terminate its transmission of the DS3/E3 AIS indicator, and will permit normal DS3/E3 traffic to pass through the Primary Frame Synchronizer block (towards the down-stream signal path). 0 – Disables the "Transmit AIS (Down-stream) upon LOF feature. 1 – Enables the "Transmit AIS (Down-stream) upon LOF feature.
1	Transmit PDI-P (Down-stream) upon AIS	R/W	**Transmit PDI-P (Down-stream) upon AIS:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Framer block (via the Primary Frame Synchronizer block) and the Transmit SONET POH Processor block to automatically transmit the PDI-P (Path – Payload Defect Indicator) anytime the AIS defect is declared within the DS3/E3 Ingress Path. More specifically, if this configuration is implemented then the following events will occur. If the Primary Frame Synchronizer block is operating in the "DS3/E3 Ingress" path (e.g., if the DS3/E3 Framer block has been configured to operate in Frame Generator/Frame Synchronizer Configuration # 0xE6), and if it were to declare the AIS defect condition (within the Ingress Path), then the corresponding Transmit SONET POH Processor block will automatically transmit the PDI-P indicator, by setting the C2 byte (within each "down-stream" STS-1 SPE) to the value "0xFC". The Transmit SONET POH Processor block will continue to transmit the PDI-P indicator for the duration that the Primary Frame Synchronizer block declares the AIS defect condition. Once the Primary Frame Synchronizer block clears the AIS defect, then the Transmit SONET POH Processor block will automatically terminate its transmission of the PDI-P indicator by setting the C2 byte (within each "down-stream" STS-1 SPE) to the "0x04". 0 – Disables this "Transmit PDI-P (Down-stream) upon AIS feature. 1 – Enables this "Transmit PDI-P (Down-stream) upon AIS feature. **NOTE:** The user should only invoke this feature if the Primary Frame Synchronizer block has been configured to operate in the DS3/E3 Ingress Path.
0	Transmit AIS (Down-stream) upon AIS	R/W	**Transmit the DS3/E3 AIS Indicator (Down-stream) upon declaration of the AIS defect condition:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Framer block to do all of the following, if the AIS defect is declared. If the Primary Frame Synchronizer block declares the AIS detect (within its Receive Path) then the AIS/DS3 Idle Signal Pattern Generator (within the Primary Frame Synchronizer block) will automatically transmit the DS3/E3 AIS indicator, via its output Path. In this case, the AIS/DS3 Idle

			Signal Pattern Generator will transmit the AIS Indicator (in the down-stream path) for the duration that the Primary Frame Synchronizer block declares the DS3/E3 AIS defect condition. Once the Primary Frame Synchronizer block clears the AIS defect condition, then the AIS/DS3 Idle Signal Pattern Generator (within the Primary Frame Synchronizer block) will automatically terminate its transmission of the DS3/E3 AIS indicator, and will permit normal DS3/E3 traffic to pass through the Primary Frame Synchronizer block (towards the down-stream signal path). 0 – Disables the "Transmit AIS (Down-stream) upon AIS feature. 1 – Enables the "Transmit AIS (Down-stream) upon AIS feature.

0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 0	PMON LCV Count Upper Byte[7:0]	RUR	**Performance Monitor- Line Code Violation Count Register – Upper Byte:** These RESET-upon-READ bits along with that within the "PMON Line Code Violation Count – LSB" combine to reflect the cumulative number of Line Code Violations that have been detected by the Primary Frame Synchronizer block, since the last read of this register. This register contains the Most Significant byte of this 16-bit expression. **NOTE:** This register only applies to the Primary Frame Synchronizer block. The Secondary Frame Synchronizer block does not have the ability to detect and flag LCV events.

Table 392: PMON Line Code Violation Count Registers – LSB (Address Location= 0xN351, where N ranges from 0x02 to 0x04)

PMON_Hold_Value[7:0]							
R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 0	PMON Holding Value	R/O	**PMON Holding Value**: These READ-ONLY bit-fields were specifically allocated to support READ operations to the PMON (Performance Monitor) Registers, within the DS3/E3 Framer blocks. Since the PMON Register (within the DS3/E3 Framer block) are 16-bit registers. Therefore, given that the bi-directional data bus of the XRT94L33 is only 8-bits wide, it will require two read operations in order to read out the entire 16 bit content of these registers. The other thing to note is that the PMON Registers (within the DS3/E3 Framer blocks) are RESET-upon-READ type registers. As consequence, the entire 16-bit contents of a given PMON Register will be cleared to “0x0000” immediately after the user has executed the first (of two) read operations to this register. In order to avoid losing the contents of the other byte, the contents of the “un-read” byte is automatically loaded into this register. Hence, once the user reads a register, from a given PMON Register, he/she is suppose to obtain the contents of the other byte, by reading the contents of this register.

Table 404: One Second Error Status Register (Address Location= 0xN36D, where N ranges from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused						Errored Second	Severe Errored Second
R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 2	Unused	R/O	
1	Errored Second	R/O	**Errored Second Indicator:** This READ-ONLY bit-field indicates whether or not the DS3/E3 Framer block has declared the last one-second accumulation period as a "Errored Second". The DS3/E3 Framer block will declare an "errored second" if the Primary Frame Synchronizer block detects any of the following events. *For DS3 Applications* • P-Bit Errors • CP Bit Errors • Framing Bit (F or M bit) Errors *For E3 Applications* • BIP-4/BIP-8 Errors • FAS or Framing Byte (FA1, FA2) Errors 0 – Indicates that the DS3/E3 Framer block has NOT declared the last one-second accumulation period as being an errored second. 1 – Indicates that the DS3/E3 Framer block has declared the last one-second accumulation period as being an errored second. ***Note:*** *This bit-field is only active if the Primary Frame Synchronizer block is enabled.*
0	Severely Errored Second	R/O	**Severely Errored Second Indicator:** This READ-ONLY bit-field indicates whether or not the DS3/E3 Framer block has declared the last one second accumulation period as being a "Severely Errored Second". The DS3/E3 Framer block will declare a given second as being a "severely errored" second if it determines that the BER (Bit Error Rate) during this "one-second accumulation" period is greater than 10^{-3} errors/second. 0 – Indicates that the DS3/E3 Framer block has not declared the last one-second accumulation period as being a "severely-errored" second. 1 – Indicates that the DS3/E3 Framer block has declared the last one-second accumulation period as being a "severely-errored" second. ***Note:*** *This bit-field is only active if the Primary Frame Synchronizer block is enabled.*

7 - 0	One_Second_CP Bit Error Accum_LSB[7:0]	R/O	**One Second CP Bit Error Accumulator Register – LSB:** These READ-ONLY bits, along with that within the "One Second CP-Bit Error Accumulator Register – MSB" combine to reflect the cumulative number of "CP Bit Errors" that have been detected by the Frame Synchronizer block, in the last "one second" accumulation period. This register contains the Least Significant byte of this 16-bit expression. ***Note:*** *This register is inactive if the Primary Frame Synchronizer block is "by-passed" or if the DS3/E3 Framer block has not been configured to operate in the DS3, C-Bit Parity framing format.*

1.10.10 GENERAL PURPOSE I/O PIN CONTROL REGISTERS

Table 411: Line Interface Drive Register (Address Location= 0xN380, where N ranges from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Internal Remote Loop-back	Transmit Frame Pulse Disable	Unused					
R/W	R/O	R/O	R/O	R/O	R/O	R/O	R/O
0	0	0	0	1	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Internal Remote Loop-back	R/W	**Internal Remote Loop-back Mode:** This READ/WRITE bit-field permits the user to configure the DS3/E3 Framer block to operate in the "Remote Loop-back" Mode. If the user enables this feature, then the Receive Input of the Primary Frame Synchronizer block will automatically be routed to the Transmit Output of the Frame Generator block. 0 – Disables the Remote Loop-back Mode. 1 – Enables the Remote Loop-back Mode. ***Note:*** *This feature is only available if both the DS3/E3 Frame Generator and the Primary Frame Synchronizer blocks are enabled.*
6	Transmit Frame Pulse Disable	R/W	**Transmit Frame Pulse Disable:** This READ/WRITE bit-field permits the user to either enable or disable the "Frame Pulse" that is output via the "TxDS3NEG_n" output pin (whenever the XRT94L31 device has been configured to exchange data, with the off-chip DS3/E3/STS-1 LIU) in the Single-Rail manner. 0 – Configures the XRT94L31 device to output a "frame pulse" via the corresponding "TxDS3NEG_n" output pin. 1 – Configures the XRT94L31 device to NOT output a "frame pulse via the "TxDS3NEG_n" output pin. In this case, the chip will pull this output pin "low". ***Note:*** *This bit-field is ignored if the Channel is configured to exchange data (with the off-chip DS3/E3/STS-1 LIU IC) via the Dual-Rail Manner.*
5 - 0	Unused	R/O	

Table 412: Payload HDLC Control Register (Address Location= 0xN382, where N ranges from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Framer Bypass	HDLC On	CRC32	Unused	HDLC LoopBack	Unused		
R/W	R/W	R/W	R/O	R/W	R/O	R/O	R/O
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Framer Bypass	R/W	**Framer Bypass:** This READ/WRITE bit-field permits the user to bypass DS3/E3 framer. 0 – DS3/E3 framer is not bypassed. 1 – DS3/E3 framer is bypassed.
6	HDLC On	R/W	**HDLC on:** This READ/WRITE bit-field permits the user to either disable or enable the Payload HDLC processor. When payload HDLC processor is enabled, the payload portion of the DS3 data stream will come from this HDLC formatter which provides an external byte-wide data (TxHDLCData, from pin STS1TxA_D) and a byte clock (TxHDLCClk, from pin StuffCntl) 0 – Payload HDLC processor is disabled 1 – Payload HDLC processor is enabled
5	CRC32	R/W	**CRC32:** This READ/WRITE bit-field permits the user to select the length of FCS to be 16-bit or 32-bit. If 16-bit FCS is selected, the FCS is calculated with polynomial: $x^{16} + x^{12} + x^5 + 1$. If 32-bit FCS is selected, it is then calculated with polynomial: $x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$ 0 – CRC16 is used 1 – CRC32 is used
4	Unused	R/O	
3	HDLC LoopBack	R/W	**HDLC Loopback:** This READ/WRITE bit-field permits the user to either enable or disable the HDLC loopback. 0 – TxHDLC loopback is disabled. 1 – TxHDLC loopback is enabled. Transmit HDLC processor will loopback to the receive side.
2-0	Unused	R/O

0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 5	Unused	R/O	
4	Primary Frame – Clock Output Invert	R/W	**Primary Frame Synchronizer – Clock Output Invert:** The exact function of this bit-field depends upon whether the Primary Frame Synchronizer Block has been configured to operate in Ingress or Egress Direction, as described below. **If the Primary Frame Synchronizer Block has been configured to operate in the Egress Direction** This READ/WRITE bit-field permits the user to configure the Primary Frame Synchronizer block to update the "TxDS3POS_n/TxDS3NEG_n" output pins upon either the rising or falling edge of "TxDS3LineClk_n. 0 – "TxDS3POS_n/TxDS3NEG_n is updated upon the rising edge of "TxDS3LineClk_n". The user should insure that the LIU IC will sample the "TxDS3POS_n/TxDS3NEG_n" input pins upon the falling edge of "TxDS3LincClk_n" 1 – "TxDS3POS_n/TxDS3NEG_n" is updated upon the falling edge of "TxDS3LineClk_n". The user should insure that the LIU IC will sample the "TxDS3POS_n/TxDS3NEG_n" input pins upon the rising edge of "TxDS3LineClk_n". **If the Primary Frame Synchronizer Block has been configured to operate in the Ingress Direction:** This READ/WRITE bit-field permis the user to configure the Primary Frame Synchronizer block to update the "Ingress Direction" DS3/E3 data-stream (which is being routed to the DS3/E3 Mapper block) upon either the rising or falling edge of the Recovered Line (Ingress Direction) DS3/E3 Clock signal (from the LIU IC). 0 – "Ingress Direction DS3/E3 Data" is updated upon the rising edge of the "Recovered" Clock Signal. 1 – "Ingress Direction DS3/E3 Data" is updated upon the falling edge of the "Recovered" Clock Signal. **NOTE:** If the Primary Frame Synchronizer block is configured to operate in the Ingress Direction, then we recommend that the user set this register bit to "1". This setting will insure that the DS3/E3 Mapper block will be able to sample the Ingress Direction DS3/E3 data-stream with proper set-up and hold times.
3	Primary Frame – Transmit AIS Enable	R/W	**Primary Frame Synchronizer Block – Transmit AIS Enable:** This READ/WRITE bit-field permits the user to configure the AIS/DS3 Idle Pattern Generator, within the Primary Frame Synchronizer block to transmit the DS3/E3 AIS indicator to the remote terminal equipment (per Software

			Command). If the user commands the "AIS/DS3 Idle Signal Pattern Generator", to generate and transmit the DS3/E3 AIS pattern, then the data, that is output via the Primary Frame Synchronizer block, will be overwritten with this DS3/E3 AIS Pattern. 0 –Disables the "AIS/DS3 Idle Signal Pattern Generator" within the Primary Frame Synchronizer block. In this setting, normal traffic will pass through the Primary Frame Synchronizer block 1 – Configures the "AIS/DS3 Idle Signal Pattern Generator" (within the Primary Frame Synchronizer block) to generate and transmit the DS3/E3 AIS indicator.
2	Secondary Frame – Single-Rail Input	R/W	**Secondary Frame Synchronizer Block –Single-Rail/Dual Rail Input Select:** This READ/WRITE bit-field permits the user to configure the Secondary Frame Synchronizer block to accept data via either the "Single-Rail" or "Dual-Rail" manner. 0 – Configures the Secondary Frame Synchronizer block to accept data via the "Dual-Rail" Mode. 1 – Configures the Secondary Frame Synchronizer block to accept data via the "Single-Rail" Mode. ***Note:*** *This register bit is only valid if the Secondary Frame Synchronizer block has been configured to operate in the "Ingress" Direction.*
1	Primary Frame – Dual-Rail Output	R/W	**Primary Frame Synchronizer – Dual-Rail Output:** This READ/WRITE bit-field permits the user configure the Primary Frame Synchronizer block to output data (to the LIU IC) in either the Single-Rail or Dual-Rail Manner. 0 – Configures the Primary Frame Synchronizer block to output data (to the LIU IC) in a Single-Rail Manner. 1 – Configures the Primary Frame Synchronizer block to output data (to the LIU IC) in a Dual-Rail Manner. ***Note:*** *This register bit is only valid if the Primary Frame Synchronizer block has been configured to operate in the "Egress" Direction.*
0	Primary Frame – Idle Pattern Insert	R/O	**Primary Frame Synchronizer Block – DS3 Idle Pattern Insert:** This READ/WRITE bit-field permits the user to configure the AIS/DS3 Idle Signal Pattern Generator, within the Primary Frame Synchronizer block to transmit the DS3 Idle signal to the remote terminal equipment (per Software Command). If the user commands the "AIS/DS3 Idle Signal Pattern Generator" to generate and transmit the DS3 Idle Signal pattern, then the data, that is output via the Primary Frame Synchronizer block, will be overwritten with the DS3 Idle Signal Pattern. 0 –Disables the "AIS/DS3 Idle Signal Pattern Generator" within the Primary Frame Synchronizer block. In this setting, normal traffic will pass through the Primary Frame Synchronizer block 1 – Configures the "AIS/DS3 Idle Signal Pattern Generator" (within the Primary Frame Synchronizer block) to generate and transmit the DS3 Idle Signal.

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	F2 Byte Insertion Type	R/W	**F2 Byte Insertion Type:** This READ/WRITE bit-field permits the user to configure the Transmit SONET POH Processor block to use either the contents within the "Transmit SONET Path – Transmit F2 Byte Value" Register or the TPOH input pin as the source for the F2 byte, in the outbound STS-1 SPE data-stream, as described below. 0 – Configures the Transmit SONET POH Processor block to insert the contents within the "Transmit SONET Path – Transmit F2 Byte Value" Register into the F2 Byte position within each outbound STS-1 SPE. 1 – Configures the Transmit SONET POH Processor block to accept externally supplied data (via the "TPOH" input port) and to insert this data into the F2 byte position within each outbound STS-1 SPE. ***NOTE:*** *The Address Location of the Transmit SONET POH Processor block – Transmit F2 Byte Value Register is 0xN9A3.*
6 - 5	REI-P Insertion Type[1:0]	R/W	**REI-P Insertion Type[1:0]:** These two READ/WRITE bit-fields permit the user to configure the Transmit SONET POH Processor block to use one of the three following sources for the REI-P bit-fields (e.g., bits 1 through 4, within the G1 byte of the outbound STS-1 SPE). • From the corresponding Receive SONET POH Processor block (e g., the Transmit SONET POH Processor block will set the REI-P bit-fields to the appropriate value, based upon the number B3 byte errors that the corresponding Receive SONET POH Processor block detects and flags, within its incoming STS-1 SPE data-stream). • From the "Transmit G1 Byte Value" Register. In this case, the Transmit SONET POH Processor block will insert the contents of Bits 7 through 4 within the "Transmit SONET POH Processor block – Transmit G1 Byte Value" Register into the REI-P bit-fields within each outbound STS-1 SPE. • From the "TPOH" input pin. In this case, the Transmit SONET POH Processor block will accept externally supplied data (via the "TPOH" input port) and it will insert this data into the REI-P bit-fields within each outbound STS-1 SPE. 00/11 – Configures the Transmit SONET POH Processor block to set Bits 1 through 4 (in the G1 byte of the outbound SPE) based upon the number of B3 byte errors that the corresponding Receive SONET POH Processor block detects and flags within the incoming STS-1 data-stream. 01 – Configures the Transmit SONET POH Processor block to set Bits 1 through 4 (in the G1 byte of the outbound SPE) based upon the contents within the "Transmit SONET POH Processor block - Transmit G1 Byte Value" register. 10 – Configures the Transmit SONET POH Processor block to accept

			externally supplied data (via the TPOH input port) and to insert this data into the REI-P bit-positions within each outbound STS-1 SPE. ***NOTE:*** *The Address location of the Transmit SONET POH Processor block – Transmit G1 Byte Value Register is 0xN99F*.
4 - 3	RDI-P Insertion Type[1:0]	R/W	**RDI-P Insertion Type[1:0]:** These two READ/WRITE bit-fields permit the user to configure the Transmit SONET POH Processor block to use one of the three following sources for the RDI-P bit-fields (e.g., bits 5 through 7, within the G1 byte of the outbound STS-1 SPE). • From the corresponding Receive SONET POH Processor block (e g., when it detects various defect conditions within its incoming SPE data). • From the "Transmit G1 Byte Value" Register (Address Location= 0xN99F). • From the "TPOH" input pin. 00/11 – Configures the Transmit SONET POH Processor block to set Bits 5 through 7 (in the G1 byte of the outbound SPE) to the appropriate value coincident to whenever the Receive SONET POH Processor block declares any defect conditions" within the incoming STS-1 data-stream.. 01 – Configures the Transmit SONET POH Processor block to set Bits 5 through 7 (in the G1 byte of the outbound SPE) based upon the contents within the "Transmit G1 Byte Value" register. 10 – Configures the Transmit SONET POH Processor block to use the TPOH input pin as the source of Bits 5 through 7 (in the G1 byte of the outbound SPE).
2	C2 Byte Insertion Type	R/W	**C2 Insertion Type:** This READ/WRITE bit-field permits the user to configure the Transmit SONET POH Processor block to use either the "Transmit SONET Path – Transmit C2 Value" Register or the TPOH input pin as the source for the C2 byte, in the outbound STS-1 SPE data-stream. 0 – Configures the Transmit SONET POH Processor block to use the "Transmit SONET Path – Transmit C2 Value" Register (Address Location= 0xN99B). 1 – Configures the Transmit SONET POH Processor block to use the "TPOH" input as the source for the C2 byte, in the outbound STS-1 SPE.
1	Auto-Insert PDI-P Indicator Enable	R/W	**Auto-Insert PDI-P Indicator Enable:** This READ/WRITE bit-field permit the user to configure the Transmit SONET POH Processor block to automatically transmit the PDI-P (Path - Payload Defect Indicator) whenever the DS3/E3 Framer block declares an LOS, OOF or AIS condition. If this feature is enabled, then the Transmit SONET POH Processor block will automatically set the C2 byte (within the outbound SPE) to 0xFC (to indicate a PDI-P condition) whenever the DS3/E3 Framer block declares the LOS, OOF or AIS condition. 0 – Disables the "Auto-Insert PDI-P" feature. 1 – Enables the "Auto-Insert PDI-P" feature. NOTE: This bit-field is only value if the DS3/E3 Framer block (within the corresponding Channel) has been enabled.
0	Transmit AIS-P Enable	R/W	**Transmit AIS-P Enable:** This READ/WRITE bit-field permits the user to configure the Transmit SONET POH Processor block to (via software control) transmit an AIS-P

			indicator to the remote PTE. If this feature is enabled, then the Transmit SONET POH Processor block will unconditionally set the H1, H2, H3 and all the SPE bytes to an “All Ones” pattern, prior to routing this data to the Transmit STS-3 TOH Processor block. 0 – Configures the Transmit SONET POH Processor block to NOT transmit the AIS-P indicator to the remote PTE. 1 – Configures the Transmit SONET POH Processor block to transmit the AIS-P indicator to the remote PTE. NOTE: For normal operation, the user should set this bit-field to “0”.

Table 422: Transmit SONET Path – Transmitter J1 Byte Value Register (Address Location= 0xN993, where N ranges in value from 0x02 to 0x04)

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 0	Transmit Z5 Byte Value[7:0]	R/W	**Transmit Z5 Byte Value:** These READ/WRITE bit-fields permit the user to have software control over the value of the Z5 byte, within each outbound STS-1 SPE. If the user configures the Transmit SONET POH Processor block to this register as the source of the Z5 byte, then it will automatically write the contents of this register into the Z5 byte location, within each "outbound" STS-1 SPE. This feature is enabled whenever the user writes a "0" into Bit 3 (Z5 Insertion Type) within the "Transmit SONET Path – SONET Control Register – Byte 0" register (Address Location= 0xN982).

Table 432: Transmit SONET Path – Transmit Path Control Register (Address Location= 0xN9B7, where N ranges in value from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused		Pointer Force	Check Stuff	Insert Negative Stuff	Insert Positive Stuff	Insert Continuous NDF Events	Insert Single NDF Event
R/O	R/O	R/W	R/W	W	W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 6	Unused	R/O	
5	Pointer Force	R/W	**Pointer Force:** This READ/WRITE bit-field permits the user to load the values contained within the "Transmit SONET POH Arbitrary H1 Pointer" and "Transmit SONET POH Arbitrary H2 Pointer" registers (Address Location= 0xN9BF and 0xN9C3) into the H1 and H2 bytes (within the outbound STS-1 data stream). ***Note:*** *The actual location of the SPE will NOT be adjusted, per the value of H1 and H2 bytes. Hence, this feature should cause the remote terminal to declare an "Invalid Pointer" condition.* 0 – Configures the Transmit SONET POH and Transmit STS-3 TOH Processor blocks to transmit STS-1/STS-3 data with normal and correct H1 and H2 bytes. 1 – Configures the Transmit SONET POH and Transmit STS-3 TOH Processor blocks to overwrite the values of the H1 and H2 bytes (in the outbound STS-1/STS-3 data-stream) with the values in the "Transmit SONET POH Arbitrary H1 and H2 Pointer" registers.
4	Check Stuff	R/W	**Check Stuff Monitoring:** This READ/WRITE bit-field permits the user to configure the Transmit SONET POH and Transmit STS-3 TOH Processor blocks to only execute a "Positive", "Negative" or "NDF" event (via the "Insert Positive Stuff", "Insert Negative Stuff", "Insert Continuous or Single NDF" options, via software command) if no pointer adjustment (NDF or otherwise) has occurred during the last 3 SONET frame periods. 0 – Disables this feature. In this mode, the Transmit SONET POH and Transmit STS-3 TOH Processor blocks will execute a "software-commanded" pointer adjustment event, independent of whether a pointer adjustment event has occurred in the last 3 SONET frame periods. 1 – Enables this feature. In this mode, the Transmit SONET POH and Transmit STS-3 TOH Processor blocks will ONLY execute a "software-commanded" pointer adjustment event, if no pointer adjustment event has occurred during the last 3 SONET frame periods.
3	Insert Negative Stuff	R/W	**Insert Negative Stuff:** This READ/WRITE bit-field permits the user to configure the Transmit SONET POH and Transmit STS-3 TOH Processor blocks to insert a negative-stuff into the outbound STS-1/STS-3 data stream. This command, in-turn will cause a "Pointer Decrementing" event at the remote terminal. Writing a "0" to "1" transition into this bit-field causes the following to

			happen. • A negative-stuff will occur (e.g., a single payload byte will be inserted into the H3 byte position within the outbound STS-1/STS-3 data stream). • The "D" bits, within the H1 and H2 bytes will be inverted (to denote a "Decrementing" Pointer Adjustment event). • The contents of the H1 and H2 bytes will be decremented by "1", and will be used as the new pointer from this point on. ***Note:*** *Once the user writes a "1" into this bit-field, the XRT94L33 will automatically clear this bit-field. Hence, there is no need to subsequently reset this bit-field to "0".*
2	Insert Positive Stuff	R/W	**Insert Positive Stuff:** This READ/WRITE bit-field permits the user to configure the Transmit SONET POH and Transmit STS-3 TOH Processor blocks to insert a positive-stuff into the outbound STS-1/STS-3 data stream. This command, in-turn will cause a "Pointer Incrementing" event at the remote terminal. Writing a "0" to "1" transition into this bit-field causes the following to happen. • A positive-stuff will occur (e.g., a single stuff-byte will be inserted into the STS-1/STS-3 data-stream, immediately after the H3 byte position within the outbound STS-1/STS-3 data stream). • The "I" bits, within the H1 and H2 bytes will be inverted (to denote a "Incrementing" Pointer Adjustment event). • The contents of the H1 and H2 bytes will be incremented by "1", and will be used as the new pointer from this point on. ***Note:*** *Once the user writes a "1" into this bit-field, the XRT94L33 will automatically clear this bit-field. Hence, there is no need to subsequently reset this bit-field to "0".*
1	Insert Continuous NDF Events	R/W	**Insert Continuous NDF Events:** This READ/WRITE bit-field permits the user configure the Transmit SONET POH and Transmit STS-3 TOH Processor blocks to continuously insert a New Data Flag (NDF) pointer adjustment into the outbound STS-1/STS-3 data stream. ***Note:*** *As the Transmit SONET POH and Transmit STS-3 TOH Processor blocks insert the NDF event into the STS-1/STS-3 data stream, it will proceed to load in the contents of the "Transmit SONET POH Arbitrary H1 Pointer" and "Transmit SONET POH Arbitrary H2 Pointer" registers into the H1 and H2 bytes (within the outbound STS-1/STS-3 data stream).* 0 – Configures the "Transmit SONET TOH and Transmit STS-3 POH Processor" blocks to not continuously insert NDF events into the "outbound" STS-1/STS-3 data stream. 1- Configures the "Transmit SONET TOH and Transmit STS-3 POH Processor" blocks to continuously insert NDF events into the "outbound" STS-1/STS-3 data stream.
0	Insert Single NDF Event	R/W	**Insert Single NDF Event:** This READ/WRITE bit-field permits the user to configure the Transmit SONET POH and Transmit STS-3 TOH Processor blocks to insert a New Data Flag (NDF) pointer adjustment into the outbound STS-1/STS-3 data stream. Writing a "0" to "1" transition into this bit-field causes the following to happen.

			• The "N" bits, within the H1 byte will set to the value "1001" • The ten pointer-value bits (within the H1 and H2 bytes) will be set to new pointer value per the contents within the "Transmit SONET POH – Arbitrary H1 Pointer" and "Transmit SONET POH Arbitrary H2 Pointer" registers (Address Location= 0xN9BF and 0xN9C3). • Afterwards, the "N" bits will resume their normal value of "0110"; and this new pointer value will be used as the new pointer from this point on. ***Note:*** *Once the user writes a "1" into this bit-field, the XRT94L33 will automatically clear this bit-field. Hence, there is no need to subsequently reset this bit-field to "0".*

Table 433: Transmit SONET Path – Transmit Path Trace Message Control Register (Address Location= 0xN9BB, where N ranges in value from 0x02 to 0x04)

1.12.1 DS3/E3 MAPPER BLOCK CONTROL REGISTER DESCRIPTION

Table 443: Mapper Control Register – Byte 2 (Address Location= 0xNB01, where N ranges from 0x02 to 0x04)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
STS-1 POH Pass Thru	STS-1 Remote Loop-back	STS-1 Local Loop-back	STS-1 TOH Insert	Loop-Timing	STS-3 POH Pass Thru	Receive (Ingress) STS-1 Enable	Transmit (Egress) STS-1 Enable
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	STS-1 POH Pass Thru	R/W	**STS-1 POH (Path Overhead) Pass-Thru:** This READ/WRITE bit-field permits the user to configure the Transmit STS-1 circuitry (within this particular channel) to operate in the "STS-1 POH Pass-Thru" Mode. If the user configures the Channel to operate in the "STS-1 POH Pass-Thru" Mode, then the Transmit (or Egress Direction) STS-1 circuitry will use the "upstream" Receive SONET POH Processor block as the source for the POH bytes within each outbound STS-1 SPE. In the "STS-1 POH Pass Thru" Mode, the Transmit STS-1 POH Processor block will be disabled and will NOT assume the responsibility for computing and inserting the POH byte values into the "POH byte-positions" within the "Transmit (or Egress Direction) STS-1 SPEs. The POH bytes (within these STS-1 SPEs) will pass from the Receive SONET POH Processor block to the Transmit STS-1 TOH Processor block without modification. If the user does NOT configure the Transmit STS-1 circuitry to operate in the "STS-1 POH Pass-Thru" Mode, then the POH bytes (within these STS-1 SPEs) will undergo "modification" as they pass from the Receive SONET POH Processor block to the Transmit STS-1 TOH Processor block (via the Transmit STS-1 POH Processor block). 0 – Configures the Transmit STS-1 circuitry to NOT operate in the "STS-1 POH Pass-Thru" Mode. 1 – Configures the Transmit STS-1 circuitry to operate in the "STS-1 POH Pass-Thru" Mode. **NOTES:** **1.** *The "STS-1 POH Pass-Thru" Mode will be disabled, if the channel is configured to operate in the Loop-Timing Mode.* *2. The "STS-1 POH Pass-Thru" Mode is very useful for those applications in which the XRT94L33 device is handling STS-1 data-stream that is transporting VT-Mapped T1/E1 data-streams (in which it is imperative that the user retain the value of the H4 byte).* *3. This register bit is only active if a given channel (on the "Slow-Speed" Side of the XRT94L33 device) has been configured to operate in the STS-1 Mode. This register bit is NOT active if a given channel has been configured to operate in the DS3/E3 Mode.*
6	STS-1 Remote Loop-back	R/W	**STS-1 Remote Loop-back Operation:** This READ/WRITE bit-field permits the user to configure the Channel to operate in the Remote Loop-back Mode. 0 – No Loop-back Mode 1 – Remote Loop-back Mode

			In this case, the Receive (Ingress) STS-1 signal will be looped back out into the Transmit (Egress) STS-1 signal path.
5	STS-1 Local Loop-back	R/W	**STS-1 Local Loop-back Operation:** This READ/WRITE bit-field permits the user to configure the Channel to operate in the Local Loop-back Mode. 0 – No Loop-back Mode. 1 – Local Loop-back Mode In this case, the Transmit (Egress) STS-1 signal will be looped back into the Receive (Ingress) STS-1 signal path.
4	STS-1 TOH Insert	R/W	**STS-1 TOH (Transport Overhead) Insert:** This READ/WRITE bit-field permits the user to configure each Transmit STS-1 TOH Processor block to accept its TOH data from the "TxPOH" input pins. 0 – Disables this feature. 1 – Enables this feature. ***Note:*** *The user must also configure the Transmit Section of a given Channel to operate in the STS-1 Mode, by setting Bit 0 (Transmit Egress STS-1 Enable) to "1".*
3	Loop-Timing	R/W	**Loop-Timing Mode:** This READ/WRITE bit-field permits the user to configure the Transmit STS-1 circuitry (e.g., the Transmit STS-1 POH and TOH Processor blocks) to operate in the Loop-Timing Mode. If the user opts to configure the Transmit STS-1 circuitry (within this particular channel) to operate in the loop-timing mode, then the Transmit STS-1 circuitry will use the recovered clock signal (within the corresponding Receive STS-1 TOH and POH Processor blocks) as its timing reference. If the user opts to NOT configure the Transmit STS-1 circuitry into the "loop-timing" mode, then the Transmit STS-1 circuitry will use a 51.84MHz clock signal (that is ultimately derived from the 155.52MHz or 19.44MHz clock signal, that is being applied to the Receive STS-3 PECL Interface or Receive STS-3 Telecom Bus Interface block) as its timing source 0 – Configures the Transmit STS-1 TOH and POH Processor blocks to operate in the "Local-Timing" Mode. 1 – Configures the Transmit STS-1 TOH and POH Processor blocks to operate in the Loop-Timing Mode
2	STS-3 POH Pass-Thru	R/W	**STS-3 POH (Path Overhead) Pass-Thru:** This READ/WRITE bit-field permits the user to configure the Transmit STS-3 circuitry (within this particular channel) to operate in the "STS-3 POH Pass-Thru" Mode. If the user configures the Channel to operate in the "STS-3 POH Pass-Thru" Mode, then the Transmit STS-3 circuitry will use the (upstream) Receive STS-1 POH Processor block as the source for the POH bytes within each outbound STS-1 SPE. In the "STS-3 POH Pass Thru" Mode, the Transmit SONET POH Processor block will be disabled and will NOT assume the responsibility for computing and iinserting the POH byte values into the "POH byte-positions" within these "Transmit STS-3 TOH Processor-block desitined" STS-1 SPEs. The POH bytes (within these STS-1 SPEs) will pass from the Receive STS-1 POH Processor block to the Transmit STS-3 TOH Processor block without modification. If the user does NOT configure the Transmit STS-3 circuitry to operate in the "STS-3 POH Pass-Thru" Mode, then the POH bytes (within these STS-1 SPEs) will undergo "modification" as they pass from the Receive STS-1 POH Processor block to the Transmit STS-3 TOH Processor block (via the

			Transmit SONET POH Processor block). 0 – Configures the Transmit STS-3 circuitry to NOT operate in the "STS-3 POH Pass-Thru" Mode. 1 – Configures the Transmit STS-3 circuitry to operate in the "STS-3 POH Pass-Thru" Mode. **NOTES:** 1. *The "STS-3 POH Pass-Thru" Mode is very useful for those applications in which the XRT94L33 device is handling STS-1 data-stream that is transporting VT-Mapped T1/E1 data-streams (in which it is imperative that the user retain the value of the H4 byte).* 2. *This register bit is only active if a given channel (on the "Slow-Speed" side of the XRT94L33 device) has been configured to operate in the STS-1 Mode. This register bit is NOT active if a given channel has been configured to operate in the DS3/E3 Mode.*
1	Receive (Ingress) STS-1 Enable	R/W	**Receive (Ingress) STS-1 Enable:** This READ/WRITE bit-field permits the user to configure the Ingress path (of the channel) to operate in either the STS-1 Mode, or in the DS3/E3 Mode. 0 – Ingress Direction of Channel will operate in the DS3/E3 Mode. 1 – Ingress Direction of Channel will operate in the STS-1 Mode.
0	Transmit (Egress) STS-1 Enable	R/W	**Transmit (Egress) STS-1 Enable:** This READ/WRITE bit-field permits the user to configure the Egress path (of the channel) to operate in either the STS-1 Mode, or in the DS3/E3 Mode. 0 – Egress Direction of Channel will operate in the DS3/E3 Mode 1 – Egress Direction of Channel will operate in the STS-1 Mode.

Table 444: Mapper Control Register – Byte 1 (Address Location= 0xNB02)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0

0	0	0	0	0	1	1	1

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 4	Unused	R/O	
3	STS-1 CLK_IN Invert (Ingress Direction)	R/W	**STS-1 CLK_IN Invert (Ingress Direction):** This READ/WRITE bit-field permits the user to configure the DS3/E3 Mapper Block (of Channel n), within the XRT94L33; to sample and latch the "RxDS3POS_n" input pins (pin B14. C21. AG15) upon either the rising or falling edge of "RxDS3LineClk_n" (pin D14, A24, AF14). 0 – "RxDS3POS_n" is sampled upon the falling edge of the "RxDS3LineClk_n". 1 – "RxDS3POS_n" is sampled upon the rising edge of the "RxDS3LineClk_n"
2	STS-1 CLK_OUT Invert (Egress Direction)	R/W	**STS-1 CLK_OUT Invert (Egress Direction):** This READ/WRITE bit-field permits the user to configure the DS3/E3 Mapper block (of Channel n), within the XRT94L33, to update the "TxDS3POS_n" output pins (pin B18, G24, AG9) upon either the rising or falling edge of the "TxDS3LineClk_n" (pin C17, E25, AF10) 0 – "TxDS3POS_n" is updated upon the rising edge of "TxDS3LineClk_n". The user should insure that the LIU IC will sample the output data upon the falling edge of the "TxDS3LineClk_n" 1 – "TxDS3POS_n" is updated upon the falling edge of "TxDS3LineClk_n". The user should insure that the LIU IC will sample the output data upon the rising edge of "TxDS3LineClk_n" ***Note:*** *This bit-field is only active if the DS3/E3 Mapper block has been configured to operate in the Egress Path.*
1	Default R	R/W	**Default R Value:** When a DS3 signal is mapped into a STS-1 SPE (in SONET) or a VC-3 (in SDH), there are numerous bits that are also stuffed into the STS-1 SPE or the VC-3 in order to accommodate the frequency differences between DS3 and an STS-1 SPE or an SDH VC-3. One such bit is referred to as an "R" bit. Currently, the standards do not define a "use" for these bits. Hence, this bit can be used as a proprietary communication link between two pieces of equipment. This READ/WRITE bit-field permits the user to set the value for the "R" bits in the outbound STS-1 SPE or SDH VC-3. ***Note:*** *The XRT94L33 includes a corresponding "READ-ONLY" register bit, in which one can obtain the value for the "R" bits in the incoming STS-1 SPE or SDH VC-3. This register bit is located in Bit 1 (Received R) within the "Receive Mapper Status Register – Byte 1(Address Location= 0xNB06).*

0	Default O	R/W	**Default O Value:** When a DS3 signal is mapped into a STS-1 SPE (in SONET) or a VC-3 (in SDH), there are numerous bits that are also stuffed into the STS-1 SPE or the VC-3 in order to accommodate the frequency differences between DS3 and an STS-1 SPE or an SDH VC-3. One such bit, is referred to as an "O" bit. Currently, the standards do not define a "use" for these bits. Hence, this bit can be used as a proprietary communication link between two pieces of equipment. This READ/WRITE bit-field permits the user to set the value for the "O" bits in the outbound STS-1 SPE or SDH VC-3. ***Note:*** *The XRT94L33 includes a corresponding "READ-ONLY" register bit, in which one can obtain the value for the "O" bits in the incoming STS-1 SPE or SDH VC-3. This register bit is located in Bit 0 (Received O) within the "Receive Mapper Status Register – Byte 1 (Address Location= 0xNB06).*

Table 445: Mapper Control Register – Byte 0 (Address Location= 0xNB03)

1	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	JA_RESET*	R/W	**JA FIFO RESET:** A "1" to "0" transition, within this bit-field commands the FIFO_READ and FIFO_WRITE pointers (within the Jitter Attenuator FIFO) to be reset to their default positions. ***Note:*** *After the user has commanded the RESET to the Jitter Attenuator circuit, the user must set this bit-field back to "1" in order to permit proper operation.*
6 - 3	Unused	R/O	
2	Level 2 Monitor	R/W	**Level 2 Monitor Enable:** This READ/WRITE bit-field permits the user to enable the "Level 2" feature, within the DS3/E3 Mapper Block. If the user enables this feature, then the Channel will perform "Performance Monitoring" of the DS3 data, being carried by the Receive (or Ingress) STS-1 signal. The location of this monitoring will be between the Receive STS-1 TOH Processor block and the Receive STS-1 POH Processor block. This STS-1 signal will still proceed onto the "Receive STS-1 POH Processor" block, intact. 0 – Disables the Level 2 Monitor Feature. 1 – Enables the Level 2 Monitor Feature. ***Note:*** *This feature is only useful if the Ingress STS-1 signal is carrying a DS3 signal. This feature would not be of any use if the STS-1 signal were carrying VT-mapped DS1 or E1 signals, for instance.*
1	Unused	R/O	
0	Jitter Attenuator Enable	R/W	**Jitter Attenuator Enable:** These two READ/WRITE bit-fields permits the user to either enable or disable the Jitter Attenuator circuit within the Mapper Block, as indicated below. 0 – Disables the Jitter Attenuator circuit. 1 – Enables the Jitter Attenuator circuit.

7 - 2	Unused	R/O	
1	Received R	R/W	**Incoming "R" Value:** When a DS3 signal is de-mapped from an STS-1 SPE (in SONET) or a VC-3 (in SDH), there are numerous bits that were also stuffed into the STS-1 SPE or the VC-3 in order to accommodate the frequency differences between DS3 and an STS-1 SPE or an SDH VC-3. One such bit is referred to as an "R" bit. Currently, the standards do not define a "use" for these bits. Hence, this bit can be used as a proprietary communication link between two pieces of equipment. This READ-ONLY bit-field contains the value of the "R" bits within the most recently received STS-1 SPE or SDH VC-3. ***Note:*** *The XRT94L33 includes a corresponding "READ/WRITE" register bit, in which one can set the value for the "R" bits, in the "outbound" STS-1 SPE or SDH VC-3. This register bit is located in Bit 1 (Default R) within the "Mapper Control Register – Byte 1" (Address Location= 0xNB02)*
0	Received O	R/W	**Incoming "O" Value:** When a DS3 signal is de-mapped from an STS-1 SPE (in SONET) or a VC-3 (in SDH), there are numerous bits that were also stuffed into the STS-1 SPE or the VC-3 in order to accommodate the frequency differences between DS3 and an STS-1 SPE or an SDH VC-3. One such bit is referred to as an "O" bit. Currently, the standards do not define a "use" for these bits. Hence, this bit can be used as a proprietary communication link between two pieces of equipment. This READ-ONLY bit-field contains the value of the "O" bits within the most recently received STS-1 SPE or SDH VC-3. ***Note:*** *The XRT94L33 includes a corresponding "READ/WRITE" register bit, in which one can set the value for the "R" bits, in the "outbound" STS-1 SPE or SDH VC-3. This register bit is located in Bit 1 (Default R) within the "Mapper Control Register – Byte 1" (Address Location= 0xNB02)*

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Receive STS-1 Overrun Indicator	R/O	**Receive STS-1 Overrun Indicator:** This READ-ONLY bit-field indicates whether or not the Channel is declaring a "Receive STS-1 Overrun" Condition. A "Receive STS-1 Overrun" condition will only occur if data is arriving into the Receive STS-1 POH Processor blocks at a much faster rate, than that being removed, by the Transmit SONET POH Processor block. 0 – Indicates that the Channel is NOT declaring the "Receive STS-1 Overrun" condition. 1 – Indicates that the Channel is currently declaring the "Receive STS-1 Overrun" condition. ***Note:*** *1. There will invariably be a timing mismatch between the clock signal driving the Receive STS-1 POH Processor block (e.g., the Recovered clock signal from the LIU IC) and the Transmit SONET POH Processor block (which is derived from the Clock Synthesizer block). Minor timing differences are easily handled by pointer adjustments.* *2. This condition will only occur if there is a major timing mismatch between the two clock signals. This condition can be viewed as an indicator of a fault condition within the source(s) of one of these clock signals.*
6	Receive STS-1 Underrun Indicator	R/O	**Receive STS-1 Underrun Indicator:** This READ-ONLY bit-field indicates whether or not the Channel is declaring a "Receive STS-1 Underrun" Condition. A "Receive STS-1 Underrun" condition will only occur if data is arriving into the Receive STS-1 POH Processor blocks at a much slower rate, than that being removed, by the Transmit SONET POH Processor block. 0 – Indicates that the Channel is NOT declaring the "Receive STS-1 Underrun" condition. 1 – Indicates that the Channel is currently declaring the "Receive STS-1 Underrun" condition. ***Note:*** *1. There will invariably be a timing mismatch between the clock signal driving the Receive STS-1 POH Processor block (e.g., the Recovered clock signal from the LIU IC) and the Transmit SONET POH Processor block (which is derived from the Clock Synthesizer block). Minor timing differences are easily handled by pointer adjustments.* *2. This condition will only occur if there is a major timing mismatch between the two clock signals. This condition can be viewed as an indicator of a fault condition within the source(s) of one of these clock signals*.

5	Transmit STS-1 Overrun Indicator	R/O	**Transmit STS-1 Overrun Indicator:** This READ-ONLY bit-field indicates whether or not the Channel is declaring a "Transmit STS-1 Overrun" Condition. A "Transmit STS-1 Overrun" condition will only occur if data is arriving into the Receive SONET POH Processor blocks at a much faster rate, than that being removed, by the Transmit STS-1 POH Processor block. 0 – Indicates that the Channel is NOT declaring the "Transmit STS-1 Overrun" condition. 1 – Indicates that the Channel is currently declaring the "Transmit STS-1 Overrun" condition. ***Note:*** *1. In most applications of the XRT94L33 there will typically not be a timing mismatch between the clock signal driving the Transmit STS-1 POH Processor block and the Receive SONET POH Processor block (each of these blocks are typically driving by a clock signal which is derived from the Receive STS-3 Clock signal).* *However, timing differences can exist if the Channel is configured to operate in the Loop-Timing Mode.* *2. Minor timing differences are easily handled by pointer adjustments.* *3. This condition will only occur if there is a major timing mismatch between the two clock signals. This condition can be viewed as an indicator of a fault condition within the source(s) of one of these clock signals*.
4	Transmit STS-1 Underrun Indicator	R/O	**Transmit STS-1 Underrun Indicator:** This READ-ONLY bit-field indicates whether or not the Channel is declaring a "Transmit STS-1 Underrun" Condition. A "Transmit STS-1 Underrun" condition will only occur if data is arriving into the Receive SONET POH Processor blocks at a much slower rate, than that being removed, by the Transmit STS-1 POH Processor block. 0 – Indicates that the Channel is NOT declaring the "Transmit STS-1 Underrun" condition. 1 – Indicates that the Channel is currently declaring the "Transmit STS-1 Underrun" condition. ***Note:*** *1. In most applications of the XRT94L33 there will typically not be a timing mismatch between the clock signal driving the Transmit STS-1 POH Processor block and the Receive SONET POH Processor block (each of these blocks are typically driving by a clock signal which is derived from the Receive STS-3 Clock signal).* *However, timing differences can exist if the Channel is configured to operate in the Loop-Timing Mode.* *2. Minor timing differences are easily handled by pointer adjustments.* *3. This condition will only occur if there is a major timing mismatch between the two clock signals. This condition can be viewed as an indicator of a fault condition within the source(s) of one of these clock signals.*
3	Receive DS3/E3 Overrun Indicator	R/O	**Receive DS3/E3 Overrun Indicator:** This READ-ONLY bit-field indicates whether or not the Channel is declaring a "Receive DS3/E3 Overrun" Condition. A "Receive DS3/E3 Overrun" condition will only occur if data is arriving into the DS3/E3 Framer block (in the Ingress Direction) at a much faster rate, than that

			being removed, by the Transmit SONET POH Processor block. 0 – Indicates that the Channel is NOT declaring the "Receive DS3/E3 Overrun" condition. 1 – Indicates that the Channel is currently declaring the "Receive DS3/E3 Overrun" condition. ***Note:*** *1. There will invariably be a timing mismatch between the clock signal driving the Ingress Direction of the DS3/E3 Framer block (e.g., the Recovered clock signal from the LIU IC) and the Transmit SONET POH Processor block (which is derived from the Clock Synthesizer block). Minor timing differences are easily handled by pointer adjustments.* *2. This condition will only occur if there is a major timing mismatch between the two clock signals. This condition can be viewed as an indicator of a fault condition within the source(s) of one of these clock signals.*
2	Receive DS3/E3 Underrun Indicator	R/O	**Receive DS3/E3 Underrun Indicator:** This READ-ONLY bit-field indicates whether or not the Channel is declaring a "Receive DS3/E3 Underrun" Condition. A "Receive DS3/E3 Underrun" condition will only occur if data is arriving into the DS3/E3 Framer block (in the Ingress Direction) at a much slower rate, than that being removed, by the Transmit SONET POH Processor block. 0 – Indicates that the Channel is NOT declaring the "Receive DS3/E3 Underrun" condition. 1 – Indicates that the Channel is currently declaring the "Receive DS3/E3 Underrun" condition. ***Note:*** *1. There will invariably be a timing mismatch between the clock signal driving the Ingress Direction of the DS3/E3 Framer block (e.g., the Recovered clock signal from the LIU IC) and the Transmit SONET POH Processor block (which is derived from the Clock Synthesizer block). Minor timing differences are easily handled by pointer adjustments.* *2. This condition will only occur if there is a major timing mismatch between the two clock signals. This condition can be viewed as an indicator of a fault condition within the source(s) of one of these clock signals.*
1	Transmit DS3/E3 Overrun Indicator	R/O	**Transmit DS3/E3 Overrun Indicator:** This READ-ONLY bit-field indicates whether or not the Channel is declaring a "Transmit DS3/E3 Overrun" Condition. A "Transmit DS3/E3 Overrun" condition will only occur if data is arriving into the Receive SONET POH Processor blocks at a much faster rate, than that being removed, by the DS3/E3 Framer block. 0 – Indicates that the Channel is NOT declaring the "Transmit DS3/E3 Overrun" condition. 1 – Indicates that the Channel is currently declaring the "Transmit DS3/E3 Overrun" condition. ***Note:*** *1. In most applications of the XRT94L33 there will typically not be a timing mismatch between the clock signal driving the DS3/E3 Framer block (in the Egress Direction) and the Receive SONET POH Processor block (each of these blocks are typically driving by a clock signal which is derived from the Receive STS-3 Clock signal).* *However, timing differences can exist if the Channel is configured to operate in*

			the Loop-Timing Mode. *2. Minor timing differences are easily handled by pointer adjustments.* *3. This condition will only occur if there is a major timing mismatch between the two clock signals. This condition can be viewed as an indicator of a fault condition within the source(s) of one of these clock signals.*
0	Transmit DS3/E3 Underrun Indicator	R/O	**Transmit DS3/E3 Underrun Indicator:** This READ-ONLY bit-field indicates whether or not the Channel is declaring a "Transmit DS3/E3 Underrun" Condition. A "Transmit DS3/E3 Underrun" condition will only occur if data is arriving into the Receive SONET POH Processor blocks at a much slower rate, than that being removed, by the DS3/E3 Framer block. 0 – Indicates that the Channel is NOT declaring the "Transmit DS3/E3 Underrun" condition. 1 – Indicates that the Channel is currently declaring the "Transmit DS3/E3 Underrun" condition. ***Note:*** *1. In most applications of the XRT94L33 there will typically not be a timing mismatch between the clock signal driving the DS3/E3 Framer block (in the Egress Direction) and the Receive SONET POH Processor block (each of these blocks are typically driving by a clock signal which is derived from the Receive STS-3 Clock signal).* *However, timing differences can exist if the Channel is configured to operate in the Loop-Timing Mode.* *2. 1 - 0	JA Source[1:0]	R/W	**Jitter Attenuator Configuration/Orientation:** This READ/WRITE bit-field permits the user to configure the Jitter Attenuator to operate in either in the Ingress Direction, the Egress Direction or be by-passed altogether, as depicted below. **JA Source[1:0]** / **Resuting Jitter Attenuator Configuration** 00 – By-Passed 01 – Jitter Attenuator is in Egress Direction 10 – Jitter Attenuator is in Ingress Direction 11 – Do NOT use **NOTE:** For most applications, we recommend that the user set these two bits to the value of "[0, 1]".

1.13 RECEIVE STS-1 TOH AND POH PROCESSOR BLOCK

The register map for the Receive STS-1 TOH and POH Processor Block is presented in the Table below. Additionally, a detailed description of each of the "Receive STS-1 TOH and POH Processor" block registers is presented below.

In order to provide some orientation for the reader, an illustration of the Functional Block Diagram for the XRT94L33, with the "Receive STS-1 TOH and POH Processor Blocks "highlighted" is presented below in Figure 10

Figure 10: Illustration of the Functional Block Diagram of the XRT94L33 (whenever it has been configured to operate in the 3-Channel DS3/STS-1 to STS-3 Mode), with the Receive STS-1 TOH and POH Processor Blocks "High-lighted".

1.13.1 RECEIVE STS-1 TOH AND POH PROCESSOR BLOCK REGISTER DESCRIPTION

Table 452: Receive STS-1 Transport Control Register – Byte 0 (Address Location = 0xN103, where N ranges in value from 0x05 to 0x07)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused	SF Defect Condition Detect Enable	SD Defect Condition Detect Enable	Descramble Disable	Unused	REI-L Error Type	B2 Error Type	B1 Error Type
R/O	R/W	R/W	R/W	R/O	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Unused	R/O	
6	SF Defect Condition Detect Enable	R/W	**Signal Failure (SF) Defect Condition Detect Enable:** This READ/WRITE bit-field permits the user to enable or disable SF Defect Detection and Declaration by the Receive STS-1 TOH Processor block. 0 – Configures the Receive STS-1 TOH Processor block to NOT declare nor clear the SF defect condition per the "user-specified SF defect declaration and clearance" criteria. 1 – Configures the Receive STS-1 TOH Processor block to declare and clear the SF defect condition per the "user-specified SF defect declaration and clearance" criteria.
5	SD Defect Condition Detect Enable	R/W	**Signal Degrade (SD) Defect Condition Detect Enable:** This READ/WRITE bit-field permits the user to enable or disable SD Detection and Declaration by the Receive STS-1 TOH Processor block. 0 – Configures the Receive STS-1 TOH Processor block to NOT declare nor clear the SD defect condition per the "user-specified SD defect declaration and clearance" criteria. 1 – Configures the Receive STS-1 TOH Processor block to declare and clear the SD defect condition per the "user-specified SD defect declaration and clearance" criteria.
4	Descramble Disable	R/W	**De-Scramble Disable:** This READ/WRITE bit-field permits the user to either enable or disable de-scrambling by the Receive STS-1 TOH Processor block, associated with channel N. 0 – De-Scrambling is enabled. 1 – De-Scrambling is disabled.
3	Unused	R/O	
2	REI-L Error Type	R/W	**REI-L Error Type:** This READ/WRITE bit-field permits the user to specify how the Receive STS-1 TOH Processor block will count (or tally) REI-L events, for Performance Monitoring purposes. The user can configure the Receive STS-1 TOH Processor block to increment REI-L events on either a "per-bit" or "per-frame" basis. If the user configures the Receive STS-1 TOH Processor block to increment REI-L events on a "per-bit" basis, then it will incrememt the "Receive STS-1 Transport REI-L Error Count" register by the value of the lower nibble within the M0/M1 byte of the incoming STS-1 data-stream.

			If the user configures the Receive STS-1 TOH Processor block to increment REI-L events on a "per-frame" basis, then it will increment the "Receive STS-1 Transport REI-L Error Count" register each time it receives an STS-1 frame, in which the lower nibble of the M0/M1 byte is set to a "non-zero" value. 0 – Configures the Receive STS-1 TOH Processor block to count or tally REI-L events on a per-bit basis. 1 – Configures the Receive STS-1 TOH Processor block to count or tally REI-L events on a per-frame basis.
1	B2 Error Type	R/W	**B2 Error Type:** This READ/WRITE bit-field permits the user to specify how the "Receive STS-1 TOH Processor block will count (or tally) B2 byte errors, for Performance Monitoring purposes. The user can configure the Receive STS-1 TOH Processor block to increment B2 byte errors on either a "per-bit" or a "per-frame" basis. If the user configures the Receive STS-1 TOH Processor block to increment B2 byte errors on a "per-bit" basis, then it will increment the "Receive Transport B2 Byte Error Count" register by the number of bits (within the B2 byte value) that is in error. If the user configures the Receive STS-1 TOH Processor block to increment B2 byte errors on a "per-frame" basis, then it will increment the "Receive Transport B2 Byte Error Count" register each time it receives an STS-1 frame that contains an erred B2 byte. 0 – Configures the Receive STS-1 TOH Processor block to count B2 byte errors on a "per-bit" basis. 1 – Configures the Receive STS-1 TOH Processor block to count B2 byte errors on a "per-frame" basis.
0	B1 Error Type	R/W	**B1 Error Type:** This READ/WRITE bit-field permits the user to specify how the Receive STS-1 TOH Processor block will count (or tally) B1 byte errors, for Performance Monitoring purposes. The user can configure the Receive STS-1 TOH Processor block to increment B1 byte errors on either a "per-bit" or "per-frame" basis. If the user configures the Receive STS-1 TOH Processor block to increment B1 byte errors on a "per-bit" basis, then it will increment the "Receive Transport B1 Byte Error Count" register by the number of bits (within the B1 byte value) that is in error. If the user configures the Receive STS-1 TOH Processor block to increment B1 byte errors on a "per-frame" basis, then it will increment the "Receive Transport B1 Byte Error Count" Register each time it receives an STS-1 frame that contains an erred B1 byte. 0 – Configures the Receive STS-1 TOH Processor block to count B1 byte errors on a "per-bit" basis. 1 – Configures the Receive STS-1 TOH Processor block to count B1 byte errors on a "per-frame" basis.

Table 453: Receive STS-1 Transport Status Register – Byte 1 (Address Location= 0xN106, where N ranges in value from 0x05 to 0x07)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0

0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 3	Unused	R/O	
2	Section Trace Message Mismatch Defect Declared	R/O	**Section Trace Message Mismatch Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-1 TOH Processor block is currently declaring the Section Trace Mismatch defect condition. The Receive STS-1 TOH Processor block will declare the Section Trace Message Mismatch defect condition, whenever it accepts a Section Trace Message (via the J0 byte, within the incoming STS-1 data-stream) that differs from the "Expected Section Trace Message". 0 – Indicates that the Section Trace Message Mismatch Defect Condition is NOT currently being declared. 1 – Indicates that the Section Trace Message Mismatch Defect Condition is currently being declared.
1	Section Trace Message Unstable Defect Declared	R/O	**Section Trace Message Unstable Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-1 TOH Processor block is currently declaring the Section Trace Message Unstable Defect condition. The Receive STS-1 TOH Processor block will declare the Section Trace Message Unstable defect condition, whenever the "Section Trace Message Unstable" counter reaches the value 8. The "Section Trace Message Unstable" counter will be incremented for each time that it receives a Section Trace message that differs from the "Expected Section Trace Message". The "Section Trace Message Unstable" counter is cleared to "0" whenever the Receive STS-3 TOH Processor block has received a given Section Trace Message 3 (or 5) consecutive times. ***Note:*** *Receiving a given Section Trace Message 3 (or 5) consecutive times also sets this bit-field to "0".* 0 – Section Trace Message Unstable defect condition is NOT currently being declared. 1 – Section Trace Message Unstable defect condition is currently being declared.
0	AIS-L Defect Detected	R/O	**AIS-L Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-1 TOH Processor block is currently declaring the AIS-L (Line AIS) defect condition. The Receive STS-1 TOH Processor block will declare the AIS-L defect condition within the incoming STS-1 data stream if bits 6, 7 and 8 (e.g., the Least Significant Bits, within the K2 byte) are set to the value "[1, 1, 1]" for five consecutive STS-1 frames. 0 – Indicates that the AIS-L defect condition is NOT currently being declared.

			1 – Indicates that the AIS-L defect condition is currently being declared.

Table 454: Receive STS-1 Transport Status Register – Byte 0 (Address Location = 0xN107, where N ranges in value from 0x05 to 0x07)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
RDI-L Defect Declared	S1 Byte Unstable Defect Declared	K1, K2 Byte Unstable Defect Declared	SF Defect Declared	SD Defect Declared	LOF Defect Detected	SEF Defect Declared	LOS Defect Declared
R/O	R/O	R/O	R/O	R/O	R/O	R/O	R/O
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	RDI-L Defect Declared	R/O	**RDI-L Defect Declared Indicator:** This READ-ONLY bit-field indicates whether or not the Receive STS-1 TOH Processor block is detecting the RDI-L (Line-Remote Defect Indicator) defect condition, within the incoming STS-1 signal. The Receive STS-1 TOH Processor block will declare the RDI-L defect condition whenever bits 6, 7 and 8 (e.g., the three least significant bits) of the K2 byte contains the "1, 1, 0" pattern in 5 consecutive incoming STS-1 frames. 0 – Indicates that the RDI-L defect condition is NOT currently being declared. 1 – Indicates that the RDI-L defect condition is currently being declared.
6	S1 Byte Unstable Defect Declared	R/O	**S1 Byte Unstable Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-1 TOH Processor block is currently declaring the "S1 Byte Unstable" defect condition. The Receive STS-1 TOH Processor block will declare the "S1 Byte Unstable" defect condition whenever the "S1 Byte Unstable Counter" reaches the value 32. The "S1 Byte Unstable Counter" is incremented for each time that the Receive STS-1 TOH Processor block receives an STS-1 frame that contains an S1 byte that differs from the previously received S1 byte. The "S1 Byte Unstable Counter" is cleared to "0" when the same S1 byte is received for 8 consecutive STS-1 frames. ***Note:*** *Receiving a given S1 byte, in 8 consecutive STS-1 frames also sets this bit-field to "0".* 0 – Indicates that the S1 Byte Unstable Defect Condition is NOT currently being declared. 1 – Indicates that the S1 Byte Unstable Defect Condition is currently being declared.
5	K1, K2 Byte Unstable Defect Declared	R/O	**K1, K2 Byte Unstable Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-1 TOH Processor block is currently declaring the "K1, K2 Byte Unstable" defect condition. The Receive STS-1 TOH Processor block will declare the "K1, K2 Byte Unstable" defect condition whenever the Receive STS-1 TOH Processor block fails to receive the same set of K1, K2 bytes, in 12 consecutive incoming STS-1 frames. The "K1, K2 Byte Unstable" defect condition is cleared whenever the Receive STS-1 TOH Processor block has received a given set of K1, K2 byte values within three consecutive incoming STS-1 frames. 0 – Indicates that the K1, K2 Byte Unstable Defect Condition is NOT currently being declared. 1 – Indicates that the K1, K2 Byte Unstabel Defect Condition is currently being declared.

4	SF Defect Declared	R/O	**SF (Signal Failure) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-1 TOH Processor block is currently declaring the SF defect condition. The Receive STS-1 TOH Processor block will declare the SF defect condition anytime it has determined that the number of B2 byte errors (measured over a user-selected period of time) exceeds a certain "user-specified B2 Byte Error" threshold. 0 – Indicates that the SF Defect condition is NOT currently being declared. This bit is set to "0" when the number of B2 byte errors (accumulated over a given interval of time) does not exceed the "SF Defect Declaration" threshold. 1 – Indicates that the SF Defect condition is currently being declared. This bit is set to "1" when the number of B2 errors (accumulated over a given interval of time) does exceed the "SF Defect Declaration" threshold.
3	SD Defect Declared	R/O	**SD (Signal Degrade) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-1 TOH Processor block is currently declaring the SD defect condition. The Receive STS-1 TOH Processor block will declare the SD defect condition anytime it has determined that the number of B2 byte errors (measured over a user-selected period of time) exceeds a certain "user-specified B2 Byte Error" threshold. 0 – Indicates that the SD Defect condition is NOT currently being declared. This bit is set to "0" when the number of B2 errors (accumulated over a given interval of time) does not exceed the "SD Declaration" threshold. 1 – Indicates that the SD Defect condition is currently being declared. This bit is set to "1" when the number of B2 errors (accumulated over a given interval of time) does exceed the "SD Defect Declaration" threshold.
2	LOF Defect Declared	R/O	**LOF (Loss of Frame) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-1 TOH Processor block is currently declaring the LOF defect condition. The Receive STS-1 TOH Processor block will declare the LOF defect condition if it has been declaring the SEF condition for 24 consecutive STS-1 frame periods. Once the LOF defect is declared, then the Receive STS-1 TOH Processor block will clear the LOF defect if it has not been declaring the SEF condition for 3ms (or 24 consecutive STS-1 frame periods). 0 – Indicates that the Receive STS-1 TOH Processor block is NOT currently declaring the LOF defect condition. 1 – Indicates that the Receive STS-1 TOH Processor block is currently declaring the LOF defect condition.
1	SEF Defect Declared	R/O	**SEF (Severely Errored Frame) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-1 TOH Processor block is currently declaring the SEF defect condition. The Receive STS-1 TOH Processor block will declare the SEF defect condition if it detects Framing Alignment byte errors in four consecutive STS-1 frames. Once the Receive TOH Processor block declares the SEF defect condition, the Receive STS-1 TOH Processor block will then clear the SEF defect condition if it detects two consecutive STS-1 frames with un-erred framing alignment bytes. If the Receive TOH Processor block declares the SEF defect condition for 24 consecutive STS-1 frame periods, then it will declare the LOF defect condition. 0 – Indicates that the Receive STS-1 TOH Processor block is NOT currently declaring the SEF defect condition. 1 – Indicates that the Receive STS-1 TOH Processor block is currently declaring the SEF defect condition.

0	LOS Defect Declared	R/O	**LOS (Loss of Signal) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-1 TOH Processor block is currently declaring the LOS (Loss of Signal) defect condition. The Receive STS-1 TOH Processor block will declare the LOS defect condition if it detects "LOS_THRESHOLD[15:0]" consecutive "All Zero" bytes in the incoming STS-1 data stream. ***Note:*** *The user can set the "LOS_THRESHOLD[15:0]" value by writing the appropriate data into the "Receive STS-1 Transport – LOS Threshold Value" Register (Address Location= 0xN12E and 0xN12F, where N ranges in value from 0x05 to 0x07).* 0 – Indicates that the Receive STS-1 TOH Processor block is NOT currently declaring the LOS defect condition. 1 – Indicates that the Receive STS-1 TOH Processor block is currently declaring the LOS defect condition.

Table 455: Receive STS-1 Transport Interrupt Status Register – Byte 2 (Address Location= 0xN109, where N ranges in value from 0x05 to 0x07)

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	New S1 Byte Value Interrupt Status	RUR	**New S1 Byte Value Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "New S1 Byte Value" Interrupt has occurred since the last read of this register. The Receive STS-1 TOH Processor block will generate the "New S1 Byte Value" Interrupt, anytime it has "accepted" a new S1 byte, from the incoming STS-1 data-stream. 0 – Indicates that the "New S1 Byte Value" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "New S1 Byte Value" interrupt has occurred since the last read of this register. ***Note:*** *The user can obtain the value for this most recently accepted value of the S1 byte by reading the "Receive STS-1 Transport S1 Byte Value" register (Address Location= 0xN127).*
6	Change in S1 Byte Unstable Defect Condition Interrupt Status	RUR	**Change in S1 Byte Unstable Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in S1 Byte Unstable Defect Condition" Interrupt has occurred since the last read of this register. The Receive STS-1 TOH Processor block will generate this interrupt in response to either of the following events. • Whenever the Receive STS-1 TOH Processor block declares the "S1 Byte Unstable" defect condition. • Whenever the Receive STS-1 TOH Processor block clears the "S1 Byte Unstable" defect condition. 0 – Indicates that the "Change in S1 Byte Unstable Defect Condition" Interrupt has occurred since the last read of this register. 1 – Indicates that the "Change in S1 Byte Unstable Defect Condition" Interrupt has not occurred since the last read of this register. ***Note:*** *The user can obtain the current "S1 Byte Unstable Defect" condition by reading the contents of Bit 6 (S1 Byte Unstable Defect Declared) within the "Receive STS-1 Transport Status Register – Byte 0" (Address*

			Location= 0xN107, where N ranges in value from 0x05 to 0x07).
5	Change in Section Trace Message Unstable Defect Condition Interrupt Status	RUR	**Change in Section Trace Message Unstable Defect condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in Section Trace Message Unstable" defect condition interrupt has occurred since the last read of this register. The Receive STS-1 TOH Processor block will generate this interrupt in response to either of the following events. • Whenever the Receive STS-1 TOH Processor block declares the "Section Trace Message Unstable defect" condition. • Whenever the Receive STS-1 TOH Processor block clear the "Section Trace Message Unstable defect" condition. 0 – Indicates that the "Change in Section Trace Message Unstable defect" condition interrupt has not occurred since the last read of this register. 1 – Indicates that the "Change in Section Trace Message Unstable defect" condition interrupt has occurred since the last read of this register.
4	New Section Trace Message Interrupt Status	RUR	**New Section Trace Message Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "New Section Trace Message" interrupt has occurred since the last read of this register. The Receive STS-1 TOH Processor block will generate this interrupt anytime it has accepted a new "Section Trace" Message within the incoming STS-1 data-stream. 0 – Indicates that the "New Section Trace Message Interrupt" has not occurred since the last read of this register. 1 – Indicates that the "New Section Trace Message Interrupt" has occurred since the last read of this register. ***Note:*** *The user can read out the contents of the "Receive Section Trace Message Buffer", which is located at Address Locations 0xN300 through 0xN33F (where N ranges in value from 0x05 to 0x07).*
3	Change in Section Trace Mismatch Defect Condition Interrupt Status	RUR	**Change in Section Trace Message Mismatch Defect Condition" Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in Section Trace Mismatch Defect Condition" interrupt has occurred since the last read of this register. The Receive STS-1 TOH Processor block will generate this interrupt in response to either of the following events. • Whenever the Receive STS-1 TOH Processor block declares the "Section Trace Message Mismatch" defect condition • Whenever the Receive STS-1 TOH Processor block clears the "Section Trace Mismatch" defect condition. 0 – Indicates that the "Change in Section Trace Message Mismatch Defect Condition" interrupt has not occurred since the last read of this register. 1 – Indicates that the "Change in Section Trace Message Mismatch Defect Condition" interrupt has occurred since the last read of this register. ***Note:*** *The user can determine whether the "Section Trace*

			Message Mismatch" condition is currently "cleared" or "declared" by reading the state of Bit 2 (Section Trace Message Mismatch Defect Declared) within the "Receive STS-1 Transport Status Register – Byte 1 (Address Location= 0xN106).
2	Unused	R/O	
1	Change in K1, K2 Byte Unstable Defect Condition Interrupt Status	RUR	**Change in K1, K2 Byte Unstable Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in K1, K2 Byte Unstable Defect Condition" interrupt has occurred since the last read of this register. The Receive STS-1 TOH Processor block will generate this interrupt in response to either of the following events. • Whenever the Receive STS-1 TOH Processor block declares the "K1, K2 Byte Unstable Defect" condition. • Whenever the Receive STS-1 TOH Processor block clears the "K1, K2 Byte Unstable Defect" condition. 0 – Indicates that the "Change of K1, K2 Byte Unstable Defect Condition" interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change of K1, K2 Byte Unstable Defect Condition" interrupt has occurred since the last read of this register. ***Note:*** *The user can determine whether the "K1, K2 Byte Unstable Defect Condition" is currently being declared or cleared by reading out the contents of Bit 5 (K1, K2 Byte Unstable Defect Declared), within the "Receive STS-1 Transport Status Register – Byte 0" (Address Location= 0xN107).*
0	New K1, K2 Byte Value Interrupt Status	RUR	**New K1, K2 Byte Value Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "New K1, K2 Byte Value" Interrupt has occurred since the last read of this register. The Receive STS-1 TOH Processor block will generate this interrupt whenever its has "accepted" a new set of K1, K2 byte values from the incoming STS-1 data-stream. 0 – Indicates that the "New K1, K2 Byte Value" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "New K1, K2 Byte Value" Interrupt has occurred since the last read of this register. ***Note:*** *The user can obtain the contents of the new K1 byte by reading out the contents of the "Receive STS-1 Transport K1 Byte Value" Register (Address Location= 0xN11F). Further, the user can also obtain the contents of the new K2 byte by reading out the contents of the "Receive STS-1 Transport K2 Byte Value" Register (Address Location= 0xN123).*

7	Change of SF Defect Condition Interrupt Status	RUR	**Change of Signal Failure (SF) Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change of SF Defect Condition Interrupt" has occurred since the last read of this register. The Receive STS-1 TOH Processor block will generate this interrupt in response to either of the following events. • Whenever the Receive STS-1 TOH Processor block declares the SF Defect Condition. • Whenever the Receive STS-1 TOH Processor block clears the SF Defect Condition. 0 - Indicates that the "Change of SF Defect Condition Interrupt" has NOT occurred since the last read of this register. 1 – Indicates that the "Change of SF Defect Condition Interrupt" has occurred since the last read of this register. ***Note:*** *The user can determine whether or not the SF defect condition is currently being declared by reading out the state of Bit 4(SF Defect Declared) within the "Receive STS-1 Transport Status Register – Byte 0 (Address Location= 0xN107).*
6	Change of SD Defect Condition Interrupt Status	RUR	**Change of Signal Degrade (SD) Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change of SD Defect Condition Interrupt" has occurred since the last read of this register. The Receive STS-1 TOH Processor block will generate this interrupt in response to either of the following events. • Whenver the Receive STS-1 TOH Processor block declares the SD Defect Condition. • Whenever the Receive STS-1 TOH Processor block clears the SD Defect Condition. 0 – Indicates that the "Change of SD Defect Condition Interrupt" has NOT occurred since the last read of this register. 1 – Indicates that the "Change of SD Defect Condition Interrupt" has occurred since the last read of this register. ***Note:*** *The user can determine whether or not the SD Defect condition is currently being declareds by reading out the state of Bit 3 (SD Defect Declared) within the "Receive STS-1 Transport Status Register – Byte 0 (Address Location= 0xN107).*
5	Detection of REI-L Event Interrupt Status	RUR	**Detection of REI-L (Line – Remote Error Indicator) Event Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of

			REI-L Event" Interrupt has occurred since the last read of this register. The Receive STS-1 TOH Processor block will generate this interrupt anytime it detects an REI-L event within the incoming STS-1 data-stream. 0 - Indicates that the "Detection of REI-L Event" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of REI-L Event" Interrupt has occurred since the last read of this register.
4	Detection of B2 Byte Error Interrupt Status	RUR	**Detection of B2 Byte Error Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of B2 Byte Error Interrupt" has occurred since the last read of this register. The Receive STS-1 TOH Processor block will generate this interrupt anytime it detects a B2 byte error within the incoming STS-1 data-stream. 0 – Indicates that the "Detection of B2 Byte Error Interrupt" has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of B2 Byte Error Interrupt" has occurred since the last read of this register.
3	Detection of B1 Byte Error Interrupt Status	RUR	**Detection of B1 Byte Error Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of B1 Byte Error Interrupt" has occurred since the last read of this register. The Receive STS-1 TOH Processor block will generate this interrupt anytime it detects a B1 byte error within the incoming STS-1 data-stream. 0 - Indicates that the "Detection of B1 Byte Error Interrupt" has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of B1 Byte Error Interrupt" has occurred since the last read of this register
2	Change of LOF Defect Condition Interrupt Status	RUR	**Change of Loss of Frame (LOF) Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change of LOF Defect Condition" interrupt has occurred since the last read of this register. The Receive STS-1 TOH Processor block will generate this interrupt in response to either of the following events. • Whenever the Receive STS-1 TOH Processor block declares the LOF Defect condition. • Whenever the Receive STS-1 TOH Processor block clears the LOF Defect condition. 0 – Indicates that the "Change of LOF Defect Condition" interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change of LOF Defect Condition" interrupt has occurred since the last read of this register. ***Note:*** *The user can determine whether or not the Receive STS-1 TOH Processor block is currently declaring the LOF defect condition by reading out the state of Bit 2 (LOF Defect Declared) within the "Receive STS-1 Transport Status Register – Byte 0 (Address Location= 0xN107).*
1	Change of SEF Defect Condition Interrupt Status	RUR	**Change of SEF Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change of SEF Defect Condition" Interrupt has occurred since the last read of this register. The Receive STS-1 TOH Processor block will generate this interrupt in response to either of the following events. • Whenever the Receive STS-1 TOH Processor block declares the SEF defect condition.

			• Whenever the Receive STS-1 TOH Processor block clears the SEF defect condition. 0 – Indicates that the "Change of SEF Defect Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change of SEF Defect Condition" Interrupt has occurred since the last read of this register. ***Note:*** *The user can determine whether or not the Receive STS-1 TOH Processor block is currently declaring the SEF defect condition by reading out the state of Bit 1 (SEF Defect Declared) within the "Receive STS-1 Transport Status Register – Byte 0 (Address Location= 0xN107).*
0	Change of LOS Defect Condition Interrupt Status	RUR	**Change of Loss of Signal (LOS) Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change of LOS Defect Condition" interrupt has occurred since the last read of this register. The Receive STS-1 TOH Processor block will generate this interrupt in response to either of the following events. • Whenever the Receive STS-1 TOH Processor block declares the LOS defect condition. • Whenever the Receive STS-1 TOH Processor block clears the LOS defect condition. 0 – Indicates that the "Change of LOS Defect Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change of LOS Defect Condition" Interrupt has occurred since the last read of this register. ***Note:*** *The user can determine whether or not the Receive STS-1 TOH Processor block is currently declaring the LOS defect condition by reading out the contents of Bit 0 (LOS Defect Declared) within the Receive STS-1 Transport Status Register – Byte 0 (Address Location= 0xN107).*

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	New S1 Byte Value Interrupt Enable	R/W	**New S1 Byte Value Interrupt Enable:** This READ/WRITE bit-field permits the user to enable or disable the "New S1 Byte Value" Interrupt. If the user enables this interrupt, then the Receive STS-1 TOH Processor block will generate this interrupt anytime it receives and accepts a new S1 byte value. The Receive STS-1 TOH Processor block will accept a new S1 byte after it has received it for 8 consecutive STS-1 frames. 0 – Disables the "New S1 Byte Value" Interrupt. 1 – Enables the "New S1 Byte Value" Interrupt.
6	Change in S1 Byte Unstable Defect Condition Interrupt Enable	R/W	**Change in S1 Byte Unstable Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in S1 Byte Unstable Defect Condition" Interrupt. If the user enables this bit-field, then the Receive STS-1 TOH Processor block will generate an interrupt in response to either of the following conditions. • When the Receive STS-1 TOH Processor block declares the "S1 Byte Unstable" defect condition. • When the Receive STS-1 TOH Processor block clears the "S1 Byte Unstable" defect condition. 0 – Disables the "Change in S1 Byte Unstable Defect Condition" Interrupt. 1 – Enables the "Change in S1 Byte Unstable Defect Condition" Interrupt.
5	Change in Section Trace Message Unstable Defect Condition Interrupt Enable	R/W	**Change in Section Trace Message Unstable defect condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in Section Trace Message Unstable Defect Condition" Interrupt. If the user enables this interrupt, then the Receive STS-1 TOH Processor block will generate an interrupt in response to either of the following conditions. • Whenever the Receive STS-1 TOH Processor block declares the "Section Trace Message Unstable" defect condition. • Whenever the Receive STS-1 TOH Processor block clears the "Section Trace Message Unstable" defect condition. 0 – Disable the "Change of Section Trace Message Unstable defect condition" Interrupt.

			1 – Enables the "Change of Section Trace Message Unstable defect condition" Interrupt.
4	New Section Trace Message Interrupt Enable	R/W	**New Section Trace Message Interrupt Enable:** This READ/WRITE bit-field permits the user to enable or disable the "New Section Trace Message" interrupt. If the user enables this interrupt, then the Receive STS-1 TOH Processor block will generate this interrupt anytime it receives and accepts a new Section Trace Message within the incoming STS-1 data-stream. The Receive STS-1 TOH Processor block will accept a new Section Trace Message after it has received it 3 (or 5) consecutive times. 0 – Disables the "New Section Trace Message" Interrupt. 1 – Enables the "New Section Trace Message" Interrupt.
3	Change in Section Trace Message Mismatch Defect Condition Interrupt Enable	R/W	**Change in "Section Trace Mismatch Defect Condition" interrupt enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in Section Trace Mismatch defect condition" interrupt. If the user enables this interrupt, then the Receive STS-1 TOH Processor block will generate an interrupt in response to either of the following events. a. Whenever the Receive STS-1 TOH Processor block declares the "Section Trace Message Mismatch Defect" condition. b. Whenever the Receive STS-1 TOH Processor block clears the "Section Trace Message Mismatch defect" condition. ***Note:*** *The user can determine whether or not the Receive STS-1 TOH Processor block is currently declaring the "Section Trace Message Mismatch defect" condition by reading the state of Bit 2 (Section Trace Message Mismatch Defect Condition Declared) within the "Receive STS-1 Transport Status Register – Byte 1 (Address Location= 0xN106).*
2	Unused	R/O	
1	Change in K1, K2 Byte Unstable Defect Condition Interrupt Enable	R/W	**Change of K1, K2 Byte Unstable Defect Condition - Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change of K1, K2 Byte Unstable defect condition" interrupt. If the user enables this interrupt, then the Receive STS-1 TOH Processor block will generate an Interrupt in response to either of the following events. a. Whenever the Receive STS-1 TOH Processor block declares the "K1, K2 Byte Unstable defect" condition. b. Whenever the Receive STS-1 TOH Processor block clears the "K1, K2 Byte Unstable defect" condition. 0 – Disables the "Change of K1, K2 Byte Unstable Defect Condition" Interrupt. 1 – Enables the "Change of K1, K2 Byte Unstable Defect Condition" Interrupt.
0	New K1K2 Byte Interrupt Enable	R/W	**New K1, K2 Byte Value Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "New K1, K2 Byte Value" Interrupt. If the user enables this interrupt, then the Receive STS-1 TOH Processor block will generate this interrupt anytime it receives and accepts a new K1, K2 byte value. The Receive STS-1 TOH Processor block will accept a new K1, K2 byte value, after it has received it within 3 (or 5) consecutive STS-1 frames. 0 – Disables the "New K1, K2 Byte Value" Interrupt.

			1 – Enables the “New K1, K2 Byte Value” Interrupt.

7-0	SD_SET_MONITOR_WINDOW [7:0]	R/W	**SD_SET_MONITOR_INTERVAL – LSB:** These READ/WRITE bits, along the contents of the "Receive STS-1 Transport – SD SET Monitor Interval – Byte 2 and Byte 1" registers permit the user to specify the length of the "monitoring period" (in terms of ms) for SD (Signal Degrade) defect declaration. When the Receive STS-1 TOH Processor block is checking the incoming STS-1 signal in order to determine if it should declare the SD defect condition, it will accumulate B2 byte errors throughout the user-specified "SD Defect Declaration Monitoring Period". If, during this "SD Defect Declaration Monitoring Period", the Receive STS-1 TOH Processor block accumulates more B2 byte errors than that specified within the "Receive STS-1 Transport SD SET Threshold" register, then the Receive STS-1 TOH Processor block will declare the SD defect condition. **NOTES:** 1. The value that the user writes into these three (3) "SD Set Monitor Window" registers, specifies the duration of the "SD Defect Declaration" Monitoring Period, in terms of ms. 2. This particular register byte contains the "LSB" (least significant byte) value of the three registers that specify the "SD Defect Declaration Monitoring period".

0	SEF FORCE	R/W	**SEF Defect Condition Force:** This READ/WRITE bit-field permits the user to force the Receive STS-1 TOH Processor block (within the corresponding Channel) to declare the SEF defect condition. The Receive STS-1 TOH Processor block will then attempt to reacquire framing. Writing a "1" into this bit-field configures the Receive STS-1 TOH Processor block to declare the SEF defect. The Receive STS-1 TOH Processor block will automatically set this bit-field to "0" once it has reacquired framing (e.g., has detected two consecutive STS-1 frames with the correct A1 and A2 bytes).

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 5	Unused	R/O	
4	Receive Section Trace Message Buffer Read Select	R/W	**Receive Section Trace Message Buffer Read Selection:** This READ/WRITE bit-field permits a user to specify which of the following Receive Section Trace Message buffer segments that the Microprocessor will read out, whenever it reads out the contents of the Receive Section Trace Message Buffer. a. The "Actual" Receive Section Trace Message Buffer. The "Actual" Receive Section Trace Message Buffer contains the contents of the most recently received (and accepted) Section Trace Message via the incoming STS-1 data-stream. b. The "Expected" Receive Section Trace Message Buffer. The "Expected" Receive Section Trace Message Buffer contains the contents of the Section Trace Message that the user "expects" to receive. The contents of this particular buffer is usually specified by the user. 0 – Executing a READ to the Receive Section Trace Message Buffer address space, will return contents within the "Actual" Receive Section Trace Message" buffer. 1 – Executing a READ to the Receive Section Trace Message Buffer address space will return contents within the "Expected" Receive Section Trace Message Buffer". ***Note:*** *In the case of the Receive STS-3 TOH Processor block, the "Receive Section Trace Message Buffer" is located at Address Location 0xN300 through 0xN33F (where N ranges in value from 0x05 through 0x07).*
3	Receive Section Trace Message Accept Threshold	R/W	**Receive Section Trace Message Accept Threshold:** This READ/WRITE bit-field permits a user to select the number of consecutive times that the Receive STS-1 TOH Processor block must receive a given Section Trace Message, before it is accepted, as described below. Once a given "Section Trace Message" has been accepted then it can be read out of the "Actual Receive Section Trace Message" Buffer. 0 – Configures the Receive STS-1 TOH Processor block to accept the incoming Section Trace Message after it has received it the third time in succession. 1 – Configures the Receive STS-1 TOH Processor block to accept the incoming Section Trace Message after it has received in the fifth time in succession.

<table>
<tr><td>2</td><td>Section Trace Message Alignment Type</td><td>R/W</td><td>Section Trace Message Alignment Type:

This READ/WRITE bit-field permits a user to specify how the Receive STS-1 TOH Processor block will locate the boundary of the incoming Section Trace Message within the incoming STS-1 data-stream, as indicated below.

0 – Configures the Receive STS-1 TOH Processor block to expect the Section Trace Message boundary to be denoted by a “Line Feed” character.

1 – Configures the Receive STS-1 TOH Processor block to expect the Section Trace Message boundary to be denoted by the presence of a “1” in the MSB (most significant bit) of the very first byte (within the incoming Section Trace Message). In this case, all of the remaining bytes (within the incoming Section Trace Message) will each have a “0” within their MSBs.</td></tr>
<tr><td>1 - 0</td><td>Receive Section Trace Message Length[1:0]</td><td>R/W</td><td>Receive Section Trace Message Length[1:0]:

These READ/WRITE bit-fields permit the user to specify the length of the Section Trace Message that the Receive STS-1 TOH Processor block will accept and load into the “Actual” Receive Section Trace Message Buffer. The relationship between the content of these bit-fields and the corresponding Receive Section Trace Message Length is presented below.

<table>

7	Transmit AIS-P (Down-stream) upon Section Trace Message Unstable	R/W	**Transmit Path AIS upon Declaration of the Section Trace Message Unstable Defect Condition:** This READ/WRITE bit-field permits the user to configure the Receive STS-1 TOH Processor block to automatically transmit the Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards the corresponding Receive STS-1 POH Processor block), anytime it declares the Section Trace Message Unstable defect condition within the "incoming" STS-1 data-stream. 0 – Does not configure the Receive STS-1 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic) whenever (and for the duration that) it declares the "Section Trace Message Unstable" defect condition. 1 – Configures the Receive STS-1 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic) whenever (and for the duration that) it declares the "Section Trace Message Unstable" defect condition. ***Note:*** *The user must also set Bit 0 (Transmit AIS-P Enable) to "1" to configure the Receive STS-1 TOH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.*
6	Transmit AIS-P (Down-stream) Upon Section Trace Message Mismatch	R/W	**Transmit Path AIS (AIS-P) upon Declaration of the Section Trace Message Mismatch Defect Condition:** This READ/WRITE bit-field permits the user to configure the Receive STS-1 TOH Processor block to automatically transmit the Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards the corresponding Receive STS-1 POH Processor blocks), anytime (and for the duration that) it declares the Section Trace Message Mismatch defect condition within the "incoming" STS-1 data stream. 0 – Does not configure the Receive STS-1 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic) whenever it declares the "Section Trace Mismatch" defect condition. 1 – Configures the Receive STS-1 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic) whenever (and for the duration that) it declares the "Section Trace Message Mismatch" defect condition. ***Note:*** *The user must also set Bit 0 (Transmit AIS-P Enable) to "1"*

			to configure the Receive STS-1 TOH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.
5	Transmit AIS-P (Down-stream) upon SF	R/W	**Transmit Path AIS upon declaration of the Signal Failure (SF) defect condition:** This READ/WRITE bit-field permits the user to configure the Receive STS-1 TOH Processor block to automatically transmit a Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards the corresponding Receive STS-1 POH Processor block), anytime (and for the duration that) it declares the SF defect condition. 0 – Does not configure the Receive STS-1 TOH Processor block to transmit the AIS-P indicator (via the "downstream" traffic) upon declaration of the SF defect. 1 – Configures the Receive STS-1 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic) anytime (and for the duration that) it declares the SF defect condition. ***Note:*** *The user must also set Bit 0 (Transmit AIS-P Enable) to "1" to configure the Receive STS-1 TOH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.*
4	Transmit AIS-P (Down-stream) upon SD	R/W	**Transmit Path AIS upon declaration of the Signal Degrade (SD) defect:** This READ/WRITE bit-field permits the user to configure the Receive STS-1 TOH Processor block to automatically transmit a Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards the corresponding Receive STS-1 POH Processor block) anytime (and for the duration that) it declares the SD defect condition. 0 – Does not configure the Receive STS-1 TOH Processor block to transmit the AIS-P indicator (via the "downstream" traffic) upon declaration of the SD defect. 1 – Configures the Receive STS-1 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic) anytime (and for the duration that) it declares the SD defect condition. ***Note:*** *The user must also set Bit 0 (Transmit AIS-P Enable) to "1" to configure the Receive STS-1 TOH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.*
3	Unused	R/O	
2	Transmit AIS-P (Down-stream) upon LOF	R/W	**Transmit Path AIS upon declaration of the Loss of Frame (LOF) defect:** This READ/WRITE bit-field permits the user to configure the Receive STS-1 TOH Processor block to automatically transmit a Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards the corresponding Receive STS-1 POH Processor block), anytime (and for the duration that) it declares the LOF defect condition. 0 – Does not configure the Receive STS-1 TOH Processor block to transmit the AIS-P indicator (via the "downstream" traffic) upon declaration of the LOF defect. 1 – Configures the Receive STS-1 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic) anytime (and for the duration that) it declares the LOF defect

			condition. ***Note:*** *The user must also set Bit 0 (Transmit AIS-P Enable) to "1" to configure the Receive STS-1 TOH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.*
1	Transmit AIS-P (Down-stream) upon LOS	R/W	**Transmit Path AIS upon declaration of the Loss of Signal (LOS) defect:** This READ/WRITE bit-field permits the user to configure the Receive STS-1 TOH Processor block to automatically transmit a Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards the corresponding Receive STS-1 POH Processor block), anytime (and for the duration that) it declares the LOS defect condition. 0 – Does not configure the Receive STS-1 TOH Processor block to transmit the AIS-P indicator (via the "downstream" traffic) anytime it declares the LOS defect condition. 1 – Configures the Receive STS-1 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic) anytime (and for the duration that) it declares the LOS defect condition. ***Note:*** *The user must also set Bit 0 (Transmit AIS-P Enable) to "1" to configure the Receive STS-1 TOH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.*
0	AUTO AIS	R/W	**Automatic Transmission of AIS-P Enable:** This READ/WRITE bit-field serves two purposes. It permits the user to configure the Receive STS-1 TOH Processor block to automatically transmit the Path AIS (AIS-P) indicator, via the down-stream traffic (e.g., towards the Receive STS-1 POH Processor block), upon detection of an SF, SD, Section Trace Mismatch, Section Trace Unstable, LOF or LOS defect conditions. It also permits the user to configure the Receive STS-1 TOH Processor block to automatically transmit a Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards the Receive STS-1 POH Processor block) anytime it declares the AIS-L defect condition within the "incoming" STS-1 datastream. 0 – Configures the Receive STS-1 TOH Processor block to NOT automatically transmit the AIS-P indicator (via the "downstream" traffic) upon declaration of the AIS-L defect condition or any of the "above-mentioned" defect conditions. 1 – Configures the Receive STS-1 TOH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic) upon declaration of the AIS-L defect or any of the "above-mentioned" defect conditions. ***Note:*** *The user must also set the corresponding bit-fields (within this register) to "1" in order to configure the Receive STS-1 TOH Processor block to automatically transmit the AIS-P indicator upon declaration of a given alarm/defect condition.*

Table 505: Receive STS-1 Transport – Auto AIS (in Downstream STS-1s) Control Register (Address Location= 0xN16B, where N ranges in value from 0x05 to 0x07)

5	Transmit AIS-P (via Downstream STS-1s) upon LOS	R/W	**Transmit AIS-P (via Downstream STS-1s) upon declaration of the LOS (Loss of Signal) defect condition:** This READ/WRITE bit-field permits the user to configure the Transmit SONET POH Processor block (in the corresponding channel) to automatically transmit the AIS-P (Path AIS) Indicator via the "downstream" STS-1 signal (within the outbound STS-3 signal), anytime (and for the duration that) the Receive STS-1 TOH Processor block declares the LOS defect condition. 0 – Does not configure the corresponding Transmit SONET POH Processor blocks to automatically transmit the AIS-P Indicator via the "downstream" STS-1 signal (within the outbound STS-3 signal), anytime the Receive STS-1 TOH Processor block declares the LOS defect condition. 1 – Configures the corresponding Transmit SONET POH Processor blocks to automatically transmit the AIS-P Indicator via the "downstream" STS-1 signals (within the outbound STS-3 signal), anytime (and for the duration that) the Receive STS-1 TOH Processor block declares the LOS defect condition. ***Note:*** *1. In the "long-run" the function of this bit-field is exactly the same as that of Bit 1 (Transmit AIS-P Down-stream – Upon LOS), within the Receive STS-1 Transport – Auto AIS Control Register (Address Location= 0xN163). The only difference is that this register bit will cause the corresponding "downstream" Transmit SONET POH Processor block to IMMEDIATELY begin to transmit the AIS-P condition whenever the Receive STS-1 TOH Processor block declares the LOS defect. This will permit the user to easily comply with the Telcordia GR-253-CORE requirements of an NE transmitting the AIS-P indicator downstream within 125us of the NE declaring the LOS defect.* *In the case of Bit 1 (Transmit AIS-P Downstream – Upon LOS), several SONET frame periods are required (after the Receive STS-1 TOH Processor block has declared the LOS defect), before the corresponding Transmit SONET POH Processor block will begin the process of transmitting the AIS-P indicator.* *2. In addition to setting this bit-field to "1", the user must also set Bit 0 (Transmit AIS-P via Downstream STS-1s Enable) within this register, in order enable this feature.*
4	Transmit AIS-P (via Downstream STS-1s) upon LOF	R/W	**Transmit AIS-P (via Downstream STS-1s) upon declaration of the LOF (Loss of Frame) defect condition:**

			This READ/WRITE bit-field permits the user to configure the Transmit SONET POH Processor block (in the corresponding channel) to automatically transmit the AIS-P (Path AIS) Indicator via the "downstream" STS-1 signal (within the outbound STS-3 signal), anytime (and for the duration that) the Receive STS-1 TOH Processor block declares the LOF defect condition. 0 – Does not configure the corresponding Transmit SONET POH Processor block to automatically transmit the AIS-P Indicator via the "downstream" STS-1 signals (within the outbound STS-3 signal), anytime the Receive STS-1 TOH Processor block declares the LOF defect condition. 1 – Configures the corresponding Transmit SONET POH Processor block to automatically transmit the AIS-P Indicator via the "downstream" STS-1 signals (within the outbound STS-3 signal), anytime (and for the duration that) the Receive STS-1 TOH Processor block declares the LOF defect condition. ***Note:*** *1. In the "long-run" the function of this bit-field is exactly the same as that of Bit 2 (Transmit AIS-P Down-stream – Upon LOF), within the Receive STS-1 Transport – Auto AIS Control Register (Address Location= 0xN163). The only difference is that this register bit will cause the corresponding "downstream" Transmit SONET POH Processor blocks to IMMEDIATELY begin to transmit the AIS-P condition whenever the Receive STS-1 TOH Processor block declares the LOF defect. This will permit the user to easily comply with the Telcordia GR-253-CORE requirements of an NE transmitting the AIS-P indicator downstream within 125us of the NE declaring the LOF defect.* *In the case of Bit 2 (Transmit AIS-P Downstream – Upon LOF), several SONET frame periods are required (after the Receive STS-3 TOH Processor block has declared the LOS defect), before the corresponding Transmit SONET POH Processor block will begin the process of transmitting the AIS-P indicator.* *2. In addition to setting this bit-field to "1", the user must also set Bit 0 (Transmit AIS-P via Downstream STS-1s Enable) within this register, in order enable this feature.*
3	Transmit AIS-P (via Downstream STS-1s) upon SD	R/W	**Transmit AIS-P (via Downstream STS-1s) upon declaration of the SD (Signal Degrade) defect condition:** This READ/WRITE bit-field permits the user to configure the Transmit SONET POH Processor block (in the corresponding channel) to automatically transmit the AIS-P (Path AIS) Indicator via the "downstream" STS-1 signals (within the outbound STS-3 signal), anytime (and for the duration that) the Receive STS-1 TOH Processor block declares the SD defect condition. 0 – Does not configures the corresponding Transmit SONET POH Processor block to automatically transmit the AIS-P Indicator via the "downstream" STS-1 signals (within the outbound STS-3 signal), anytime the Receive STS-1 TOH Processor block declares the SD defect condition. 1 – Configures the corresponding Transmit SONET POH Processor block to automatically transmit the AIS-P Indicator via the "downstream" STS-1 signal (within the outbound STS-3 signal), anytime (and for the duration that) the Receive STS-1 TOH Processor block declares the SD defect condition. ***Note:*** *1. In the "long-run" the function of this bit-field is exactly the same as that of Bit 4 (Transmit AIS-P Down-stream – Upon SD), within the*

			Receive STS-1 Transport – Auto AIS Control Register (Address Location= 0xN163). The only difference is that this register bit will cause the corresponding "downstream" Transmit SONET POH Processor blocks to IMMEDIATELY begin to transmit the AIS-P condition whenever the Receive STS-1 TOH Processor block declares the SD defect. This will permit the user to easily comply with the Telcordia GR-253-CORE requirements of an NE transmitting the AIS-P indicator downstream within 125us of the NE declaring the LOS defect. *In the case of Bit 1 (Transmit AIS-P Downstream – Upon LOF), several SONET frame periods are required (after the Receive STS-1 TOH Processor block has declared the SD defect), before the corresponding Transmit SONET POH Processor block will begin the process of transmitting the AIS-P indicator.* *2. In addition to setting this bit-field to "1", the user must also set Bit 0 (Transmit AIS-P via Downstream STS-1s Enable) within this register, in order enable this feature.*
2	Transmit AIS-P (via Downstream STS-1s) upon SF	R/W	**Transmit AIS-P (via Downstream STS-1s) upon declaration of the Signal Failure (SF) defect condition:** This READ/WRITE bit-field permits the user to configure the Transmit SONET POH Processor block (in the corresponding channel) to automatically transmit the AIS-P (Path AIS) Indicator via the "downstream" STS-1 signal (within the outbound STS-3 signal), anytime (and for the duration that)) the Receive STS-1 TOH Processor block declares the SF defect condition. 0 – Does not configures the corresponding Transmit SONET POH Processor block to automatically transmit the AIS-P Indicator via the "downstream" STS-1 signal (within the outbound STS-3 signal), anytime the Receive STS-1 TOH Processor block declares the SF defect condition. 1 – Configures the corresponding Transmit SONET POH Processor block to automatically transmit the AIS-P Indicator via the "downstream" STS-1 signal (within the outbound STS-3 signal), anytime (and for the duration that) the Receive STS-1 TOH Processor block declares the SF defect condition. ***Note:*** *In the "long-run" the function of this bit-field is exactly the same as that of Bit 5 (Transmit AIS-P Down-stream – Upon SF), within the Receive STS-1 Transport – Auto AIS Control Register (Address Location= 0xN163). The only difference is that this register bit will cause the corresponding "downstream" Transmit SONET POH Processor blocks to IMMEDIATELY begin to transmit the AIS-P condition whenever the Receive STS-1 TOH Processor block declares the SF defect. This will permit the user to easily comply with the Telcordia GR-253-CORE requirements of an NE transmitting the AIS-P indicator downstream within 125us of the NE declaring the SF defect.* *In the case of Bit 5 (Transmit AIS-P Downstream – Upon SF), several SONET frame periods are required (after the Receive STS-1 TOH Processor block has declared the SF defect), before the corresponding Transmit SONET POH Processor blocks will begin the process of transmitting the AIS-P indicator.* *2. In addition to setting this bit-field to "1", the user must also set Bit 0 (Transmit AIS-P via Downstream STS-1s Enable) within this register, in order enable this feature.*
1	Unused	R/O	
0	Transmit AIS-P (via Downstream STS-1s)	R/W	**Automatic Transmission of AIS-P (via the downstream STS-1s) Enable**:

	Enable		**Enable**: This READ/WRITE bit-field serves two purposes. It permits the user to configure the corresponding Transmit SONET POH Processor block to automatically transmit the AIS-P indicator, via its "outbound" STS-1 signal (within the outbound STS-3 signal), upon declaration of either the SF, SD, LOS or LOF defect conditions via the Receive STS-1 TOH Processor block. It also permits the user to configure the corresponding Transmit SONET POH Processor block to automatically transmit the AIS-P indicator, via its "outbound" STS-1 signal (within the outbound STS-3 signal), upon declaration of the AIS-L defect condition, via the Receive STS-1 TOH Processor block. 0 – Does not configure the corresponding Transmit SONET POH Processor block to automatically transmit the AIS-P indicator, whenever the Receive STS-1 TOH Processor block declares either the LOS, LOF, SD, SF or AIS-L defect conditions. 1 – Configures the corresponding Transmit SONET POH Processor block to automatically transmit the AIS-P indicator, whenever (and for the duration that) the Receive STS-1 TOH Processor block declares either the LOS, LOF, SD, SF or AIS-L defect conditions.

0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 4	Unused	R/O	
3	Check Stuff	R/W	**Check (Pointer Adjustment) Stuff Select:** This READ/WRITE bit-field permits the user to enable/disable the SONET standard recommendation that a pointer increment or decrement operation, detected within 3 SONET frames of a previous pointer adjustment operation (e.g., negative stuff, positive stuff) is ignored. 0 – Disables this SONET standard implementation. In this mode, all pointer-adjustment operations that are detected will be accepted. 1 – Enables this "SONET standard" implementation. In this mode, all pointer-adjustment operations that are detected within 3 SONET frame periods of a previous pointer-adjustment operation will be ignored.
2	RDI-P Type	R/W	**Path - Remote Defect Indicator Type Select:** This READ/WRITE bit-field permits the user to configure the Receive STS-1 POH Processor block to support either the "Single-Bit" or the "Enhanced" RDI-P form of signaling, as described below. 0 – Configures the Receive STS-1 POH Processor block to support Single-Bit RDI-P. In this mode, the Receive STS-1 POH Processor block will only monitor Bit 5, within the G1 byte (of the incoming SPE data), in order to declare and clear the RDI-P defect condition. 1 – Configures the Receive STS-1 POH Processor block to support Enhanced RDI-P (ERDI-P). In this mode, the Receive STS-1 POH Processor block will monitor bits 5, 6 and 7, within the G1 byte, in order to declare and clear the RDI-P defect condition.
1	REI-P Error Type	R/W	**REI-P Error Type:** This READ/WRITE bit-field permits the user to specify how the Receive STS-1 POH Processor block will count (or tally) REI-P events, for Performance Monitoring purposes. The user can configure the Receive STS-1 POH Processor block to increment REI-P events on either a "per-bit" or "per-frame" basis. If the user configures the Receive STS-1 POH Processor block to increment REI-P events on a "per-bit" basis, then it will increment the "Receive STS-1 Path REI-P Error Count" register by the value of the lower nibble within the G1 byte of the incoming STS-1 data-stream. If the user configures the Receive STS-1 POH Processor block to increment REI-P events on a "per-frame" basis, then it will increment the "Receive STS-1 Path REI-P Error Count" register each time it receives an STS-1 frame, in which the lower nibble of the G1 byte (bits 1 through 4) are set to a "non-zero" value. 0 – Configures the Receive STS-1 POH Processor block to count or tally REI-P events on a per-bit basis. 1 – Configures the Receive STS-1 POH Processor block to count or tally REI-

			P events on a “per-frame” basis.
0	B3 Error Type	R/W	**B3 Error Type:** This READ/WRITE bit-field permits the user to specify how the Receive STS-1 POH Processor block will count (or tally) B3 byte errors, for Performance Monitoring purposes. The user can configure the Receive STS-1 POH Processor block to increment B3 byte errors on either a “per-bit” or “per-frame” basis. If the user configures the Receive STS-1 POH Processor block to increment B3 byte errors on a “per-bit” basis, then it will increment the “Receive STS-1 Path B3 Byte Error Count” register by the number of bits (within the B3 byte value of the incoming STS-1 data-stream) that is in error. If the user configures the Receive STS-1 POH Processor block to increment B3 byte errors on a “per-frame” basis, then it will increment the “Receive STS-1 Path - B3 Byte Error Count” register each time it receives an STS-1 SPE that contains an erred B3 byte. 0 – Configures the Receive STS-1 POH Processor block to count B3 byte errors on a “per-bit” basis 1 – Configures the Receive STS-1 POH Processor block to count B3 byte errors on a “per-frame” basis.

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	TIM-P Defect Declared	R/O	**Trace Identification Mismatch (TIM-P) Defect Indicator:** This READ-ONLY bit-field indicates whether or not the Receive STS-1 POH Processor block is currently declaring the "Path Trace Identification Mismatch" (TIM-P) defect condition. The Receive STS-1 POH Processor block will declare the "TIM-P" defect condition, when none of the received 64-byte string (received via the J1 byte, within the incoming STS-1 data-stream) matches the expected 1, 16 or 64-byte message. The Receive STS-1 POH Processor block will clear the "TIM-P" defect condition, when 80% of the received 1, 16 or 64-byte string (received via the J1 byte) matches the expected 1, 16 or 64-byte message. 0 – Indicates that the Receive STS-1 POH Processor block is NOT currently declaring the TIM-P defect condition. 1 – Indicates that the Receive STS-1 POH Processor block is currently declaring the TIM-P defect condition.
6	C2 Byte Unstable Defect Declared	R/O	**C2 Byte (Path Signal Label Byte) Unstable Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-1 POH Processor block is currently declaring the "Path Signal Label Byte" Unstable defect condition. The Receive STS-1 POH Processor block will declare the C2 (Path Signal Label Byte) Unstable defect condition, whenever the "C2 Byte Unstable" counter reaches the value "5". The "C2 Byte Unstable" counter will be incremented for each time that it receives an SPE with a C2 byte value that differs from the previously received C2 byte value. The "C2 Byte Unstable" counter is cleared to "0" whenever the Receive STS-1 POH Processor block has received 3 (or 5) consecutive SPEs that each contains the same C2 byte value. ***Note:*** *Receiving a given C2 byte value in 3 (or 5) consecutive SPEs also sets this bit-field to "0".* 0 – Indicates that the Receive STS-1 POH Processor block is currently NOT declaring the C2 (Path Signal Label Byte) Unstable defect condition. 1 – Indicates that the Receive STS-1 POH Processor block is currently declaring the C2 (Path Signal Label Byte) Unstable defect condition.
5	UNEQ-P Defect Declared	R/O	**Path – Unequipped (UNEQ-P) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-1 POH Processor block is currently declaring the UNEQ-P defect condition. The Receive STS-1 POH Processor block will declare the UNEQ-P defect condition anytime that it receives at least five (5) consecutive STS-1 frames, in which the C2 byte was set to the value "0x00" (which indicates that the SPE is

			"Unequipped"). The Receive STS-1 POH Processor block will clear the UNEQ-P defect condition, if it receives at least five (5) consecutive STS-1 frames, in which the C2 byte was set to a value other than 0x00. 0 – Indicates that the Receive STS-1 POH Processor block is currently NOT declaring the UNEQ-P defect condition. 1 – Indicates that the Receive STS-1 POH Processor block is currently declaring the UNEQ-P defect condition. ***Note:*** *The Receive STS-1 POH Processor block will not declare the UNEQ-P defect condition if it configured to expect to receive STS-1 frames with C2 bytes being set to "0x00" (e.g., if the "Receive STS-1 Path – Expected Path Label Value" Register is set to "0x00").*
4	PLM-P Defect Declared	R/O	**Path Payload Mismatch (PLM-P) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-1 POH Processor block is currently declaring the PLM-P defect condition. The Receive STS-1 POH Processor block will declare the PLM-P defect condition, if it receives at least five (5) consecutive STS-1 frames, in which the C2 byte was set to a value other than that which it is expecting to receive. Whenever the Receive STS-1 POH Processor block is determining whether or not it should declare the PLM-P defect, it will check the contents of the following two registers. • The "Receive STS-1 Path – Received Path Label Value" Register (Address Location= 0xN196). • The "Receive STS-1 Path – Expected Path Label Value" Register (Address Location= 0xN197). The "Receive STS-1 Path – Expected Path Label Value" Register contains the value of the C2 bytes, that the Receive STS-1 POH Processor blocks expects to receive. The "Receive STS-1 Path – Received Path Label Value" Register contains the value of the C2 byte, that the Receive STS-1 POH Processor block has most received "validated" (by receiving this same C2 byte in five consecutive STS-1 frames). The Receive STS-1 POH Processor block will declare the PLM-P defect condition if the contents of these two register do not match. The Receive STS-1 POH Processor block will clear the PLM-P defect condition if whenever the contents of these two registers do match. 0 – Indicates that the Receive STS-1 POH Processor block is currently NOT declaring the PLM-P defect condition. 1 – Indicates that the Receive STS-1 POH Processor block is currently declaring the PLM-P defect condition. ***Note:*** *The Receive STS-1 POH Processor block will clear the PLM-P defect, upon declaring the UNEQ-P defect condition.*
3	RDI-P Defect Declared	R/O	**Path Remote Defect Indicator (RDI-P) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-1 POH Processor block is currently declaring the RDI-P defect condition. If the Receive STS-1 POH Processor block is configured to support the "Single-bit RDI-P" function, then it will declare the RDI-P defect condition if Bit 5 (within the G1 byte of the incoming STS-1 frame) is set to "1" for "RDI-P_THRD" number of incoming consecutive STS-1 SPEs. If the Receive STS-1 POH Processor block is configured to support the Enhanced RDI-P" (ERDI-P) function, then it will declare the RDI-P defect condition if Bits 5, 6

			and 7 (within the G1 byte of the incoming STS-1 frame) are set to [0, 1, 0], [1, 0, 1] or [1, 1, 0] for "RDI-P_THRD" number of consecutive STS-1 frames. 0 – Indicates that the Receive STS-1 POH Processor block is NOT currently declaring the RDI-P defect condition. 1 – Indicates that the Receive STS-1 POH Processor block is currently declaring the RDI-P defect condition. ***Note:*** *The user can specify the value for "RDI-P_THRD" by writing the appropriate data into Bits 3 through 0 (RDI-P THRD) within the "Receive STS-1 Path – SONET Receive RDI-P Register (Address Location= 0xN193).*
2	RDI-P Unstable Defect Declared	R/O	**RDI-P (Path – Remote Defect Indicator) Unstable Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-1 POH Processor block is currently declaring the "RDI-P Unstable" defect condition. The Receive STS-1 POH Processor block will declare the "RDI-P Unstable" defect condition whenever the "RDI-P Unstable Counter" reaches the value "RDI-P THRD". The "RDI-P Unstable" counter is incremented for each time that the Receive STS-1 POH Processor block receives an RDI-P value that differs from that of the previous STS-1 frame. The "RDI-P Unstable" counter is cleared to "0" whenever the same RDI-P value is received in "RDI-P_THRD" consecutive STS-1 frames. ***Note:*** *Receiving a given RDI-P value, in "RDI-P_THRD" consecutive STS-1 frames also clears this bit-field to "0".* 0 – Indicates that the Receive STS-1 POH Processor block is NOT currently declaring the "RDI-P Unstable" defect condition. 1 – Indicates that the Receive STS-1 POH Processor block is currently declaring the "RDI-P Unstable" defect condition. ***Note:*** *The user can specify the value for "RDI-P_THRD" by writing the appropriate data into Bits 3 through 0 (RDI-P THRD) within the "Receive STS-1 Path – SONET Receive RDI-P Register (Address Location= 0xN193).*
1	LOP-P Defect Declared	R/O	**Loss of Pointer Indicator (LOP-P) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-1 POH Processor block is currently declaring the LOP-P (Loss of Pointer) defect condition. The Receive STS-1 POH Processor block will declare the LOP-P defect condition, if it cannot detect a valid pointer (H1 and H2 bytes, within the TOH) within 8 to 10 consecutive SONET frames. Further, the Receive STS-1 POH Processor block will declare the LOP-P defect condition, if it detects 8 to 10 consecutive NDF events. The Receive STS-1 POH Processor block will clear the LOP-P defect condition, whenever it detects valid pointer bytes (e.g., the H1 and H2 bytes, within the TOH) and normal NDF value for three consecutive incoming STS-1 frames. 0 – Indicates that the Receive STS-1 POH Processor block is NOT declaring the LOP-P defect condition. 1 – Indicates that the Receive STS-1 POH Processor block is currently declaring the LOP-P defect condition.
0	AIS-P Defect Declared	R/O	**Path AIS (AIS-P) Defect Declared:** This READ-ONLY bit-field indicates whether or not the Receive STS-1 POH Processor block is currently declaring the AIS-P defect condition. The Receive STS-1 POH Processor block will declare the AIS-P defect condition if it detects all of the following conditions within three consecutive incoming STS-1 frames. • The H1, H2 and H3 bytes are set to an "All Ones" pattern.

			• The entire SPE is set to an “All Ones” pattern. The Receive STS-1 POH Processor block will clear the AIS-P defect condition when it detects a valid STS-1 pointer (H1 and H2 bytes) and a “set” or “normal” NDF for three consecutive STS-1 frames. 0 – Indicates that the Receive STS-1 POH Processor block is NOT currently declaring the AIS-P defect condition. 1 – Indicates that the Receive STS-1 POH Processor block is currently declaring the AIS-P defect condition. ***Note:*** *The Receive STS-1 POH Processor block will NOT declare the LOP-P defect condition if it detects an “All Ones” pattern in the H1, H2 and H3 bytes. It will, instead, declare the AIS-P defect condition.*

Table 509: Receive STS-1 Path – SONET Receive Path Interrupt Status – Byte 2 (Address Location= 0xN189, where N ranges in value from 0x05 to 0x07)

7	Detection of B3 Byte Error Interrupt Status	RUR	**Detection of B3 Byte Error Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of B3 Byte Error" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive STS-1 POH Processor block will generate an interrupt anytime it detects a B3 byte error in the incoming STS-1 data stream. 0 – Indicates that the "Detection of B3 Byte Error" Interrupt has NOT occurred since the last read of this interrupt. 1 – Indicates that the "Detection of B3 Byte Error" Interrupt has occurred since the last read of this interrupt.
6	Detection of New Pointer Interrupt Status	RUR	**Detection of New Pointer Interrupt Status:** This RESET-upon-READ indicates whether the "Detection of New Pointer" interrupt has occurred since the last read of this register. If the user enables this interrupt, then the Receive STS-1 POH Processor block will generate an interrupt anytime it detects a new pointer value in the incoming STS-1 frame. ***Note:*** *Pointer Adjustments with NDF will not generate this interrupt.* 0 – Indicates that the "Detection of New Pointer" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of New Pointer" Interrupt has occurred since the last read of this register.
5	Detection of Unknown Pointer Interrupt Status	RUR	**Detection of Unknown Pointer Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of Unknown Pointer" interrupt has occurred since the last read of this register. If the user enables this interrupt, then the Receive STS-1 POH Processor block will generate an interrupt anytime that it detects a "pointer" that does not fit into any of the following categories. • An Increment Pointer • A Decrement Pointer • An NDF Pointer • An AIS (e.g., All Ones) Pointer • New Pointer

			0 – Indicates that the "Detection of Unknown Pointer" interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of Unknown Pointer" interrupt has occurred since the last read of this register.
4	Detection of Pointer Decrement Interrupt Status	RUR	**Detection of Pointer Decrement Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of Pointer Decrement" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive STS-1 POH Processor block will generate an interrupt anytime it detects a "Pointer Decrement" event. 0 – Indicates that the "Detection of Pointer Decrement" interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of Pointer Decrement" interrupt has occurred since the last read of this register.
3	Detection of Pointer Increment Interrupt Status	RUR	**Detection of Pointer Increment Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of Pointer Increment" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive STS-1 POH Processor block will generate an interrupt anytime it detects a "Pointer Increment" event. 0 – Indicates that the "Detection of Pointer Increment" interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of Pointer Increment" interrupt has occurred since the last read of this register.
2	Detection of NDF Pointer Interrupt Status	RUR	**Detection of NDF Pointer Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Detection of NDF Pointer" interrupt has occurred since the last read of this register. If the user enables this interrupt, then the Receive STS-1 POH Processor block will generate an interrupt anytime it detects an NDF Pointer event. 0 – Indicates that the "Detection of NDF Pointer" interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Detection of NDF Pointer" interrupt has occurred since the last read of this register.
1	Change of LOP-P Defect Condition Interrupt Status	RUR	**Change of LOP-P Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change in LOP-P Defect Condition" interrupt has occurred since the last read of this register. If the user enables this interrupt, then the Receive STS-1 POH Processor block will generate an interrupt in response to either of the following events. • Whenever the Receive STS-1 POH Processor block declares the LOP-P defect condition. • Whenever the Receive "STS-1 POH Processor" block clears the LOP-P defect condition. 0 – Indicates that the "Change in LOP-P Defect Condition" interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change in LOP-P Defect Condition" interrupt has

			occurred since the last read of this register. ***Note:*** *The user can determine if the Receive STS-1 POH Processor block is currently declaring the LOP-P defect condition by reading out the state of Bit 1 (LOP-P Defect Declared) within the "Receive STS-1 Path – SONET Receive POH Status – Byte 0" Register (Address Location=0xN187).*
0	Change of AIS-P Defect Condition Interrupt Status	RUR	**Change of AIS-P Defect Condition Interrupt Status:** This RESET-upon-READ bit-field indicates whether or not the "Change of AIS-P Defect Condition" Interrupt has occurred since the last read of this register. If this interrupt is enabled, then the Receive STS-1 POH Processor block will generate an interrupt in response to either of the following events. • Whenever the Receive STS-1 POH Processor block declares the AIS-P defect condition. • Whenever the Receive STS-1 POH Processor block clears the AIS-P defect condition. 0 – Indicates that the "Change of AIS-P Defect Condition" Interrupt has NOT occurred since the last read of this register. 1 – Indicates that the "Change of AIS-P Defect Condition" Interrupt has occurred since the last read of this register. ***Note:*** *The user can determine if the Receive STS-1 POH Processor block is currently declaring the AIS-P defect condition by reading out the state of Bit 0 (AIS-P Defect Declared) within the "Receive STS-1 Path – SONET Receive POH Status – Byte 0" Register (Address Location= 0xN187).*

7	Detection of B3 Byte Error Interrupt Enable	R/W	**Detection of B3 Byte Error Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of B3 Byte Error" Interrupt. If the user enables this interrupt, then the Receive STS-1 POH Processor block will generate an interrupt anytime it detects a B3-byte error in the incoming STS-1 data-stream. 0 – Disables the "Detection of B3 Byte Error" interrupt. 1 – Enables the "Detection of B3 Byte Error" interrupt.
6	Detection of New Pointer Interrupt Enable	R/W	**Detection of New Pointer Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of New Pointer" interrupt. If the user enables this interrupt, then the Receive STS-1 POH Processor block will generate an interrupt anytime it detects a new pointer value in the incoming STS-1 frame. ***Note:*** *Pointer Adjustments with NDF will not generate this interrupt.* 0 – Disables the "Detection of New Pointer" Interrupt. 1 – Enables the "Detection of New Pointer" Interrupt.
5	Detection of Unknown Pointer Interrupt Enable	R/W	**Detection of Unknown Pointer Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of Unknown Pointer" interrupt. If the user enables this interrupt, then the Receive STS-1 POH Processor block will generate an interrupt anytime it detects a "Pointer Adjustment" that does not fit into any of the following categories. • An Increment Pointer. • A Decrement Pointer • An NDF Pointer • AIS Pointer • New Pointer. 0 – Disables the "Detection of Unknown Pointer" Interrupt. 1 – Enables the "Detection of Unknown Pointer" Interrupt.
4	Detection of Pointer Decrement Interrupt Enable	R/W	**Detection of Pointer Decrement Interrupt Enable:** This READ/WRITE bit-field permits the user to enable or disable the "Detection of Pointer Decrement" Interrupt. If the user enables this interrupt, then the Receive STS-1 TOH Processor block will generate an interrupt anytime it detects a "Pointer-Decrement" event.

			0 – Disables the "Detection of Pointer Decrement" Interrupt. 1 – Enables the "Detection of Pointer Decrement" Interrupt.
3	Detection of Pointer Increment Interrupt Enable	R/W	**Detection of Pointer Increment Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of Pointer Increment" Interrupt. If the user enables this interrupt, then the Receive STS-1 POH Processor block will generate an interrupt anytime it detects a "Pointer Increment" event. 0 – Disables the "Detection of Pointer Increment" Interrupt. 1 – Enables the "Detection of Pointer Increment" Interrupt.
2	Detection of NDF Pointer Interrupt Enable	R/W	**Detection of NDF Pointer Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Detection of NDF Pointer" Interrupt. If the user enables this interrupt, then the Receive STS-1 POH Processor block will generate an interrupt anytime it detects an NDF Pointer event. 0 – Disables the "Detection of NDF Pointer" interrupt. 1 – Enables the "Detection of NDF Pointer" interrupt.
1	Change of LOP-P Defect Condition Interrupt Enable	R/W	**Change of LOP-P Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change in LOP (Loss of Pointer)" Defect Condition interrupt. If the user enables this interrupt, then the Receive STS-1 POH Processor block will generate an interrupt in response to either of the following events. • Whenever the Receive STS-1 POH Processor block declares the LOP-P defect condition condition. • Whenever the Receive STS-1 POH Processor block clears the LOP-P defect condition. 0 – Disable the "Change of LOP-P Defect Condition" Interrupt. 1 – Enables the "Change of LOP-P Defect Condition" Interrupt. ***Note:*** *The user can determine if the Receive STS-1 POH Processor block is currently declaring the LOP-P defect condition by reading out the contents of Bit 1 (LOP-P Defect Declared) within the "Receive STS-1 Path – SONET Receive POH Status – Byte 0" (Address Location= 0xN187).*
0	Change of AIS-P Defect Condition Interrupt Enable	R/W	**Change of AIS-P Defect Condition Interrupt Enable:** This READ/WRITE bit-field permits the user to either enable or disable the "Change of AIS-P (Path AIS)" Defect Condition interrupt. If the user enables this interrupt, then the Receive STS-1 POH Processor block will generate an interrupt in response to either of the following events. • Whenever the Receive STS-1 POH Processor block declares the AIS-P Defect condition. • Whenever the Receive STS-1 POH Processor block clears the AIS-P Defect condition. 0 – Disables the "Change of AIS-P Defect Condition" Interrupt. 1 – Enables the "Change of AIS-P Defect Condition" Interrupt. ***Note:*** *The user can determine if the Receive STS-1 POH Processor block is currently declaring the AIS-P defect condition by reading out the contents of Bit 0 (AIS-P Defect Declared) within the "Receive STS-1 Path – SONET Receive POH Status – Byte 0" (Address Location= 0xN187).*

Table 515: Receive STS-1 Path – SONET Receive RDI-P Register (Address Location= 0xN193, where N ranges in value from 0x05 to 0x07)

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 6	Unused	R/O	
5	New Message Ready	R/O	**New Message Ready:** This READ/WRITE bit-field indicates whether or not the Receive STS-1 POH Processor block has (1) accepted a new Receive Path Trace Message, and (2) has loaded this new message into the Receive Path Trace Message buffer, since the last read of this register. 0 – Indicates that the Receive STS-1 POH Processor block has (1) NOT accepted a new Path Trace Message, nor (2) has the Receive STS-1 POH Processor block loaded any new message into the Receive Path Trace Message buffer, since the last read of this register. 1 – Indicates that the Receive STS-1 POH Processor block has (1) accepted a new Path Trace Message, and (2) has loaded this new message into the Receive Path Trace Message buffer, since the last read of this register.
4	Receive Path Trace Message Buffer Read Select	R/W	**Receive Path Trace Message Buffer Read Selection:** This READ/WRITE bit-field permits a user to specify which of the following Receive Path Trace Message buffer segments that the Microprocessor will read out, whenever it reads out the contents of the Receive Path Trace Message Buffer. a. The "Actual" Receive Path Trace Message Buffer. The "Actual" Receive Path Trace Message Buffer contains the contents of the most recently received (and accepted) Path Trace Message via the incoming STS-1 data-stream. b. The "Expected" Receive Path Trace Message Buffer. The "Expected" Receive Path Trace Message Buffer contains the contents of the Path Trace Message that the user "expects" to receive. The contents of this particular buffer are usually specified by the user. 0 – Executing a READ to the Receive Path Trace Message Buffer, will return contents within the "Actual" Receive Path Trace Message buffer. 1 – Executing a READ to the Receive Path Trace Message Buffer will return contents within the "Expected Receive Path Trace Message Buffer". ***Note:*** *In the case of the Receive STS-1 POH Processor block, the "Receive Path Trace Message Buffer" is located at Address Location 0xN500 through 0xN53F.*

<table>
<tr><td>3</td><td>Path Trace Message Accept Threshold</td><td>R/W</td><td>Path Trace Message Accept Threshold:

This READ/WRITE bit-field permits a user to select the number of consecutive times that the Receive STS-1 POH Processor block must receive a given Receive Path Trace Message, before it is accepted and loaded into the “Actual” Receive Path Trace Message buffer, as described below.

0 – Configures the Receive STS-1 POH Processor block to accept the incoming Path Trace Message after it has received it the third time in succession.

1 – Configures the Receive SONET POH Processor block to accept the incoming Path Trace Message after it has received in the fifth time in succession.</td></tr>
<tr><td>2</td><td>Path Trace Message Alignment Type</td><td>R/O</td><td>Path Trace Message Alignment Type:

This READ/WRITE bit-field permits a user to specify how the Receive STS-1 POH Processor block will locate the boundary of the incoming Path Trace Message (within the incoming STS-1 data-stream), as indicated below.

0 – Configures the Receive STS-1 POH Processor block to expect the Path Trace Message boundary to be denoted by a “Line Feed” character.

1 – Configures the Receive STS-1 POH Processor block to expect the Path Trace Message boundary to be denoted by the presence of a “1” in the MSB (most significant bit) of the very first byte (within the incoming Path Trace Message). In this case, all of the remaining bytes (within the incoming Path Trace Message) will each have a “0” within their MSBs.</td></tr>
<tr><td>1 – 0</td><td>Receive Path Trace Message Length[1:0]</td><td>R/W</td><td>Receive Path Trace Message Length[1:0]:

These READ/WRITE bit-fields permit the user to specify the length of the Receive Path Trace Message that the Receive STS-1 POH Processor block will accept and load into the “Actual” Receive Path Trace Message Buffer. The relationship between the content of these bit-fields and the corresponding Receive Path Trace Message Length is presented below.

<table>
<tr><th>Receive Path Trace Message Length[1:0]</th><th>Resulting Path Trace Message Length (in terms of bytes)</th></tr>

5	Transmit AIS-P (Downstream) upon UNEQ-P	R/W	**Transmit Path AIS (Downstream, towards the corresponding Transmit SONET POH Processor block) upon Declaration of the UNEQ-P (Path – Unequipped) Defect Condition:** This READ/WRITE bit-field permits the user to configure the Receive STS-1 POH Processor block to automatically transmit the Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards the corresponding Transmit SONET POH Processor block), anytime (and for the duration that) it declares the UNEQ-P defect condition. 0 – Does not configure the Receive STS-1 POH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the corresponding Transmit SONET POH Processor block) whenever it declares the UNEQ-P defect condition. 1 – Configures the Receive STS-1 POH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the corresponding Transmit SONET POH Processor block) whenever (and for the duration that) it declares the UNEQ-P

			defect condition. ***Note:*** *The user must also set Bit 0 (Transmit AIS-P Enable) to "1" to configure the Receive STS-1 POH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.*
4	Transmit AIS-P (Downstream) upon PLM-P	R/W	**Transmit Path AIS (Downstream, towards the corresponding Transmit SONET POH Processor block) upon Declaration of the PLM-P (Path – Payload Label Mismatch) Defect Condition:** This READ/WRITE bit-field permits the user to configure the Receive STS-1 POH Processor block to automatically transmit the Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards corresponding Transmit SONET POH Processor block), anytime (and for the duration that) it declares the PLM-P defect condition. 0 – Does not configure the Receive STS-1 POH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the corresponding Transmit SONET POH Processor block) whenever it declares the PLM-P defect condition. 1 – Configures the Receive STS-1 POH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the corresponding Transmit SONET POH Processor block) whenever (and for the duration that) it declares the PLM-P defect condition. ***Note:*** *The user must also set Bit 0 (Transmit AIS-P Enable) to "1" to configure the Receive STS-1 POH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.*
3	Transmit AIS-P (Downstream) upon Path Trace Message Unstable	R/W	**Transmit Path AIS (Downstream, towards the corresponding Transmit SONET POH Processor block) upon declaration of the Path Trace Message Unstable Defect Condition:** This READ/WRITE bit-field permits the user to configure the Receive STS-1 POH Processor block to automatically transmit the Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards the corresponding Transmit SONET POH Processor blocks), anytime (and for the duration that) it declares the Path Trace Message Unstable defect condition within the "incoming" STS-1 data-stream. 0 – Does not configure the Receive STS-1 POH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the corresponding Transmit SONET POH Processor block) whenever it declares the "Path Trace Message Unstable" defect condition. 1 – Configures the Receive STS-1 POH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the corresponding Transmit SONET POH Processor block) whenever it declares the "Path Trace Message Unstable" defect condition. ***Note:*** *The user must also set Bit 0 (Transmit AIS-P Enable) to "1" to configure the Receive STS-1 POH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.*
2	Transmit AIS-P (Downstream) upon TIM-P	R/W	**Transmit Path AIS (Downstream towards the corresponding Transmit SONET POH Processor block) upon declaration of the TIM-P (Path Trace Message Indentification Mismatch) defect condition:** This READ/WRITE bit-field permits the user to configure the Receive STS-1 POH Processor block to automatically transmit a Path AIS

			(AIS-P) Indicator via the "downstream" traffic (e.g., towards the corresponding Transmit SONET POH Processor blocks), anytime (and for the duration that) it declares the TIM-P defect condition within the incoming STS-1 data-stream. 0 – Does not configure the Receive STS-1 POH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic towards the corresponding Transmit SONET POH Processor block) whenever it declares the TIM-P defect condition. 1 – Configures the Receive STS-1 POH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the corresponding Transmit SONET POH Processor block) whenever (and for the duration that) it declares the TIM-P defect condition. ***Note:*** *The user must also set Bit 0 (Transmit AIS-P Enable) to "1" to configure the Receive STS-1 POH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.*
1	Transmit AIS-P (Downstream) upon LOP-P	R/W	**Transmit Path AIS (Downstream, towards the corresponding Transmit SONET POH Processor block) upon Detection of Loss of Pointer (LOP-P) Defect Condition:** This READ/WRITE bit-field permits the user to configure the Receive STS-1 POH Processor block to automatically transmit the Path AIS (AIS-P) Indicator via the "downstream" traffic (e.g., towards the corresponding Transmit SONET POH Processor blocks), anytime (and for the duration that) it declares the LOP-P defect condition within the incoming STS-1 data-stream. 0 – Does not configure the Receive STS-1 POH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the corresponding Transmit SONET POH Processor block) whenever it declares the LOP-P defect condition. 1 – Configures the Receive STS-1 POH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the corresponding Transmit SONET POH Processor block) whenever (and for the duration that) it declares the LOP-P defect condition. ***Note:*** *The user must also set Bit 0 (Transmit AIS-P Enable) to "1" to configure the Receive STS-1 POH Processor block to automatically transmit the AIS-P indicator, in response to this defect condition.*
0	Transmit AIS-P (Downstream) Enable	R/W	**Automatic Transmission of AIS-P Enable:** This READ/WRITE bit-field serves two purposes. It permits the user to configure the Receive STS-1 POH Processor block to automatically transmit the Path AIS (AIS-P) indicator, via the down-stream traffic (e.g., towards the corresponding Transmit SONET POH Processor blocks), upon declaration of either an UNEQ-P, PLM-P, LOP-P or LOS defect condition. It also permits the user to configure the Receive STS-1 POH Processor block to automatically transmit a Path (AIS-P) Indicator via the "downstream" traffic (e.g., towards the corresponding Transmit SONET POH Processor blocks) anytime it declares the AIS-P defect condition within the "incoming " STS-1 data-stream. 0 – Configures the Receive STS-1 POH Processor block to NOT automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the corresponding Transmit SONET POH Processor block) whenever it declares any of the "above-mentioned" defect

			conditions. 1 – Configures the Receive STS-1 POH Processor block to automatically transmit the AIS-P indicator (via the "downstream" traffic, towards the corresponding Transmit SONET POH Processor block) whenever it declares any of the "above-mentioned" defect condition. ***Note:*** *The user must also set the corresponding bit-fields (within this register) to "1" in order to configure the Receive STS-1 POH Processor block to automatically transmit the AIS-P indicator upon detection of a given alarm/defect condition.*

0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7	Unused	R/O	
6	STS-N Overhead Insert	R/W	**STS-N Overhead Insert:** This READ/WRITE bit-field permits the user to configure the TxTOH input port to insert the TOH for all lower-tributary STS-1s within the outbound STS-3 signal. 0 – Disables this feature. In this mode, the TxTOH input port will only accept the TOH for the first STS-1 within the outbound STS-3 signal. 1 – Enables this feature.
5	E2 Byte Insert Method	R/W	**E2 Byte Insert Method:** This READ/WRITE bit-field permits the user to configure the Transmit STS-1 TOH Processor block to use either the contents within the "Transmit STS-1 Transport – E2 Byte Value" Register or the TxTOH input port as the source for the E2 byte, within the outbound STS-3 data-stream, as described below. 0 – Configures the Transmit STS-1 TOH Processor block to accept externally supplied data (via the "TxTOH serial input port) and to insert this data into the E2 byte position within each outbound STS-3 frame. 1 – Configures the Transmit STS-1 TOH Processor block to insert the contents within the "Transmit STS-1 Transport – E2 Byte Value" register (Address Location = 0xN947) into the E2 byte-position, within each outbound STS-3 frame. This configuration selection permits the user to have software control over the value of the E2 byte within the "Transmit Output" STS-3 data-stream.
4	E1 Byte Insert Method	R/W	**E1 Byte Insert Method:** This READ/WRITE bit-field permits the user to configure the Transmit STS-1 TOH Processor block to use either the contents within the "Transmit STS-1 Transport – E1 Byte Value" Register or the TxTOH Input port as the source for the E1 byte, within the outbound STS-3 data-stream, as described below. 0 – Configures the Transmit STS-1 TOH Processor block to accept externally supplied data (via the "TxTOH serial input port) and to insert this data into the E1 byte position within each outbound STS-3 frame. 1 – Configures the Transmit STS-1 TOH Processor block to insert the contents within the "Transmit STS-1 Transport – E1 Byte Value" register (Address Location = 0xN943) into the E1 byte-position, within each outbound STS-3 frame. This configuration selection permits the user to have software control over the value of the E1 byte within the "Transmit Output" STS-3 data-stream.

3	F1 Byte Insert Method	R/W	**F1 Byte Insert Method:** This READ/WRITE bit-field permits the user to configure the Transmit STS-1 TOH Processor block to use either the contents within the "Transmit STS-1 Transport – F1 Byte Value" Register or the TxTOH Input port as the source for the F1 byte, within the outbound STS-3 data-stream, as described below. 0 – Configures the Transmit STS-1 TOH Processor block to accept externally supplied data (via the "TxTOH" serial input port) and to insert this data into the F1 Byte position within each outbound STS-3 frame. 1 – Configures the Transmit STS-1 TOH Processor block to insert the contents within the "Transmit STS-1 Transport – F1 Byte Value" register (Address Location = 0xN93F) into the F1 byte-position, within each outbound STS-3 frame. This configuration selection permits the user to have software control over the value of the F1 byte within the "Transmit Output" STS-3 data-stream.
2	S1 Byte Insert Method	R/W	**S1 Byte Insert Method:** This READ/WRITE bit-field permits the user to configure the Transmit STS-1 TOH Processor block to use either the contents within the "Transmit STS-1 Transport – S1 Byte Value" Register or the TxTOH Input port as the source for the E1 byte, within the outbound STS-3 data-stream, as described below. 0 – Configures the Transmit STS-1 TOH Processor block to accept externally supplied data (via the "TxTOH" serial input port) and to insert this data into the S1 Byte position within each outbound STS-3 frame. 1 – Configures the Transmit STS-1 TOH Processor block to insert the contents within the "Transmit STS-1 Transport – S1 Byte Value" register (Address Location = 0xN93B). This configuration selection permits the user to have software control over the value of the S1 byte within the "Transmit Output" STS-3 data-stream.
1	K1K2 Byte Insert Method	R/W	**K1K2 Byte Insert Method:** This READ/WRITE bit-field permits the user to configure the Transmit STS-1 TOH Processor block to use either the contents within the "Transmit STS-1 Transport – K1 Byte Value" and "Transmit STS-1 Transport – K2 Byte Value" registers or the "TxTOH Input port as the source for the K1 and K2 bytes, within the outbound STS-3 data-stream, as described below. 0 – Configures the Transmit STS-1 TOH Processor block to accept externally supplied data (via the "TxTOH" serial input port) and to insert this data into the K1 and K2 Byte positions within each outbound STS-3 frame. 1 – Configures the Transmit STS-1 TOH Processor block to insert the contents within the "Transmit STS-1 Transport – K1 Byte Value" Register (Address Location = 0xN92E) and the "Transmit STS-1 Transport – K2 Byte Value" register (Address Location = 0xN92F) into the K1 and K2 byte-positions, within each outbound STS-3 frame. This configuration selection permits the user to have software control over the value of the K1 and K2 bytes within the "Transmit Output" STS-3 data-stream.
0	M1 Byte Insert Method[1]	R/W	**M1 Byte Insert Method – Bit 1:** This READ/WRITE bit-field, along with the "M1 Insert Method[0]" bit-field (located in the "Transmit STS-1 Transport – SONET Control Register – Byte 0") permits the user to specify the source of the contents of the M1 byte, within the "transmit" output STS-3 data stream. The relationship between these two bit-fields and the corresponding source of the M1 byte (within each outbound STS-3 frame) is presented

below.

M1 Byte Insert Method[1:0]		Source of M1 Byte
0	0	Functions as the REI-L indicator (based upon the number of B2 byte errors that have been detected by the Receive STS-3 TOH Processor block)
0	1	The M1 byte value is obtained from the contents of the "Transmit STS-1 Transport – M1 Byte Value" register (Address Location = 0xN937). **NOTE:** This configuration selection permits the user to exercise software control over the contents within the M1 byte, of each outbound STS-3 frame.
1	0	The M1 byte value is obtained from the "TxTOH" Serial Input Port.
1	1	Functions as the REI-L bit-field (based upon the number of B2 byte errors that have been detected by the Receive STS-3 TOH Processor block).

<tr><td>5</td><td>Force Transmission of RDI-L</td><td>R/W</td><td>Force Transmission of RDI-L (Line - Remote Defect Indicator):

This READ/WRITE bit-field permits the user to (by software control) force the Transmit STS-1 TOH Processor block to generate and transmit the RDI-L indicator to the remote terminal equipment as described below.

0 – Does not configure the Transmit STS-1 TOH Processor block to generate and transmit the RDI-L indicator. In this setting, the Transmit STS-1 TOH Processor block will only generate and transmit the RDI-L indicator whenever the Receive STS-3 TOH Processor block is</td></tr>
</table>

			declaring a defect condition. 1 – Configures the Transmit STS-1 TOH Processor block to generate and transmit the RDI-L indicator to the remote terminal equipment. In this case, the STS-3 Transmitter will force bits 6, 7 and 8 (of the K2 byte) to the value "1, 1, 0". ***Note:*** *This bit-field is ignored if the Transmit STS-1 TOH Processor block is transmitting the Line AIS (AIS-L) indicator or the LOS pattern.*
4	Force Transmission of AIS-L	R/W	**Force Transmission of AIS-L (Line AIS) Indicator:** This READ/WRITE bit-field permits the user to (by software control) force the Transmit STS-1 TOH Processor block to generate and transmit the AIS-L indicator to the remote terminal equipment, as described below. 0 – Does not configure the Transmit STS-1 TOH Processor block to generate and transmit the AIS-L indicator. In this case, the Transmit STS-1 TOH Processor block will continue to transmit normal traffic to the remote terminal equipment. 1 – Configures the Transmit STS-1 TOH Processor block to generate and transmit the AIS-L indicator to the remote terminal equipment. In this case, the Transmit STS-1 TOH Processor block will force all bits (within the "outbound" STS-3 frame) with the exception of the Section Overhead Bytes to an "All Ones" pattern. ***Note:*** *This bit-field is ignored if the Transmit STS-1 TOH Processor block is transmitting the LOS pattern.*
3	Force Transmission of LOS Pattern	R/W	**Force Transmission of LOS Pattern:** This READ/WRITE bit-field permits the user to (by software control) force the Transmit STS-1 TOH Processor block to transmit the LOS (Loss of Signal) pattern to the remote terminal equipment, as described below. 0 – Does not configure the Transmit STS-1 TOH Processor block to generate and transmit the LOS pattern. In this case, the Transmit STS-1 TOH Processor block will continue to transmit "normal" traffic to the remote terminal equipment. 1 – Configures the Transmit STS-1 TOH Processor block to transmit the LOS pattern to the remote terminal equipment. In this case, the Transmit STS-1 TOH Processor block will force all bytes (within the "outbound" SONET frame) to an "All Zeros" pattern.
2	Scrambler Enable	R/W	**Scrambler Enable:** This READ/WRITE bit-field permits the user to either enable or disable the Scrambler, within the Transmit STS-1 TOH Processor block circuitry 0 – Disables the Scrambler. 1 – Enables the Scrambler.
1	B2 Byte Error Insert	R/W	**Transmit B2 Byte Error Insert Enable:** This READ/WRITE bit-field permits the user to configure the Transmit STS-1 TOH Processor block to insert errors into the "outbound" B2 bytes, per the contents within the "Transmit STS-1 Transport – Transmit B2 Byte Error Mask Registers" as described below. 0 – Configures the Transmit STS-1 TOH Processor block to NOT insert errors into the B2 bytes, within the outbound STS-3 signal. 1 – Configures the Transmit STS-1 TOH Processor block to insert errors into the B2 bytes (per the contents within the "Transmit B2 Byte

			Error Mask Registers").
0	A1A2 Byte Error Insert	R/W	**Transmit A1A2 Byte Error Insert Enable:** This READ/WRITE bit-field permits the user to configure the Transmit STS-1 TOH Processor block to insert errors into the "outbound" A1 and A2 bytes, per the contents within the "Transmit STS-1 Transport – Transmit A1 Byte Error Mask" and Transmit A2 Byte Error Mask" Registers. 0 – Configures the Transmit STS-1 TOH Processor block to NOT insert errors into the A1 and A2 bytes, within the outbound STS-3 data-stream. 1 – Configures the Transmit STS-1 TOH Processor block to insert errors into the A1 and A2 bytes (per the contents within the "Transmit A1 Byte Error Mask" and "Transmit A2 Byte Error Mask" Registers.

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 0	Transmit_E2_Byte_Value[7:0]	R/W	**Transmit E2 Byte Value:** The exact function of these register bits depends upon whether Bit 7 (Enable All STS-1s) within the "Transmit STS-1 Transport – E2 Byte Control" Register (Address Location= 0xN944) has been set to "0" or "1"; as described below. **If "Enable All STS-1s" is set to "0"** If the appropriate "E2 Insert Method" is selected, then these READ/WRITE bit-fields will permit the user to specify the contents of the E2 byte, within the "outbound" STS-3 signal. More specifically, this value will be loaded into the E2 byte position, within STS-1 # 1 (within the outbound STS-3 signal). If Bit 5 (E2 Insert Method) within the Transmit STS-1 Transport – SONET Transmit Control Register – Byte 1 (Address Location= 0xN902) is set to "1", then the Transmit STS-1 TOH Processor block will load the contents of this register into the "E2" byte-field, within each outbound STS-3 frame. **If "Enable All STS-1s" is set to "1"** In this mode, these register bit permit the user to have direct READ/WRITE access of the "STS-1 E2 Byte shadow" register; that is being pointed at by the "E2 Pointer[1:0]" value. These register bits are ignored if Bit 5 (E2 Byte Insert Method) is set to "0".

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 4	Unused	R/O	
3 – 2	Transmit Section Trace Message Length[1:0]	R/W	**Transmit Section Trace Message Length[1:0]:** These two READ/WRITE bit-fields permit the user to specify the length of the Section Trace message that the Transmit STS-1 TOH Processor block will repeatedly transmit to the remote LTE. The relationship between the contents of these bit-fields and the corresponding Transmit Section Trace Message Length is presented below.
1 – 0	Transmit Section Trace Message Source[1:0]	R/W	**Transmit Section Trace Message Source[1:0]:** These two READ/WRITE bit-fields permit the user to specify the source of the "outbound" Section Trace message that will be transported via the J0 byte channel within the outbound STS-3 data-stream, as depicted below.

Transmit Section Trace Message Length[1:0]	Resulting Section Trace Message Length (in terms of bytes)
00	1 Byte
01	16 Bytes
10 or 11	64 Bytes

Transmit Section Trace Message Source[1:0]	Resulting Source of the Section Trace Message.
00	**Fixed Value:** The Transmit STS-1 TOH Processor block will automatically set the J0 Byte, in each "outbound" STS-3 frame to the value "0x01".
01	**The "Transmit Section Trace Message Buffer".** The Transmit STS-1 TOH Processor block will read out the contents within the Transmit Section Trace Message Buffer, and will transmit this message to the remote LTE. The "Transmit STS-1 TOH Processor block - Transmit Section Trace Message Buffer" Memory is located at Address Location 0x1B00 through 0x1B3F.
10	**From the "Transmit J0 Value[7:0]" Register.** In this setting, the Transmit STS-1 TOH Processor

				block will read out the contents of the "Transmit J0 Byte Value[7:0]" Register (Address Location= 0xN94B), and will insert this value into the J0 byte-position within each outbound STS-3 frame.
			11	**From the "TxTOH" Input pin (pin F8).** In this configuration setting, the Transmit STS-1 TOH Processor block will externally accept the contents of the "Section Trace Message" via the "TxTOH Input Port" and it will transport this message (via the J0 byte-channel) to the remote LTE.

7	F2 Byte Insertion Type	R/W	**F2 Byte Insertion Type:** This READ/WRITE bit-field permits the user to configure the Transmit STS-1 POH Processor block to use either the contents within the "Transmit STS-1 Path – Transmit F2 Byte Value" Register or the TxPOH input pin as the source for the F2 byte, in the outbound STS-3c SPE data-stream, as described below. 0 – Configures the Transmit STS-1 POH Processor block to insert the contents within the "Transmit STS-1 Path – Transmit F2 Byte Value" Register into the F2 byte position within each outbound STS-3c SPE. 1 – Configures the Transmit STS-1 POH Processor block to accept externally supplied data (via the "TPOH" input port) and to insert this data into the F2 byte position within each outbound STS-3c SPE. ***Note:*** *The Address Location of the Transmit STS-1 POH Processor block - Transmit F2 Byte Value Register is 0xN9A3*
6 - 5	REI-P Insertion Type[1:0]	R/W	**REI-P Insertion Type[1:0]:** These two READ/WRITE bit-fields permit the user to configure the Transmit STS-1 POH Processor block to use one of the three following sources for the REI-P bit-fields (e.g., bits 1 through 4, within the G1 byte) within each outbound STS-3c SPE. • From the corresponding Receive STS-3c POH Processor block (e.g., the Transmit STS-1 POH Processor block will set the REI-P bit-fields to the appropriate value, based upon the number of B3 byte errors that the Receive STS-3c POH Processor block detects and flags, within its incoming STS-3c SPE data-stream). • From the "Transmit G1 Byte Value" Register. In this case, the Transmit STS-1 POH Processor block will insert the contents of Bits 7 through 4 within the "Transmit STS-1 POH Processor block – Transmit G1 Byte Value" Register into the REI-P bit-fields within each outbound STS-3c SPE. • From the "TPOH" input pin. In this case, the Transmit STS-1 POH Processor block will accept externally supplied data (via the "TPOH" input port) and it will insert this data into the REI-P bit-fields within each outbound STS-3c SPE. 00/11 – Configures the Transmit STS-1 POH Processor block to set Bits 1 through 4 (in the G1 byte of the outbound SPE) based upon the number of B3 byte errors that the Receive STS-3c POH Processor block detects and flags within the incoming STS-3c data-stream. 01 – Configures the Transmit STS-1 POH Processor block to set Bits 1 through 4 (in the G1 byte of the outbound SPE) based upon the contents within the "Transmit STS-1 POH Processor block - Transmit G1 Byte Value" register. 10 – Configures the Transmit STS-1 POH Processor block to accept externally supplied data (via the TPOH input port) and to insert this data into the REI-P bit-positions within each outbound STS-3c SPE. ***Note:*** *The address location of the Transmit STS-1 POH Processor block -*

			Transmit G1 Byte Value Register is 0xN99F
4 - 3	RDI-P Insertion Type[1:0]	R/W	**RDI-P Insertion Type[1:0]:** These two READ/WRITE bit-fields permit the user to configure the Transmit STS-1 POH Processor block to use one of the three following sources for the RDI-P bit-fields (e.g., bits 5 through 7, within the G1 byte) within each outbound STS-3c SPE. • From the corresponding Receive STS-3c POH Processor block (e g., the Transmit STS-1 POH Processor block will set the RDI-P bit-fields to the appropriate value, based upon which defect conditions are being declared by the Receive STS-3c POH Processor block, within its incoming STS-3c SPE data-stream). • From the "Transmit G1 Byte Value" Register. In this case, the Transmit STS-1 POH Processor blolck will insert the content of bits 2 through 0 within the "Transmit STS-1 POH Processor block – Transmit G1 Byte Value" Register into the RDI-P bit-fields within each outbound STS-3c SPE. • From the "TPOH" input pin. In this case, the Transmit STS-1 POH Processor block will accept externally supplied data (via the "TPOH" input port) and it will insert this data into the RDI-P bit-fields within each outbound STS-3c SPE. 00/11 – Configures the Transmit STS-1 POH Processor block to set Bits 5 through 7 (in the G1 byte of the outbound SPE) based upon the defects conditions that the Receive STS-3c POH Processor block is currently declaring within the incoming STS-3c data-stream. 01 – Configures the Transmit STS-1 POH Processor block to set Bits 5 through 7 (in the G1 byte of the outbound SPE) based upon the contents within the "Transmit STS-1 POH Processor block - Transmit G1 Byte Value" register. 10 – Configures the Transmit STS-1 POH Processor block to accept externally supplied data (via the TPOH input port) and to insert this data into the RDI-P bit-positions within each outbound STS-3c SPE. ***Note:*** *The address location of the Transmit STS-1 POH Processor block - Transmit G1 Byte Value Register is 0xN99F*
2	C2 Byte Insertion Type	R/W	**C2 Byte Insertion Type:** This READ/WRITE bit-field permits the user to configure the Transmit STS-1 POH Processor block to use either the contents within the "Transmit STS-1 Path – Transmit C2 Byte Value" Register or the TPOH input pin as the source for the C2 byte, in the outbound STS-3c SPE data-stream, as described below. 0 – Configures the Transmit STS-1 POH Processor block to insert the contents within the "Transmit STS-1 Path – Transmit C2 Byte Value" Register into the C2 byte-position within each outbound STS-3c SPE. 1 – Configures the Transmit STS-1 POH Processor block to accept externally supplied data (via the "TPOH" input port) and to insert this data into the C2 byte position within each outbound STS-3c SPE. ***Note:*** *The address location of the Transmit STS-1 POH Processor block - Transmit C2 Byte Value Register is 0xN99B*
1	Unused	R/O	
0	Transmit AIS-P Enable	R/W	**Transmit AIS-P Enable:** This READ/WRITE bit-field permits the user to configure the Transmit STS-1 POH Processor block to (via software control) transmit the AIS-P indicator to the remote PTE. If this feature is enabled, then the Transmit STS-1 POH Processor block will automatically set the H1, H2, H3 and all the "outbound" STS-3c SPE bytes to an "All Ones" pattern, prior to routing this data to the Transmit STS-3 TOH

			Processor block. 0 – Configures the Transmit STS-1 POH Processor block to NOT transmit the AIS-P indicator to the remote PTE. In this case, the Transmit STS-1 POH Processor block will transmit “normal” traffic to the remote PTE. 1 – Configures the Transmit STS-1 POH Processor block to transmit the AIS-P indicator to the remote PTE.

Table 563: Transmit STS-1 Path – Transmitter J1 Byte Value Register (Address Location= 0xN993; where N ranges in value from 5 to 7)

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 0	Transmit B3 Byte Error_Mask[7:0]	R/W	**Transmit B3 Byte Error Mask[7:0]:** This READ/WRITE bit-field permits the user to insert errors into the B3 byte within each "outbound" STS-3c SPE, prior to transmission to the Transmit STS-3 TOH Processor block. The Transmit STS-1 POH Processor block will perform an XOR operation with the contents of this register, and its "locally-computed" B3 byte value. The results of this operation will be written back into the B3 byte-position within each "outbound" STS-3c SPE. If the user sets a particular bit-field, within this register, to "1", then that corresponding bit, within the "outbound" B3 byte will be in error. ***Note:*** *For normal operation, the user should set this register to 0x00.*

Table 565: Transmit STS-1 Path – Transmit C2 Byte Value Register (Address Location= 0xN99B; where N ranges in value from 5 to 7)

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 0	Transmit Z5 Byte Value[7:0]	R/W	**Transmit Z5 Byte Value:** These READ/WRITE bit-fields permit the user to have software control over the value of the Z5 byte, within each outbound STS-3c SPE. If the user configures the Transmit STS-1 POH Processor block to this register as the source of the Z5 byte, then it will automatically write the contents of this register into the Z5 byte location, within each “outbound” STS-3c SPE. This feature is enabled whenever the user writes a “0” into Bit 3 (Z5 Insertion Type) within the “Transmit STS-1 Path – SONET Control Register – Byte 0” register. ***Note:*** *The Address Location of the Transmit STS-1 Path – SONET Control Register – Byte 0” register is 0xN982*

Table 572: Transmit STS-1 Path – Transmit Path Control Register (Address Location= 0xN9B7; where N ranges in value from 5 to 7)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused		Pointer Force	Check Stuff	Insert Negative Stuff	Insert Positive Stuff	Insert Continuous NDF Events	Insert Single NDF Event
R/O	R/O	R/W	R/W	W	W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 6	Unused	R/O	
5	Pointer Force	R/W	**Pointer Force:** This READ/WRITE bit-field permits the user to load the values contained within the "Transmit STS-1 POH Arbitrary H1 Pointer Byte" and "Transmit STS-1 POH Arbitrary H2 Pointer Byte" registers into the H1 and H2 bytes (within the outbound STS-3c data stream). ***Note:*** *The actual location of the SPE will NOT be adjusted, per the value of H1 and H2 bytes. Hence, this feature should cause the remote terminal to declare an "Invalid Pointer" condition.* 0 – Configures the Transmit STS-1 POH and Transmit STS-3 TOH Processor blocks to Transmit STS-1/STS-3 data with normal and correct H1 and H2 bytes. 1 – Configures the Transmit STS-1 POH and Transmit STS-3 TOH Processor blocks to overwrite the values of the H1 and H2 bytes (in the outbound STS-3c/STS-3 data-stream) with the values in the "Transmit STS-1 POH Arbitrary H1 and H2 Pointer Byte" registers. ***Note:*** *1. The Address Location of the Transmit STS-1 Arbitrary H1 Pointer Byte register is 0xN9BF* *2. The Address Location of the Transmit STS-1 Arbitrary H2 Pointer Byte register is 0xN9C3*
4	Check Stuff	R/W	**Check Stuff Monitoring:** This READ/WRITE bit-field permits the user to configure the Transmit STS-1 POH and Transmit STS-3 TOH Processor blocks to only execute a "Positive", "Negative" or "NDF" event (via the "Insert Positive Stuff", "Insert Negative Stuff", "Insert Continuous or Single NDF" options, via software command) if no pointer adjustment (NDF or otherwise) has occurred during the last 3 SONET frame periods. 0 – Disables this feature. In this mode, the Transmit STS-1 POH and Transmit STS-3 TOH Processor blocks will execute a "software-commanded" pointer adjustment event, independent of whether a pointer adjustment event has occurred in the last 3 SONET frame periods. 1 – Enables this feature. In this mode, the Transmit STS-1 POH and Transmit STS-3 TOH Processor blocks will ONLY execute a "software-commanded" pointer adjustment event, if no pointer adjustment event has occurred during the last 3 SONET frame periods.

3	Insert Negative Stuff	R/W	**Insert Negative Stuff:** This READ/WRITE bit-field permits the user to configure the Transmit STS-1 POH and Transmit STS-3 TOH Processor blocks to insert a negative-stuff into the outbound STS-3c/STS-3 data stream. This command, in-turn will cause a "Pointer Decrementing" event at the remote terminal. Writing a "0" to "1" transition into this bit-field causes the following to happen. • A negative-stuff will occur (e.g., a single payload byte will be inserted into the H3 byte position within the outbound STS-1/STS-3 data stream). • The "D" bits, within the H1 and H2 bytes will be inverted (to denote a "Decrementing" Pointer Adjustment event). • The contents of the H1 and H2 bytes will be decremented by "1", and will be used as the new pointer from this point on. ***Note:*** *Once the user writes a "1" into this bit-field, the XRT94L33 will automatically clear this bit-field. Hence, there is no need to subsequently reset this bit-field to "0".*
2	Insert Positive Stuff	R/W	**Insert Positive Stuff:** This READ/WRITE bit-field permits the user to configure the Transmit STS-1 POH and Transmit STS-3 TOH Processor blocks to insert a positive-stuff into the outbound STS-3c/STS-3 data stream. This command, in-turn will cause a "Pointer Incrementing" event at the remote terminal. Writing a "0" to "1" transition into this bit-field causes the following to happen. • A positive-stuff will occur (e.g., a single stuff-byte will be inserted into the STS-3c/STS-3 data-stream, immediately after the H3 byte position within the outbound STS-3c/STS-3 data stream). • The "I" bits, within the H1 and H2 bytes will be inverted (to denote a "Incrementing" Pointer Adjustment event). • The contents of the H1 and H2 bytes will be incremented by "1", and will be used as the new pointer from this point on. ***Note:*** *Once the user writes a "1" into this bit-field, the XRT94L33 will automatically clear this bit-field. Hence, there is no need to subsequently reset this bit-field to "0".*
1	Insert Continuous NDF Events	R/W	**Insert Continuous NDF Events:** This READ/WRITE bit-field permits the user configure the Transmit STS-1 POH and Transmit STS-3 TOH Processor blocks to continuously insert a New Data Flag (NDF) pointer adjustment into the outbound STS-3c/STS-3 data stream. ***Note:*** *As the Transmit STS-1 POH and Transmit STS-3 TOH Processor blocks insert the NDF event into the STS-1/STS-3 data stream, it will proceed to load in the contents of the "Transmit STS-1 POH Arbitrary H1 Pointer" and "Transmit STS-1 POH Arbitrary H2 Pointer" registers into the H1 and H2 bytes (within the outbound STS-3c/STS-3 data stream).* 0 – Configures the "Transmit STS-1 TOH and Transmit STS-3 POH Processor" blocks to not continuously insert NDF events into the "outbound" STS-3c/STS-3 data stream. 1- Configures the "Transmit STS-1 TOH and Transmit STS-3 POH Processor" blocks to continuously insert NDF events into the "outbound" STS-3c/STS-3 data stream.
0	Insert Single NDF Event	R/W	**Insert Single NDF Event:** This READ/WRITE bit-field permits the user to configure the Transmit STS-1 POH and Transmit STS-3 TOH Processor blocks to insert a New Data Flag

			(NDF) pointer adjustment into the outbound STS-3c/STS-3 data stream. Writing a "0" to "1" transition into this bit-field causes the following to happen. • The "N" bits, within the H1 byte will set to the value "1001" • The ten pointer-value bits (within the H1 and H2 bytes) will be set to new pointer value per the contents within the "Transmit STS-1 POH – Arbitrary H1 Pointer" and "Transmit STS-1 POH Arbitrary H2 Pointer" registers (Address Location= 0xN9BF and 0xN9C3). • Afterwards, the "N" bits will resume their normal value of "0110"; and this new pointer value will be used as the new pointer from this point on. ***Note:*** *1. Once the user writes a "1" into this bit-field, the XRT94L33 will automatically clear this bit-field. Hence, there is no need to subsequently reset this bit-field to "0".* *2. The Address Location of the Transmit STS-1 Arbitrary H1 Pointer Byte register is 0xN9BF* *3. The Address Location of the Transmit STS-1 Arbitrary H2 Pointer Byte register is 0xN9C3*

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 5	TIM-P RDI-P Code[2:0]	R/W	**TIM-P (Path – Trace Identification Mismatch) Defect – RDI-P Code:** These three READ/WRITE bit-fields permit the user to specify the value that the Transmit STS-1 POH Processor block will transmit, within the RDI-P bit-fields of the G1 byte (within each "outbound" STS-3c SPE), whenever (and for the duration that) the Receive STS-3c POH Processor block detects and declares the TIM-P defect condition. ***Note:*** *In order to enable this feature, the user must set Bit 4 (Transmit RDI-P upon TIM-P) within this register to "1".*
4	Transmit RDI-P upon TIM-P	R/W	**Transmit the RDI-P Indicator upon declaration of the TIM-P defect condition:** This READ/WRITE bit-field permits the user to configure the Transmit STS-1 POH Processor block to automatically transmit the RDI-P Code (as configured in Bits 7 through 5 – within this register) towards the remote PTE whenever (and for the duration that) the Receive STS-3c POH Processor block declares the TIM-P defect condition. 0 – Configures the Transmit STS-1 POH Processor block to NOT automatically transmit the RDI-P indicator whenever (and for the duration that) the Receive STS-3c POH Processor block declares the TIM-P defect condition. 1 – Configures the Transmit STS-1 POH Processor block to automatically transmit the RDI-P indicator whenever (and for the duration that) the Receive STS-3c POH Processor blolck declares the TIM-P defect condition. **NOTE:** The Transmit STS-1 POH Processor block will transmit the RDI-P indicator (in response to the Receive STS-3c POH Processor block declaring the TIM-P defect condition) by setting the RDI-P bit-fields (within each outbound STS-3c SPE) to the contents within the "TIM-P RDI-P Code[2:0]" bit-fields within this register.
3 - 1	UNEQ-P RDI-P Code[2:0]	R/W	**UNEQ-P (Path – Unequipped) Defect – RDI-P Code:** These three READ/WRITE bit-fields permit the user to specify the value that the Transmit STS-1 POH Processor block will transmit, within the RDI-P bit-fields of the G1 byte (within each "outbound" STS-3c SPE), whenever (and for the duration that) the Receive STS-3c POH Processor block detects and declares the UNEQ-P defect condition. ***Note:*** *In order to enable this feature, the user must set Bit 0 (Transmit RDI-P upon UNEQ-P) within this register to "1".*
0	Transmit RDI-P upon UNEQ-P	R/W	**Transmit the RDI-P indicator upon declaration of the UNEQ-P defect condition:** This READ/WRITE bit-field permits the user to configure the Transmit

			STS-1 POH Processor block to automatically transmit the RDI-P Code (as configured in Bits 7 through 5 – within this register) towards the remote PTE whenever (and for the duration that) the Receive STS-3c POH Processor block declares the UNEQ-P defect condition. 0 – Configures the Transmit STS-1 POH Processor block to NOT automatically transmit the RDI-P indicator whenever (and for the duration that) the Receive STS-3c POH Processor block declares the UNEQ-P defect condition. 1 – Configures the Transmit STS-1 POH Processor block to automatically transmit the RDI-P indicator whenever (and for the duration that) the Receive STS-3c POH Processor block declares the UNEQ-P defect condition. **NOTE:** The Transmit STS-1 POH Processor block will transmit the RDI-P indicator (in response to the Receive STS-3c POH Processor block declaring the UNEQ-P defect condition) by setting the RDI-P bit-fields (within each outbound STS-3c SPE) to the contents within the "UNEQ-P RDI-P Code[2:0]" bit-fields within this register.

Table 580: Transmit STS-1 Path – RDI-P Control Register – Byte 1 (Address Location= 0xN9CB; where N ranges in value from 5 to 7)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
1	1	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 - 5	LOP-P RDI-P Code[2:0]	R/W	**LOP-P (Path – Loss of Pointer) Defect – RDI-P Code:** These three READ/WRITE bit-fields permit the user to specify the value that the Transmit STS-1 POH Processor block will transmit, within the RDI-P bit-fields of the G1 byte (within each "outbound" STS-3c SPE), whenever (and for the duration that) the Receive STS-3c POH Processor block detects and declares the LOP-P defect condition. ***Note:*** *In order to enable this feature, the user must set Bit 4 (Transmit RDI-P upon LOP-P) within this register to "1".*
4	Transmit RDI-P upon LOP-P	R/W	**Transmit the RDI-P Indicator upon declaration of the LOP-P defect condition:** This READ/WRITE bit-field permits the user to configure the Transmit STS-1 POH Processor block to automatically transmit the RDI-P Code (as configured in Bits 7 through 5 – within this register) towards the remote PTE whenever (and for the duration that) the Receive STS-3c POH Processor block declares the LOP-P defect condition. 0 – Configures the Transmit STS-1 POH Processor block to NOT automatically transmit the RDI-P indicator whenever (and for the duration that) the Receive STS-3c POH Processor block declares the LOP-P defect condition. 1 – Configures the Transmit STS-1 POH Processor block to automatically transmit the RDI-P indicator whenever (and for the duration that) the Receive STS-3c POH Processor block declares the LOP-P defect condition. **NOTE:** The Transmit STS-1 POH Processor block will transmit the RDI-P indicator (in response to the Receive STS-3c POH Processor block declaring the LOP-P defect condition) by setting the RDI-P bit-fields (within each outbound STS-3c SPE) to the contents within the "LOP-P RDI-P Code[2:0]" bit-fields within this register.
3 - 1	AIS-P RDI-P Code[2:0]	R/W	**AIS-P (Path – AIS) Defect – RDI-P Code:** These three READ/WRITE bit-fields permit the user to specify the value that the Transmit STS-1 POH Processor block will transmit, within the RDI-P bit-fields of the G1 byte (within the "outbound" STS-3c SPE), whenever (and for the duration that) the Receive STS-3c POH Processor block detects and declares the AIS-P defect condition. ***Note:*** *In order to enable this feature, the user must set Bit 0 (Transmit RDI-P upon AIS-P) within this register to "1".*
0	Transmit RDI-P upon AIS-P	R/W	**Transmit the RDI-P Indicator upon declaration of the AIS-P defect condition:** This READ/WRITE bit-field permits the user to configure the Transmit

			STS-1 POH Processor block to automatically transmit the RDI-P Code (as configured in Bits 7 through 5 – within this register) towards the remote PTE whenever (and for the duration that) the Receive STS-3c POH Processor block declares the AIS-P defect condition. 0 – Configures the Transmit STS-1 POH Processor block to NOT automatically transmit the RDI-P indicator whenever (and for the duration that) the Receive STS-3c POH Processor block declares the AIS-P defect condition. 1 – Configures the Transmit STS-1 POH Processor block to automatically transmit the RDI-P indicator whenever (and for the duration that) the Receive STS-3c POH Processor block declares the AIS-P defect condition. **NOTE:** The Transmit STS-1 POH Processor block will transmit the RDI-P indicator (in response to the Receive STS-3c POH Processor block declaring the AIS-P defect condition) by setting the RDI-P bit-field (within each outbound STS-3c SPE) to the contents within the "AIS-P RDI-P Code[2:0]" bit-fields within this register.

Table 581: Transmit STS-1 Path – Serial Port Control Register (Address Location= 0xN9CF; where N ranges in value from 5 to 7)

BIT 7	BIT 6	BIT 5	BIT 4	BIT 3	BIT 2	BIT 1	BIT 0
Unused				TxPOH Clock Speed [3:0]			
R/O	R/O	R/O	R/O	R/W	R/W	R/W	R/W
0	0	0	0	0	0	0	0

BIT NUMBER	NAME	TYPE	DESCRIPTION
7 – 4	Unused	R/O	
3 – 0	TxPOH Clock Speed [3:0]	R/W	**TxPOHClk Output Clock Signal Speed:** These READ/WRITE bit-fields permit the user to specify the frequency of the "TxPOHClk output clock signal. The formula that relates the contents of these register bits to the "TxPOHClk" frequency is presented below. FREQ = 19.44/[2 * (TxPOH_CLOCK_SPEED + 1) ***Note:*** *For STS-3/STM-1 applications, the frequency of the RxPOHClk output signal must be in the range of 0.304MHz to 9.72MHz*

NOTES:

REV. 2.0.0 - Added bit descriptions for bits 7, 6, 5 & 4in register 0x011B.
