

## Features

- Adjustable output voltage or 1.5V, 1.8V, 2.6V, 3.3 V, 5.0V output voltage
- 1.0 A output current
- Low dropout voltage, typ. 1 V
- Short circuit protection
- Overtemperature protection
- Wide operating range up to 40 V
- Wide temperature range of  $T_j = -40$  to  $150$  °C
- Suitable for use in automotive electronics
- Green Product (RoHS compliant)
- AEC Qualified

## Functional Description

The TLE 4284 is a monolithic integrated NPN type voltage regulator that can supply loads up to 1.0 A. The chip is housed in a surface mounted PG-TO252-3-11 package (DPAK). It is designed to supply microprocessor systems or other loads under the severe conditions of automotive applications and therefore it is equipped with additional protection against overload, short circuit and overtemperature.

An input voltage  $V_I$  in the range of  $(V_Q + V_{DR}) < V_I < 40$  V is regulated to  $V_Q$ . The dropout voltage  $V_{DR}$  ranges from 1.1 V to 1.4 V depending on the load current level.

The device operates in the temperature range of  $T_j = -40$  to  $150$  °C.

1) Device is usable within given range without destruction, but the accuracy of the output voltage can only be guaranteed in the range specified in the line above.

2) Measured at constant junction temperature

3) Dropout voltage measured when the output voltage has dropped 100 mV from the nominal value.

4) Not subject to production test - specified by design.

Application Information

Figure 4 Typical application circuit of fixed output voltage versions and adjustable output voltage version

Typical Performance Characteristics

Current Consumption  $I_q$  versus Junction Temperature  $T_j$

Current Consumption  $I_q$  versus Input Voltage  $V_i$

Current Consumption  $I_q$  versus Output Current  $I_Q$

Adjust Current  $I_{ADJ}$  and Reference Voltage  $V_{Ref}$  vs Junction Temperature  $T_j$

**Output Voltage  $V_Q$  versus Junction Temperature  $T_j$**

**Output Current Limit  $I_{Qmax}$  versus Junction Temperature  $T_j$**

**Dropout Voltage  $V_{DR}$  versus Junction Temperature  $T_j$**

**Safe Operation Area (SOA): Output Current  $I_Q$  vs. Input Voltage  $V_I$**

### Output Voltage $V_Q$ versus Input Voltage $V_I$

### Power Supply Ripple Rejection versus Frequency

### Stability Region: Equivalent Serial Resistor ESR versus Output Current $I_Q$

### Power Supply Ripple Rejection versus Frequency

**Load Regulation: Delta Output Voltage  $dV_Q$  versus delta Output Current  $dI_Q$**

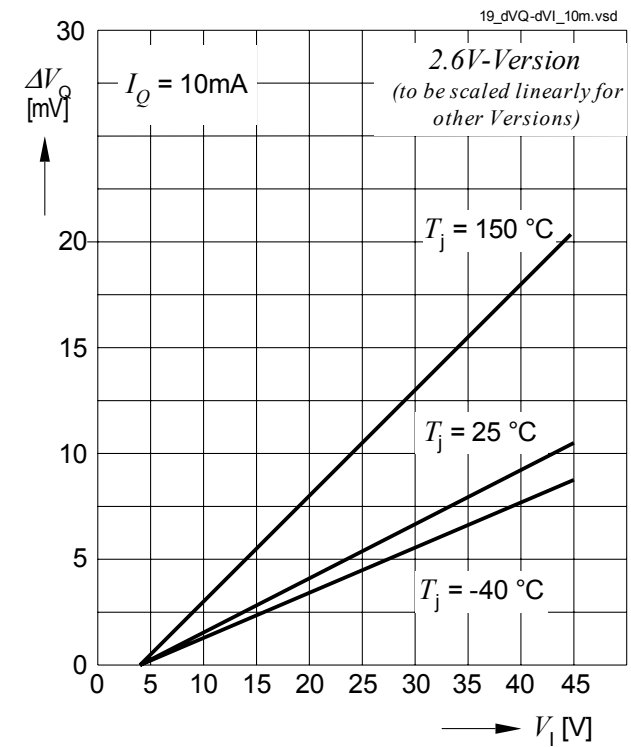

**Load Regulation: Delta Output Voltage  $dV_Q$  versus delta Output Current  $dI_Q$**

**Load Regulation: Delta Output Voltage  $dV_Q$  versus delta Output Current  $dI_Q$**

**Line Regulation: Delta Output Voltage  $dV_Q$  versus delta Input Voltage  $dV_I$**

**Line Regulation: Delta Output Voltage  $\Delta V_Q$  versus delta Input Voltage  $\Delta V_I$**

## Application Hints

### Adjustable Version

At the fixed voltage TLE 4284 devices, the output voltage is divided internally and compared to an internal reference of 1.25 V typical. The regulation loop controls the output voltage to achieve the output voltage of 5 V, 3.3 V, 2.6 V, 1.8V or 1.5V. The variable version compares the voltage difference between the adjust pin ADJ and the output pin Q to the internal reference of typically 1.25 V. The output voltage is adjusted by an external voltage divider between Q, ADJ and GND and calculates:

$$V_Q = V_{REF} \times \left( 1 + \frac{R_2}{R_1} \right) + I_{ADJ} \times R_2$$

For the variable regulator TLE 4284 DV, a minimum load current of 5 mA is necessary in order to keep the output voltage regulated. If the application does not assure this minimum load requirement, the output voltage divider should be dimensioned sufficiently low-ohmic:  $R_1 \leq 240 \Omega$ .

For the variable voltage type an additional decoupling a capacitor  $C_{ADJ}$  at the adjust pin improves the ripple rejection ratios. Placing  $C_{ADJ}$  requires an increased output capacitance of  $C_Q \geq 22 \mu\text{F}$ .

### Output

The output current limitation is reduced as a function of the input voltage for high input voltages above 25 V.

The TLE 4284 requires a 10  $\mu\text{F}$  output capacitor with  $0.1 \Omega \leq \text{ESR} \leq 10 \Omega$  for the stability of the regulation loop.

At the input of the regulator a capacitor is necessary for compensation of line influences. A serial diode should be used to eliminate negative voltages from the input. As a minimum, a 100 nF ceramic input capacitor should be used. If the regulator is used in an environment with long input lines, an input capacitance of 10  $\mu\text{F}$  is recommended.

Package Outlines

Figure 5 Dimensions PG-T0252-3-11

Green Product (RoHS compliant)

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (i.e Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).
