### CHOISE OF THE BOARD

The user must choose the board according to the working conditions of the component (power, room temperature). Maximum working temperature must not exceed 155 °C. The dissipated power is simply calculated by the following ratio:

$$P = \frac{\Delta T}{[R_{TH(j-c)}] + [R_{TH(c-a)}]} \quad (1)$$

P: Expressed in W

$\Delta T$ : Difference between maximum working temperature and room temperature

$R_{TH(j-c)}$ : Thermal resistance value measured between resistive layer and outer side of the resistor. It is the thermal resistance of the component: 4.28 °C/W.

$R_{TH(c-a)}$ : Thermal resistance value measured between outer side of the resistor and room temperature. It is the thermal resistance of the solder layer (according the quality of the soldering) and the thermal resistance of the board.

Example:

$R_{TH(c-a)}$  for D2TO35 power rating 3.5 W at ambient temperature + 25 °C.

Thermal resistance  $R_{TH(j-c)}$ : 4.28 °C/W

Considering equation (1) we have:

$$\Delta T = 175 \text{ °C} - 25 \text{ °C} = 150 \text{ °C}$$

$$R_{TH(j-c)} + R_{TH(c-a)} = \Delta T / P = 150 / 3.5 = 42.8 \text{ °C/W}$$

$$R_{TH(c-a)} = 42.8 \text{ °C/W} - 4.28 \text{ °C/W} = 38.52 \text{ °C/W}$$

### ACCIDENTAL OVERLOAD

In any case the applied voltage must be lower than the maximum overload voltage of 375 V. The values indicated on the graph below are applicable to resistors in air or mounted onto a board.

### ENERGY CURVE

#### Single Pulse:

These informations are for a single pulse on a cold resistor at 25 °C (not already used for a dissipation) and for pulses of 100 ms maximum duration.

The formula used to calculate  $E$  is:

$$E = P \times t = \frac{U^2}{R} \times t$$

with:

$E$  (J): Pulse energy

$P$  (W): Pulse power

$t$  (s): Pulse duration

$U$  (V): Pulse voltage

$R$  ( $\Omega$ ): Resistor

The energy calculated must be less than that allowed by the graph.

**Repetitive or Superimposed Pulses:**

The following formula is used to calculate the “equivalent” energy of a repetitive pulse or the “equivalent energy” of a pulse on a resistor that is already dissipating power.

$$E_c = E \times \left(1 + \frac{P_a}{P_r}\right)$$

with:

- $E_c$  (J): Equivalent pulse energy
- $E$  (J): Known pulse energy
- $P_r$ : Resistor power rating
- $P_a$ : Mean power being dissipated

The energy calculated must be less than that allowed by the graph and the average power dissipated ( $P_a$ ) must not exceed the continuous power of resistor.
