IDT74CBTLV3383

### FEATURES:

- $5\Omega$  A/B bi-directional bus switch
- Isolation under power-off conditions
- Over-voltage tolerant
- Latch-up performance exceeds 100mA
- $V_{CC} = 2.3V - 3.6V$ , Normal Range

  > 200V using machine model ( $C = 200pF$ ,  $R = 0$ )
- Available in SSOP, QSOP and TSSOP packages

### DESCRIPTION:

The CBTLV3383 provides ten bits of high-speed bus switching or exchanging with low on-switch resistance of the switch allowing connections to be made with minimal propagation delay.

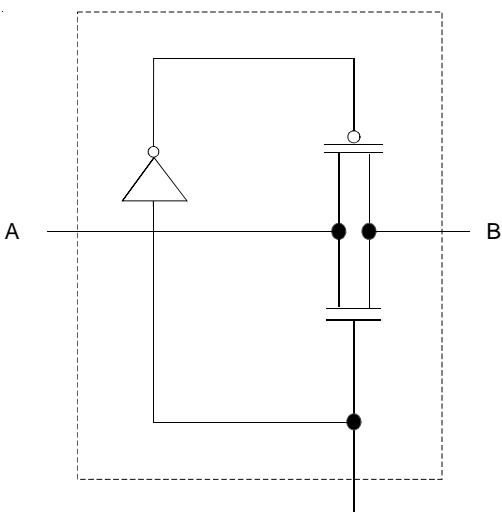

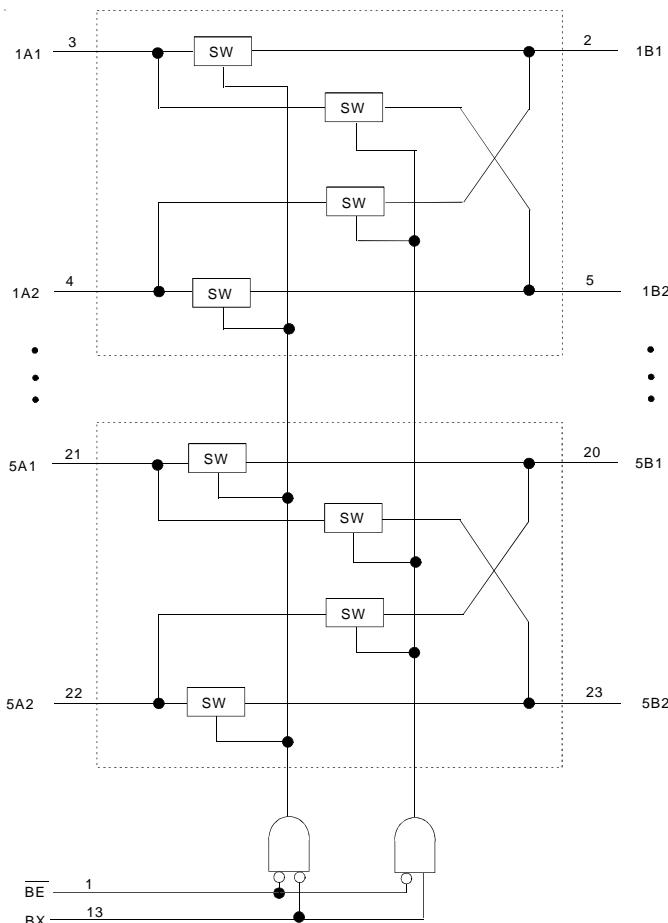

The device operates as a 10-bit bus switch or a 5-bit bus exchanger, which provides swapping of the A and B pairs of signals. The bus-exchange function is selected when BX is high and  $\overline{BE}$  is low.

### APPLICATIONS:

- 3.3V High Speed Bus Switching and Bus Isolation
- Crossbar Switching

### NOTES:

1. Typical values are at  $V_{CC} = 3.3\text{V}$ ,  $+25^\circ\text{C}$  ambient.
2. The increase in supply current is attributable to each current that is at the specified voltage level rather than  $V_{CC}$  or GND.
3. This is measured by the voltage drop between the A and B terminals at the indicated current through the switch. On-state resistance is determined by the lower of the voltages of the two (A or B) terminals.

## SWITCHING CHARACTERISTICS

$t_{DIS}$	Output Disable Time $\overline{BE}$ to A or B	1	—	6	1	—	6	ns

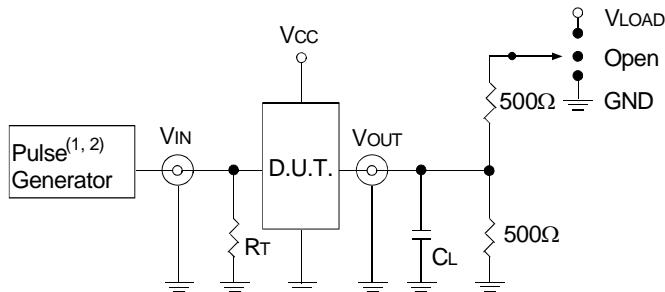

### NOTE:

1. The propagation delay is the calculated RC time constant of the typical on-state resistance of the switch and the specified load capacitance driven by an ideal voltage source (zero output impedance).
