

# 54SX Family FPGAs

## Leading Edge Performance

- 320 MHz Internal Performance
- 3.7 ns Clock-to-Out (Pin-to-Pin)
- 0.1 ns Input Set-Up
- 0.25 ns Clock Skew

## Specifications

- 8,000 to 32,000 Available Logic Gates
- Up to 246 User-Programmable I/O
- 1,980 Flip-Flops
- 0.35 $\mu$  CMOS

## Features

- 66 MHz PCI
- CPLD and FPGA Integration
- Single Chip Solution

- 100% Resource Utilization with 100% Pin Locking
- 3.3V Operation with 5.0V Input Tolerance
- Very Low Power Consumption
- Deterministic, User-Controllable Timing
- Unique, In-System Diagnostic and Debug capability with Silicon Explorer
- JTAG Boundary Scan Testing in Compliance with IEEE Standard 1149.1
- Actel Designer Series Design Tools, Supported by Cadence, Exemplar, IST, Mentor Graphics, Model Tech, Synopsys, Synplicity, and Viewlogic Design Entry and Simulation Tools
- Secure Programming Technology Prevents Reverse Engineering and Design Theft

## SX Product Profile

## General Description

### The New SX Family of FPGAs

Actel's SX Family of FPGAs features a revolutionary new sea-of-modules architecture that delivers next-generation device performance and integration levels not currently achieved by any other FPGA architecture. SX devices greatly simplify design time, enable dramatic reductions in design costs and power consumption, and further speed time-to-market for performance-intensive applications.

### Fast and Flexible New Architecture

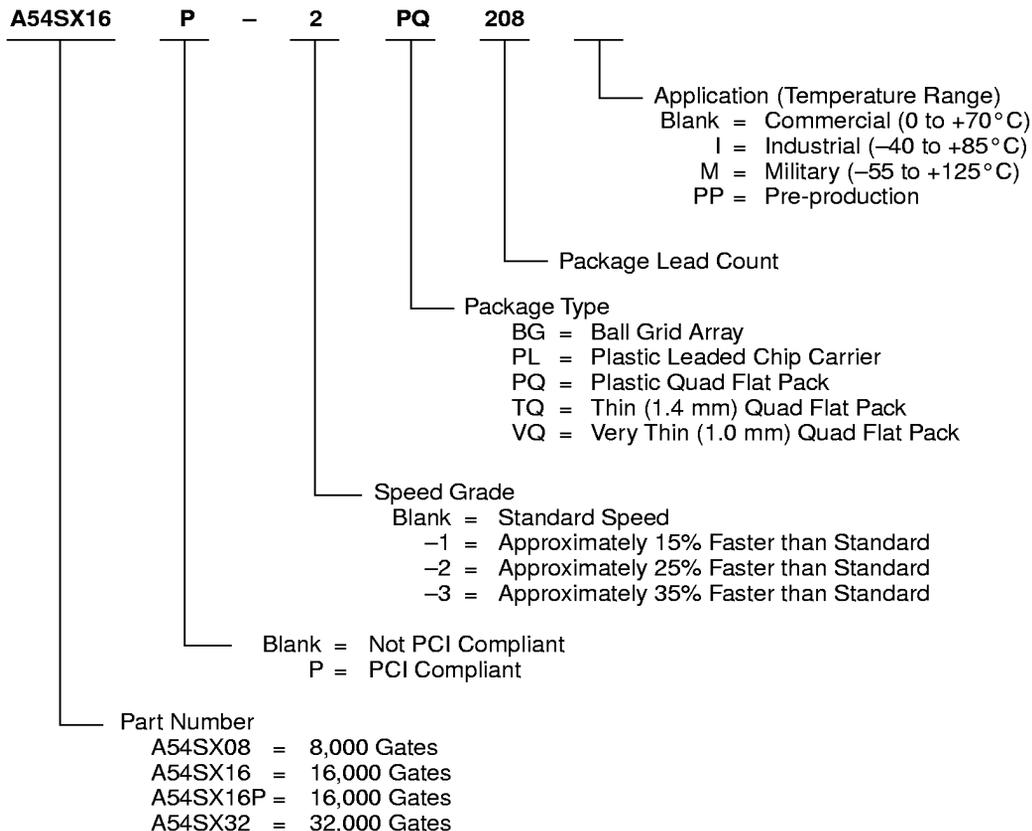

Actel's SX architecture features two types of logic modules, the combinatorial cell (C-cell) and the register cell (R-cell), each optimized for fast and efficient mapping of synthesized logic functions. Optimal use of the silicon is made by locating the routing and interconnect resources in the metal layers above the logic modules, enabling the entire floor of the device to be spanned with an uninterrupted grid of fine-grained, synthesis-friendly logic modules (or "sea-of-modules") which reduces the distance signals have to travel between logic modules.

To minimize signal propagation delay, SX devices employ both local and general routing resources. The high-speed local

routing resources (DirectConnect and FastConnect) enable very fast local signal propagation that is optimal for fast counters, state machines, and datapath logic. The general system of segmented routing tracks allows any logic module in the array to be connected to any other logic or I/O module. Within this system, propagation delay is minimized by limiting the number of antifuse interconnect elements to five (typically 90% of connections use only three antifuses). The unique local and general routing structure featured in SX devices gives fast and predictable performance, allows 100% pin-locking with full logic utilization, enables concurrent PCB development, reduces design time, and allows designers to achieve performance goals with a minimum of effort.

Further complementing the SX's flexible routing structure, a hard-wired, constantly-loaded clock network has been tuned to provide fast clock propagation with minimal clock skew. Additionally, the high performance of the internal logic has eliminated the need to embed latches or flip-flops in the I/O cells to achieve fast clock-to-out or fast input set-up times. SX devices have easy-to-use I/O cells which do not require HDL instantiation, facilitating design re-use and reducing design and debugging time.

## Pin Description

### CLKA Clock A (Input)

TTL clock input for clock distribution networks. The clock input is buffered prior to clocking the R-cells. If not used, this pin must be set LOW or HIGH on the board. It must not be left floating.

### CLKB Clock B (Input)

TTL clock input for clock distribution networks. The clock input is buffered prior to clocking the R-cells. If not used, this pin must be set LOW or HIGH on the board. It must not be left floating.

### TCK Test Clock (Input)

Test clock input for diagnostic probe and device programming. In flexible mode (refer to the JTAG pins functionality table), TCK becomes active when the TMS pin is set LOW. This pin functions as an I/O when the JTAG state machine reaches the "logic reset" state.

### GND Ground

LOW supply voltage.

### HCLK Dedicated (Hard-wired) Array Clock (Input)

TTL clock input for sequential modules. This input is directly wired to each R-cell and offers clock speeds independent of the number of R-cells being driven. If not used, this pin must be set LOW or HIGH on the board. It must not be left floating.

### I/O Input/Output (Input, Output)

The I/O pin functions as an input, output, three-state, or bi-directional buffer. Input and output levels are compatible with standard TTL and CMOS specifications. Unused I/O pins are tri-stated by the Designer Series software.

### TMS Test Mode Select (Input)

The TMS pin controls the use of JTAG pins (TCK, TDI, TDO). In flexible mode (refer to the JTAG pins functionality table), when the TMS pin is set LOW, the TCK, TDI, and TDO pins are JTAG pins. Once the JTAG pins are in JTAG mode they will remain in JTAG mode until the internal JTAG state machine reaches the "logic reset" state. At this point the JTAG pins will be released and will function as regular I/O pins. The "logic reset" state is reached 5 TCK cycles after the TMS pin is

set HIGH. In dedicated JTAG mode, TMS functions as specified in the IEEE 499.1 JTAG Specifications. JTAG operation is further described on page 10.

### NC No Connection

This pin is not connected to circuitry within the device.

### PRA ActionProbe A (Output)

The ActionProbe A pin is used to output data from any user-defined design node within the device. This independent diagnostic pin can be used in conjunction with the ActionProbe B pin to allow real-time diagnostic output of any signal path within the device. The ActionProbe A pin can be used as a user-defined I/O when debugging has been completed.

### PRB ActionProbe B (Output)

The ActionProbe B pin is used to output data from any node within the device. This diagnostic pin can be used in conjunction with the ActionProbe A pin to allow real-time diagnostic output of any signal path within the device. The ActionProbe B pin can be used as a user-defined I/O when debugging has been completed.

### TDI Test Data Input (Input)

Serial input for JTAG and diagnostic probe. In flexible mode, (refer to the JTAG pins functionality table), TDI is active when the TMS pin is set LOW. This pin functions as an I/O when the JTAG state machine reaches the "logic reset" state.

### TDO Test Data Output (output)

Serial output for JTAG. In flexible mode (Refer to the JTAG pins functionality table), TDO is active when the TMS pin is set LOW. This pin functions as an I/O when the JTAG state machine reaches the "logic reset" state.

### V<sub>CCI</sub> Supply Voltage

Supply voltage for I/Os.

### V<sub>CCA</sub> Supply Voltage

Supply voltage for Array.

### V<sub>CCR</sub> Supply Voltage

Supply voltage for input tolerance (required for internal biasing).

**Table 1 • Supply Voltages**

|                               | V <sub>CCA</sub> | V <sub>CCI</sub> | V <sub>CCR</sub> | Input Tolerance | Output Drive |

### SX Family Architecture

The SX Family architecture was designed to satisfy next-generation performance and integration requirements for production-volume designs in a broad range of applications.

#### Programmable Interconnect Element

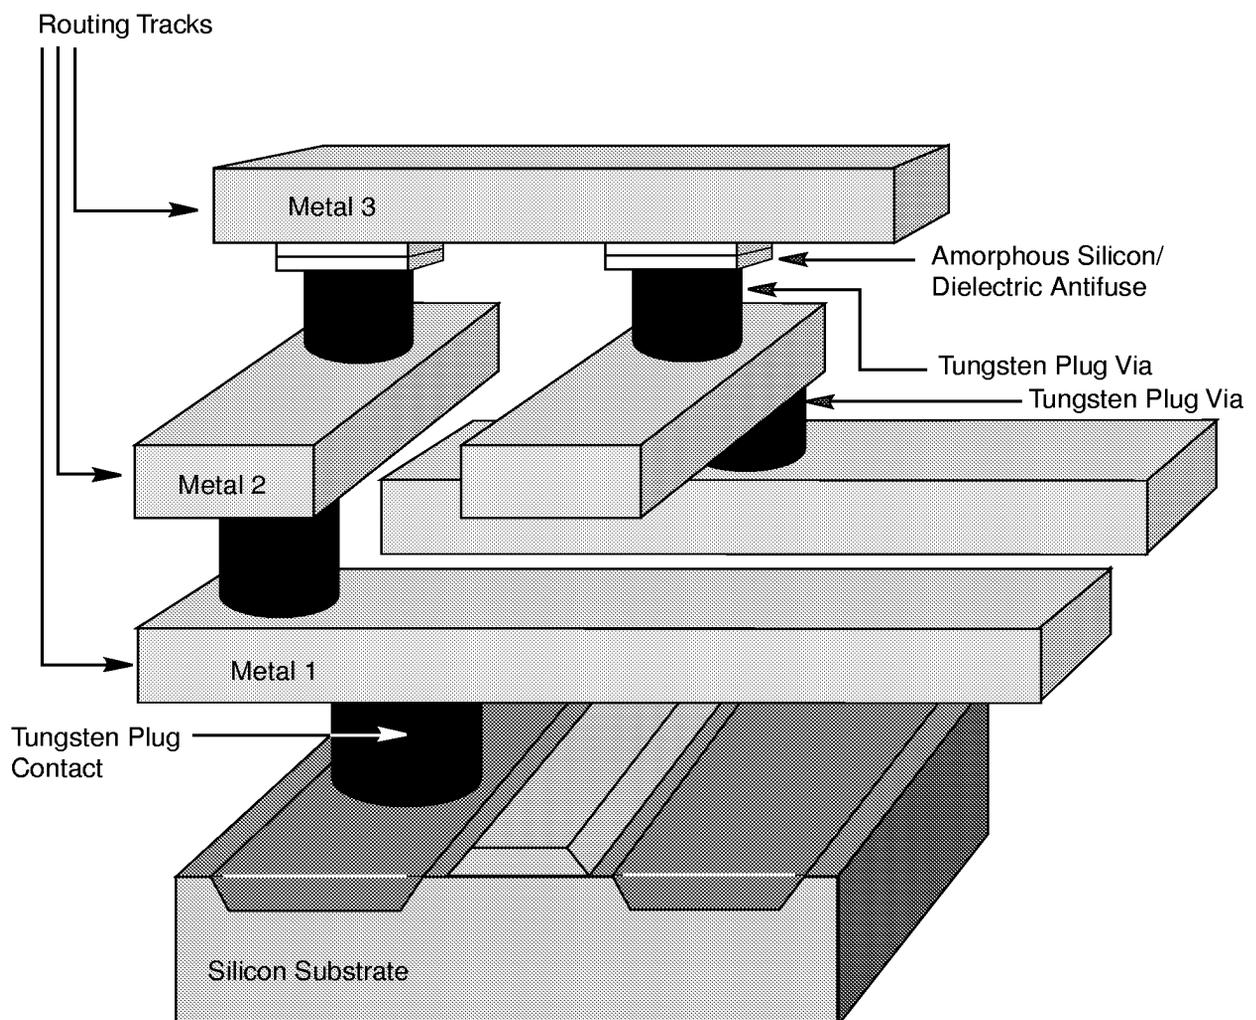

Actel's new SX Family provides much more efficient use of silicon by locating the routing interconnect resources between the Metal 2 (M2) and Metal 3 (M3) layers (see Figure 1). This completely eliminates the channels of routing and interconnect resources between logic modules (as implemented on SRAM FPGAs and previous generations of antifuse FPGAs), and enables the entire floor of the device to be spanned with an uninterrupted grid of logic modules.

Interconnection between these logic modules is achieved using Actel's patented metal-to-metal programmable antifuse

interconnect elements, which are embedded between the M2 and M3 layers. The antifuses are normally open circuit and, when programmed, form a permanent low-impedance connection.

The extremely small size of these interconnect elements gives the SX Family abundant routing resources and provides excellent protection against design pirating. Reverse engineering is virtually impossible as it is extremely difficult to distinguish between programmed and unprogrammed antifuses, and there is no configuration bitstream to intercept.

Additionally, the interconnect (i.e., the antifuses and metal tracks) have lower capacitance and lower resistance than any other device of similar capacity, leading to the fastest signal propagation in the industry.

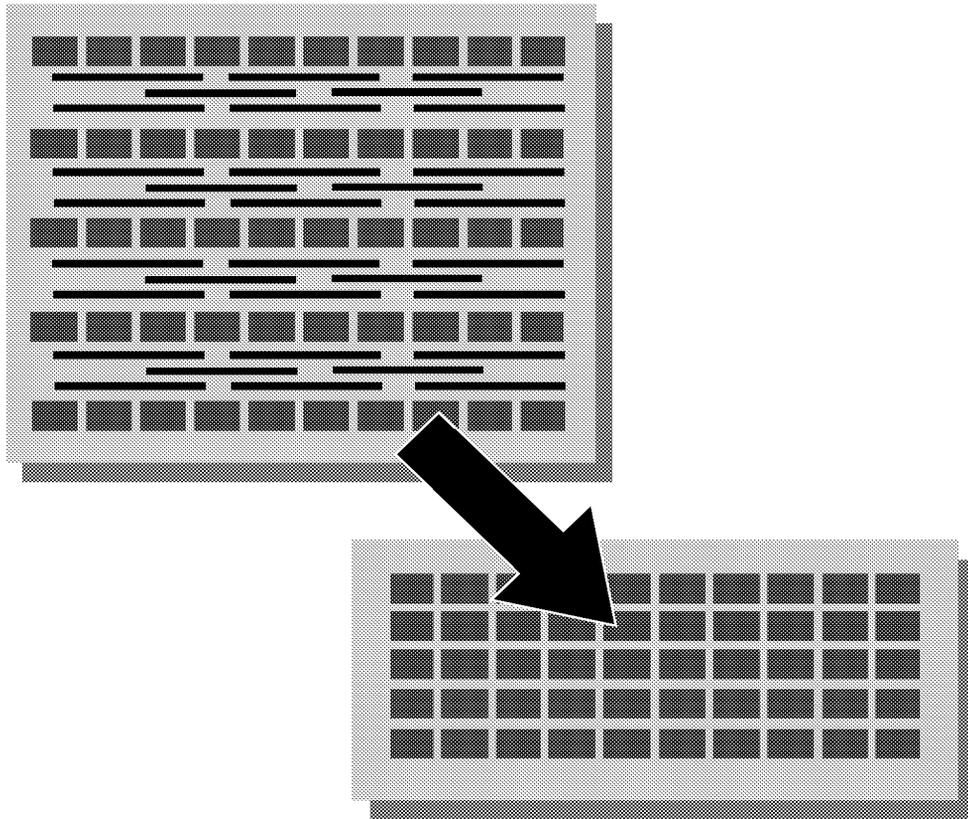

**Figure 1** • SX Family Interconnect Elements

## Logic Module Design

The SX Family architecture has been called a “sea-of-modules” architecture because the entire floor of the device is covered with a grid of logic modules with virtually no

chip area lost to interconnect elements or routing (see Figure 2). Actel provides two types of logic modules, the R-cell and the C-cell.

Channelled Array Architecture

Sea-of-Modules Architecture

**Figure 2 • Channelled Array and Sea-of-Modules Architectures**

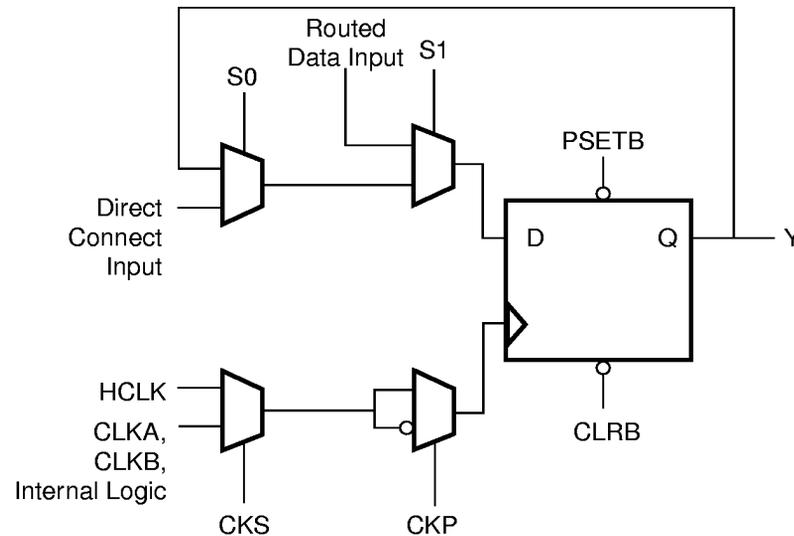

The R-cell (or register cell) contains a flip-flop featuring more control signals than in previous Actel architectures, including asynchronous clear, asynchronous preset, and clock enable (using the S0 and S1 lines). The R-cell (Figure 3) registers feature programmable clock polarity, selectable on a register-by-register basis. This provides the designer with additional flexibility while allowing mapping of synthesized functions into the SX FGPA. The clock source for the R-cell can be chosen from the hard-wired clock or the routed clock.

The C-cell (or combinatorial cell, Figure 4) implements a range of combinatorial functions up to 5-inputs. Inclusion of the DB input and its associated inverter function dramatically increases the number of combinatorial functions which can be implemented in a single module from 800 options in previous architectures to more than 4,000 in the SX

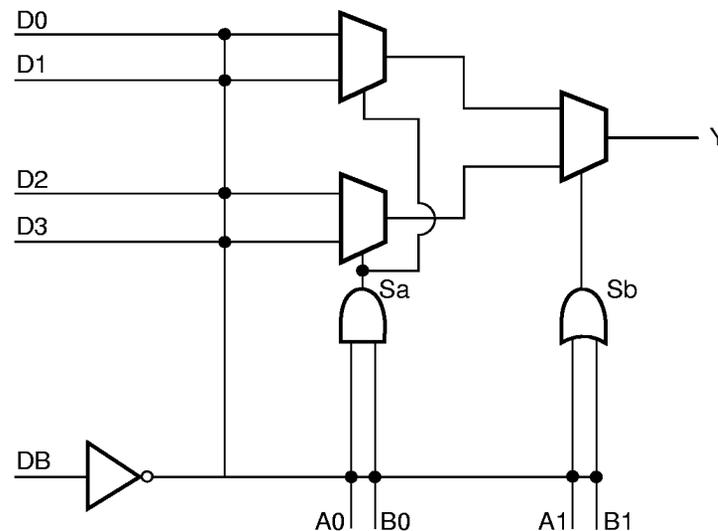

architecture. An example of the improved flexibility enabled by the inversion capability is the ability to integrate a 3-input exclusive-OR function into a single C-cell. This facilitates construction of 9-bit parity-tree functions with 2 ns propagation delays. At the same time, the C-cell structure is extremely synthesis-friendly, simplifying the overall design and reducing synthesis time.

### Chip Architecture

The SX Family's chip architecture provides a unique approach to module organization and chip routing that delivers the best register/logic mix for a wide variety of new and emerging applications.

**Figure 3 • R-Cell**

**Figure 4 • C-Cell**

#### Module Organization

Actel has arranged all C-cell and R-cell logic modules into horizontal banks called *Clusters*. There are two types of Clusters: Type 1 contains two C-cells and one R-cell, while Type 2 contains one C-cell and two R-cells.

To increase design efficiency and device performance, Actel has further organized these modules into *SuperClusters* (see Figure 5). SuperCluster 1 is a two-wide grouping of Type 1 clusters. SuperCluster 2 is a two-wide group containing one Type 1 cluster and one Type 2 cluster. SX devices feature significantly more SuperCluster 1 modules than SuperCluster

2 modules because designers typically require significantly more combinatorial logic than flip-flops.

#### Routing Resources

Clusters and SuperClusters can be connected through the use of two innovative new local routing resources called *FastConnect* and *DirectConnect* which enable extremely fast and predictable interconnection of modules within Clusters and SuperClusters (see Figure 6 and Figure 7). This routing architecture also dramatically reduces the number of antifuses required to complete a circuit, ensuring the highest possible performance.

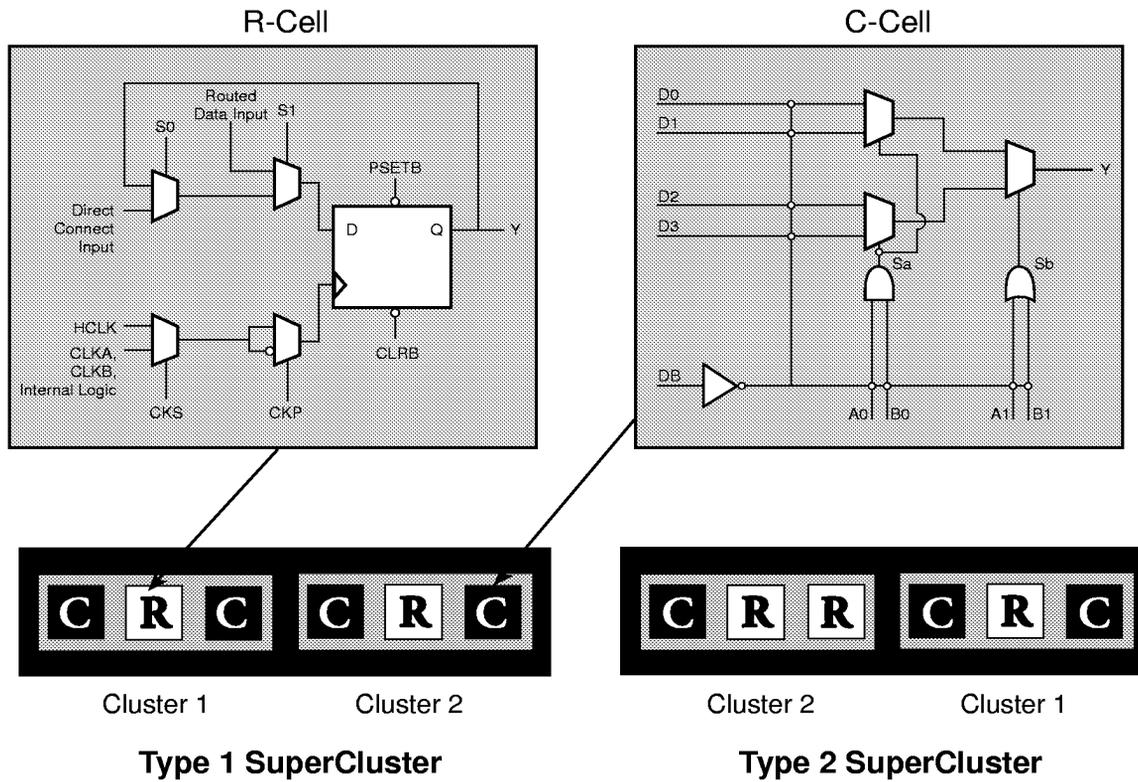

Figure 5 • Cluster Organization

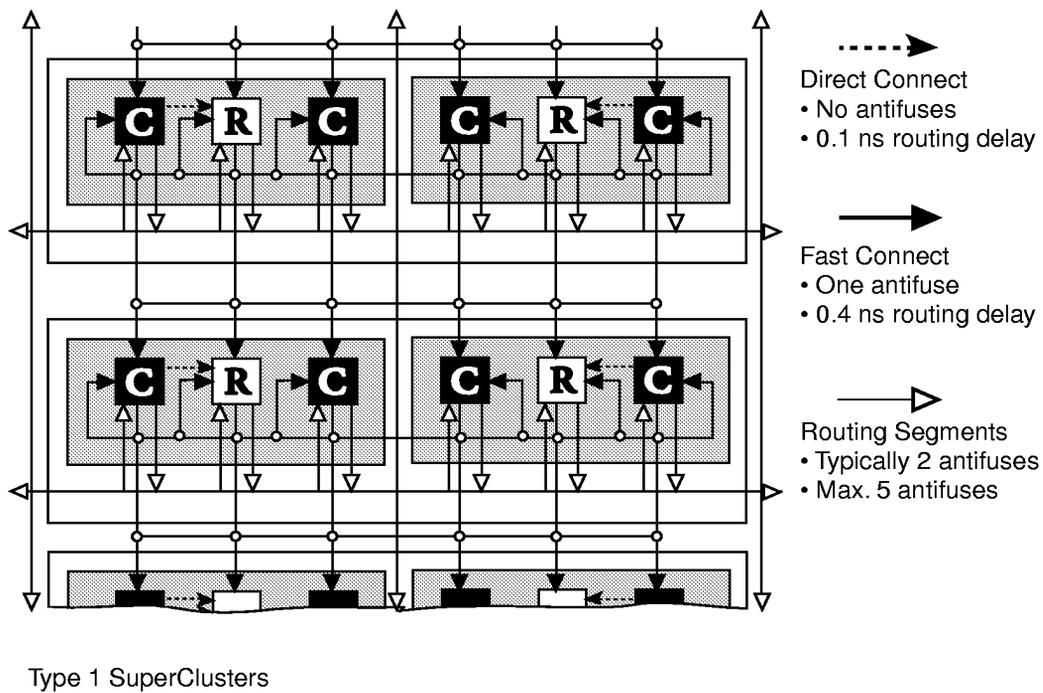

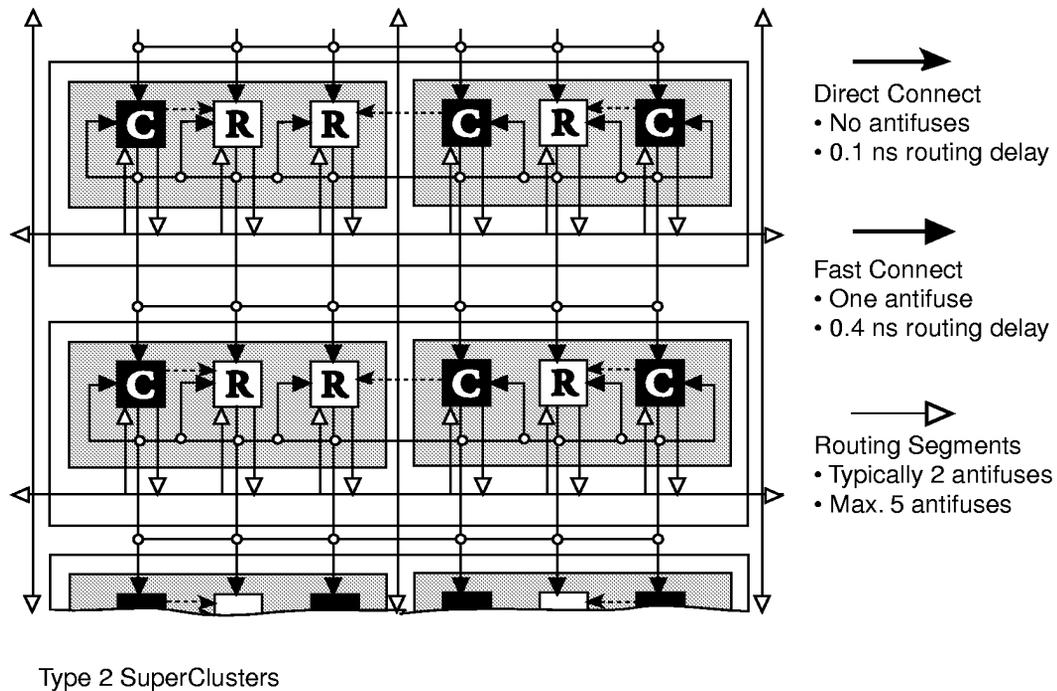

Figure 6 • DirectConnect and FastConnect for Type 1 SuperClusters

**Figure 7 • DirectConnect and FastConnect for Type2 SuperClusters**

DirectConnect is a horizontal routing resource that provides connections from a C-cell to its neighboring R-cell in a given SuperCluster. DirectConnect uses a hard-wired signal path requiring no programmable interconnection to achieve its fast signal propagation time of less than 0.1 ns.

FastConnect enables horizontal routing between any two logic modules within a given SuperCluster, and vertical routing with the SuperCluster immediately below it. Only one programmable connection is used in a FastConnect path, delivering maximum pin-to-pin propagation of 0.4 ns.

In addition to DirectConnect and FastConnect, the architecture makes use of two globally-oriented routing resources known as segmented routing and high-drive routing. Actel's segmented routing structure provides a variety of track lengths for extremely fast routing between SuperClusters. The exact combination of track lengths and antifuses within each path is chosen by the 100% automatic place and route software to minimize signal propagation delays.

Actel's high-drive routing structure provides three clock networks. The first clock, called HCLK, is hard-wired from the HCLK buffer to the clock select MUX in each R-cell. This provides a fast propagation path for the clock signal, enabling the 4.0 ns clock-to-out (pin-to-pin) performance of the SX devices. The hard-wired clock is tuned to provide clock skew as low as 0.25 ns. The remaining two clocks (CLKA, CLKB)

are global clocks that can be sourced from external pins or from internal signal logic within the SX device.

## Other Architecture Features

### Technology

Actel's SX Family of FPGAs is implemented in high-voltage twin-well CMOS using three layers of metal and 0.35 micron design rules (moving quickly to 0.25 micron). The M2/M3 antifuse is made up of a combination of amorphous silicon and dielectric material with barrier metals, and has a programmed ("on" state) resistance of 25 ohms with capacitance of 1.6 fF for low signal impedance.

### Performance

The combination of architectural features described above enables SX devices to operate with internal clock frequencies exceeding 300 MHz, enabling very fast execution of even complex logic functions. Thus, the Actel SX Family is an optimal platform upon which to integrate the functionality previously contained in multiple CPLDs. In addition, designs which previously would have required a gate array to meet performance goals can now be integrated into an SX device with dramatic improvements in cost and time-to-market. Using timing-driven place and route tools, designers can achieve highly deterministic device performance.

With SX devices, designers can achieve a higher level of performance without recourse to complicated performance-enhancing design techniques such as the use of redundant logic to reduce fanout on critical nets or the instantiation of macros in HDL code.

#### I/O Modules

Each I/O on an SX device can be configured as an input, an output, a tri-state output, or a bi-directional pin. Even without the inclusion of dedicated I/O registers, these I/Os, in combination with array registers, can achieve clock-to-out (pad-to-pad) timing as fast as 4.0 ns, and external set-up time as low as 0.6 ns. I/O cells including embedded latches and flip-flops require instantiation in HDL code, a complication not required by SX FPGAs. Fast pin-to-pin timing ensures that the device will have little trouble interfacing with any other device in the system, which in turn enables parallel design of system components and reducing overall design time.

#### Power Requirements

The SX Family supports 3.3-volt operation and is designed to tolerate 5-volt inputs. Power consumption is extremely low due to the very short distances signals are required to travel to complete a circuit. Power requirements are further reduced due to the small number of antifuses in the path, and because of the low resistance properties of the antifuses. The antifuse architecture does not require active circuitry to hold a charge (as an SRAM or EPROM does), thereby making it the lowest-power architecture on the market.

#### JTAG

All SX devices are IEEE 1149.1 (JTAG) compliant. SX devices offer superior diagnostic and testing capabilities by providing JTAG and probing capabilities. These functions are controlled through the special JTAG pins in conjunction with the program fuse. The functionality of each pin is described in Table 2.

**Table 2 • JTAG**

| <b>Program Fuse Blown<br/>(Dedicated JTAG Mode)</b> | <b>Program Fuse Not Blown<br/>(Flexible Mode)</b>  |
|---|--|
| TCK, TDI, TDO are dedicated JTAG pins               | TCK, TDI, TDO are flexible and may be used as I/Os |
| No need for pull-up resistor for TMS                | Use a pull-up resistor of 10K ohm on TMS           |

In the dedicated JTAG mode, TCK, TDI and TDO are dedicated JTAG pins and cannot be used as regular I/Os. In flexible mode, TMS should be set HIGH through a pull-up resistor of 10K ohm. TMS can be pulled LOW to initiate the JTAG sequence.

The program fuse determines whether the device is in dedicated or flexible mode. The default (fuse not blown) is flexible mode.

#### Design Tool Support

As with all Actel FPGAs, the new SX Family is fully supported by Actel's Designer Series development tools, which include:

- DirectTime for automated, timing-driven place and route;
- ACTgen for fast development using a wide range of macro functions; and
- ACTmap for logic synthesis.

Designer Series supports industry-leading VHDL and Verilog-based design tools, including synthesis tools from industry leaders such as Exemplar Logic, Synplicity, and Synopsys.

#### Silicon Explorer and SX FPGA

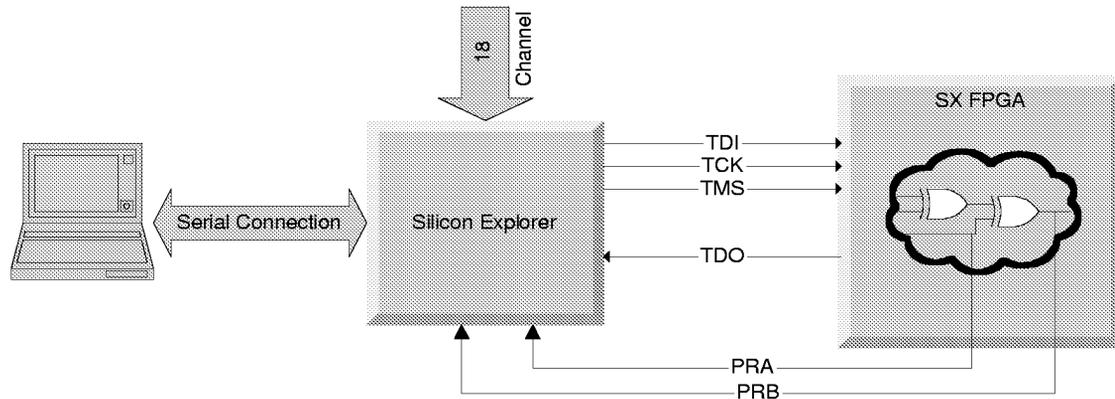

Actel SX FPGAs include internal Probe circuitry to dynamically observe and analyze any signal inside the FPGA during normal device operation. The Probe circuitry is accessed and controlled by the Silicon Explorer—an integrated debugging and logic analysis tool that attaches to a PC. The Silicon Explorer is also an 18-channel logic analyzer that samples data at 100 MHz (asynchronous) or 66 MHz (synchronous). Two channels of the logic analyzer have a direct connection to PRA and PRB pins, which can automatically display any two signals inside the FPGA. The remaining 16 channels of the logic analyzer can be used to examine other signals on the board. In addition, Silicon Explorer can read back the design's checksum, allowing designers to verify that the correct design was programmed in the FPGA.

#### SX Probe Circuit Control Pins

The Silicon Explorer tool uses the JTAG ports (TDI, TCK, TMS and TDO) to select the desired nets for debugging. The selected internal nets are assigned to the PRA/PRB pins for observation. Figure 8 illustrates the interconnection between the Silicon Explorer and the FPGA to perform in-circuit debugging.

#### Design Considerations

Avoid using the TDI, TCK, TDO, PRA and PRB pins as input or bi-directional ports. Because these pins are active during probing, critical signal input through these pins is not available while probing. In addition, do not program the Security Fuse. Programming the Security Fuse disables the Probe Circuitry.

**Figure 8 • Probe Setup**

### 3.3V/5V Operating Conditions

#### Absolute Maximum Ratings<sup>1</sup>

| Symbol      | Parameter   | Limits       | Units |
|-------------|---|--------------|-------|
| $V_{CCR}^2$ | DC Supply Voltage <sup>3</sup>                      | -0.3 to +6.0 | V     |
| $V_{CCA}^2$ | DC Supply Voltage                                   | -0.3 to +4.0 | V     |
| $V_{CCI}^2$ | DC Supply Voltage<br>(A54SX08, A54SX16,<br>A54SX32) | -0.3 to +4.0 | V     |
| $V_{CC1}^2$ | DC Supply Voltage<br>(A54SX16P)                     | -0.3 to +6.0 | V     |
| $V_I$       | Input Voltage                                       | -0.5 to +5.5 | V     |
| $V_O$       | Output Voltage                                      | -0.5 to +3.6 | V     |
| $I_{IO}$    | I/O Source Sink<br>Current <sup>3</sup>             | -30 to +5.0  | mA    |
| $T_{STG}$   | Storage Temperature                                 | -40 to +125  | °C    |

**Notes:**

1. Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. Exposure to absolute maximum rated conditions for extended periods may affect device reliability. Device should not be operated outside the Recommended Operating Conditions.
2.  $V_{CCR}$  in the A54SX16P must be greater than or equal to  $V_{CCI}$  during power-up and power-down sequences and during normal operation.
3. Device inputs are normally high impedance and draw extremely low current. However, when input voltage is greater than  $V_{CC} + 0.5V$  or less than  $GND - 0.5V$ , the internal protection diodes will forward-bias and can draw excessive current.

#### Recommended Operating Conditions

| Parameter                      | Commercial | Industrial | Military    | Units      |
|--------------------------------|------------|------------|-------------|------------|
| Temperature Range <sup>1</sup> | 0 to +70   | -40 to +85 | -55 to +125 | °C         |
| 3.3V Power Supply Tolerance    | ±10        | ±10        | ±10         | % $V_{CC}$ |
| 5V Power Supply Tolerance      | ±5         | ±10        | ±10         | % $V_{CC}$ |

**Note:**

1. Ambient temperature ( $T_A$ ) is used for commercial and industrial; case temperature ( $T_C$ ) is used for military.

## Electrical Specifications

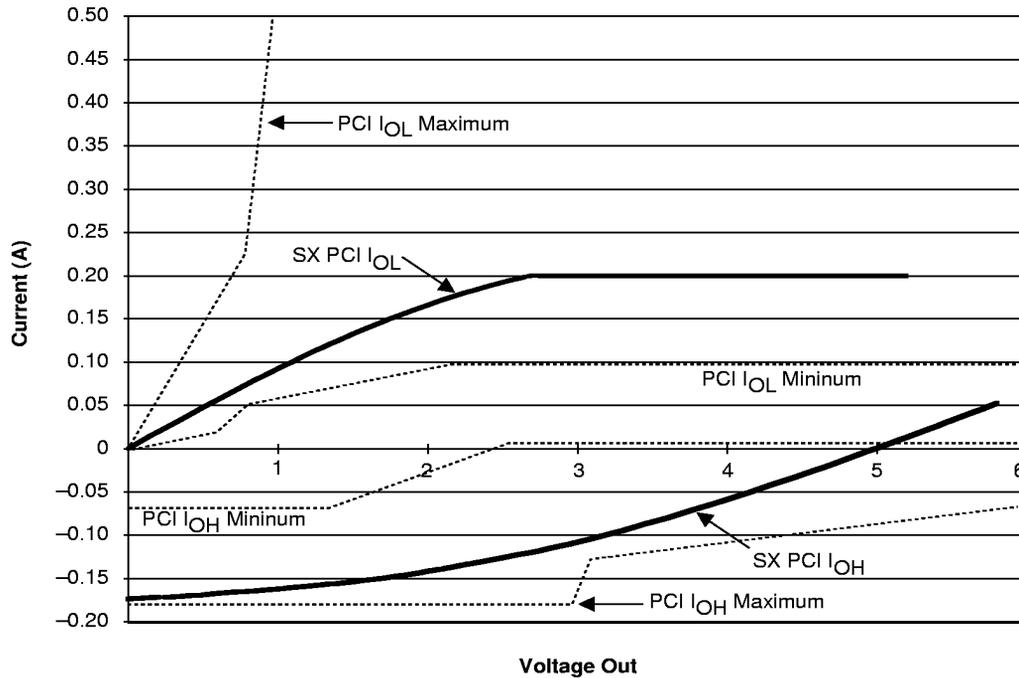

| Symbol      | Parameter  | Commercial   |                        | Industrial                 |                        | Units |

**Note:** See IEEE PCI specification for A54SX16P 3.3V and 5.0V PCI operation.

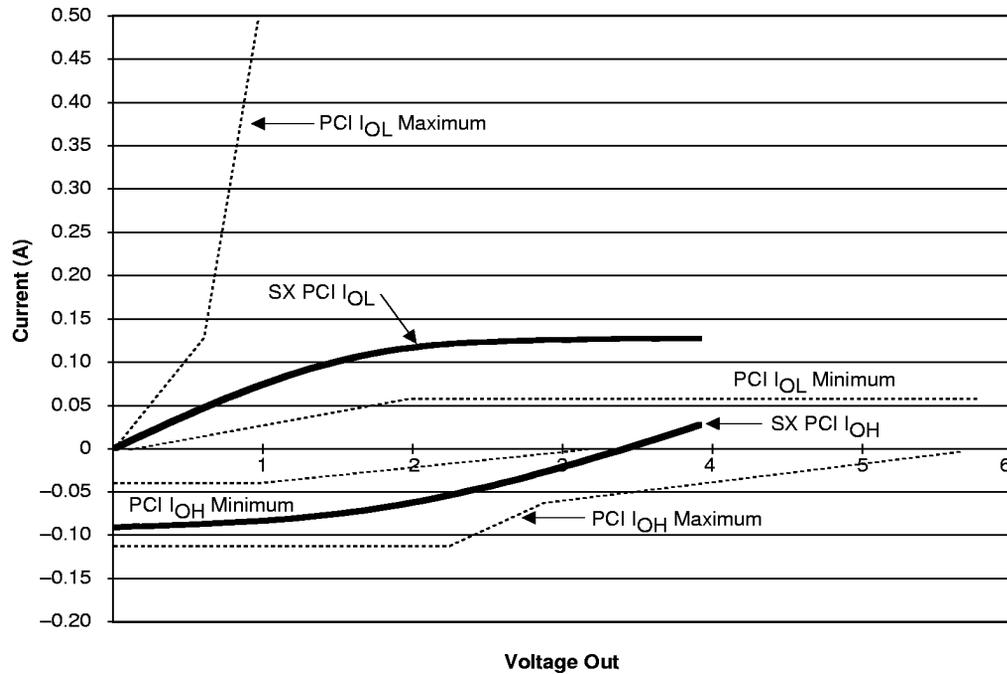

### PCI Compliance for 54SX Family

The 54SX family supports 3.3V and 5V PCI and is compliant with the PCI Local Bus Specification Rev. 2.1. Figure 9 and

Figure 10 show the V/I curves and the minimum and maximum PCI drive characteristics of the 54SX family.

**Figure 9 • 5.0V PCI Curve for 54SX Family**

## Evaluating Power in 54SX Devices

A critical element of system reliability is the ability of electronic devices to safely dissipate the heat generated during operation. The thermal characteristics of a circuit depend on the device and package used, the operating temperature, the operating current, and the system's ability to dissipate heat.

You should complete a power evaluation early in the design process to help identify potential heat-related problems in the system and to prevent the system from exceeding the device's maximum allowed junction temperature.

The actual power dissipated by most applications is significantly lower than the power the package can dissipate. However, a thermal analysis should be performed for all projects. To perform a power evaluation, follow these steps:

- Estimate the power consumption of the application.
- Calculate the maximum power allowed for the device and package.
- Compare the estimated power and maximum power values.

## Estimating Power Consumption

The total power dissipation for the 54SX family is the sum of the DC power dissipation and the AC power dissipation. Use Equation 1 to calculate the estimated power consumption of your application.

$$P_{\text{Total}} = P_{\text{DC}} + P_{\text{AC}} \quad (1)$$

## DC Power Dissipation

The power due to standby current is typically a small component of the overall power. The Standby power is shown below for commercial, worst case conditions (70°C).

| I <sub>CC</sub> | V <sub>CC</sub> | Power  |
|-----------------|-----------------|--------|
| 4mA             | 3.6V            | 14.4mW |

The DC power dissipation is defined in Equation 2 as follows:

$$P_{\text{DC}} = (I_{\text{standby}}) \cdot V_{\text{CCA}} + (I_{\text{standby}}) \cdot V_{\text{CCR}} + (I_{\text{standby}}) \cdot V_{\text{CCI}} + X \cdot V_{\text{OL}} \cdot I_{\text{OL}} + Y \cdot (V_{\text{CCI}} - V_{\text{OH}}) \cdot V_{\text{OH}} \quad (2)$$

## AC Power Dissipation

The power dissipation of the 54SX Family is usually dominated by the dynamic power dissipation. Dynamic power dissipation is a function of frequency, equivalent capacitance and power supply voltage. The AC power dissipation is defined as follows:

$$P_{\text{AC}} = P_{\text{Module}} + P_{\text{RCLKA Net}} + P_{\text{RCLKB Net}} + P_{\text{HCLK Net}} + P_{\text{Output Buffer}} + P_{\text{Input Buffer}} \quad (3)$$

$$P_{\text{AC}} = V_{\text{CCA}}^2 \cdot [(m \cdot C_{\text{EQM}} \cdot f_m)_{\text{Module}} + (n \cdot C_{\text{EQI}} \cdot f_n)_{\text{Input Buffer}} + (p \cdot (C_{\text{EQO}} + C_L) \cdot f_p)_{\text{Output Buffer}} + (0.5 \cdot (q_1 \cdot C_{\text{EQCR}} \cdot f_{q1}) + (r_1 \cdot f_{q1}))_{\text{RCLKA}} + (0.5 \cdot (q_2 \cdot C_{\text{EQCR}} \cdot f_{q2}) + (r_2 \cdot f_{q2}))_{\text{RCLKB}} + (0.5 \cdot (s_1 \cdot C_{\text{EQHV}} \cdot f_{s1}) + (C_{\text{EQHF}} \cdot f_{s1}))_{\text{HCLK}}] \quad (4)$$

**Definition of Terms Used in Formula**

|            |   |  |
|------------|---|--|
| $m$        | = | Number of logic modules switching at $f_m$             |
| $n$        | = | Number of input buffers switching at $f_n$             |
| $p$        | = | Number of output buffers switching at $f_p$            |
| $q_1$      | = | Number of clock loads on the first routed array clock  |
| $q_2$      | = | Number of clock loads on the second routed array clock |
| $x$        | = | Number of I/Os at logic low                            |
| $y$        | = | Number of I/Os at logic high                           |
| $r_1$      | = | Fixed capacitance due to first routed array clock      |
| $r_2$      | = | Fixed capacitance due to second routed array clock     |
| $s_1$      | = | Number of clock loads on the dedicated array clock     |
| $C_{EQM}$  | = | Equivalent capacitance of logic modules in pF          |
| $C_{EQI}$  | = | Equivalent capacitance of input buffers in pF          |
| $C_{EQO}$  | = | Equivalent capacitance of output buffers in pF         |
| $C_{EQCR}$ | = | Equivalent capacitance of routed array clock in pF     |
| $C_{EQHV}$ | = | Variable capacitance of dedicated array clock          |
| $C_{EQHF}$ | = | Fixed capacitance of dedicated array clock             |
| $C_L$      | = | Output lead capacitance in pF                          |
| $f_m$      | = | Average logic module switching rate in MHz             |
| $f_n$      | = | Average input buffer switching rate in MHz             |
| $f_p$      | = | Average output buffer switching rate in MHz            |
| $f_{q1}$   | = | Average first routed array clock rate in MHz           |
| $f_{q2}$   | = | Average second routed array clock rate in MHz          |
| $f_{s1}$   | = | Average dedicated array clock rate in MHz              |

 **$C_{EQ}$  Values**

|                 | A54SX08 | A54SX16 | A54SX16P | A54SX32 |
|-----------------|---------|---------|----------|---------|
| $C_{EQM}$ (pF)  | 3.9     | 3.9     | 3.9      | 3.9     |
| $C_{EQI}$ (pF)  | 8.8     | 8.8     | 8.8      | 8.8     |
| $C_{EQO}$ (pF)  | 4.7     | 4.7     | 4.7      | 4.7     |
| $C_{EQCR}$ (pF) | 1.6     | 1.6     | 1.6      | 1.6     |
| $C_{EQHV}$      | 0.623   | 0.623   | 0.623    | 0.623   |
| $C_{EQHF}$      | 96      | 96      | 96       | 96      |
| $r_1$ (pF)      | 119     | 119     | 119      | 119     |
| $r_2$ (pF)      | 119     | 119     | 119      | 119     |

**Guidelines for Calculating Power Consumption**

The following guidelines are meant to represent worst-case scenarios so that they can be generally used to predict the upper limits of power dissipation. These guidelines are as follows:

|   |   |                        |
|---|---|------------------------|
| Logic Modules ( $m$ )                               | = | 20% of modules         |
| Inputs Switching ( $n$ )                            | = | # inputs/4             |
| Outputs Switching ( $p$ )                           | = | # output/4             |
| First Routed Array Clock Loads ( $q_1$ )            | = | 20% of register cells  |
| Second Routed Array Clock Loads ( $q_2$ )           | = | 20% of register cells  |
| Load Capacitance ( $C_L$ )                          | = | 35 pF                  |
| Average Logic Module Switching Rate ( $f_m$ )       | = | $f/10$                 |
| Average Input Switching Rate ( $f_n$ )              | = | $f/5$                  |
| Average Output Switching Rate ( $f_p$ )             | = | $f/10$                 |
| Average First Routed Array Clock Rate ( $f_{q1}$ )  | = | $f/2$                  |
| Average Second Routed Array Clock Rate ( $f_{q2}$ ) | = | $f/2$                  |
| Average Dedicated Array Clock Rate ( $f_{s1}$ )     | = | $f$                    |
| Dedicated Clock Array clock loads ( $s_1$ )         | = | 20% of regular modules |

**Sample Power Calculation**

One of the designs used to characterize the A54SX family was a 528 bit serial in serial out shift register. The design utilized 100% of the dedicated flip-flops of a A54SX16P device. A pattern of 0101... was clocked into the device at frequencies ranging from 1 MHz to 200 MHz. Shifting in a series of 0101... caused 50% of the flip-flops to toggle from low to high at every clock cycle.

Follow the steps below to estimate power consumption. The values provided for the sample calculation below are for the shift register design above. This method for estimating power consumption is conservative and the actual power consumption of your design may be less than the estimated power consumption.

The total power dissipation for the 54SX family is the sum of the AC power dissipation and the DC power dissipation.

$$P_{\text{Total}} = P_{\text{AC}} (\text{dynamic power}) + P_{\text{DC}} (\text{static power}) \quad (5)$$

### AC Power Dissipation

$$P_{AC} = P_{Module} + P_{RCLKA\ Net} + P_{RCLKB\ Net} + P_{HCLK\ Net} + P_{Output\ Buffer} + P_{Input\ Buffer} \quad (6)$$

$$P_{AC} = V_{CCA}^2 * [(m * C_{EQM} * f_m)_{Module} + (n * C_{EQI} * f_n)_{Input\ Buffer} + (p * (C_{EQO} + C_L) * f_p)_{Output\ Buffer} + (0.5 * (q_1 * C_{EQCR} * f_{q1}) + (r_1 * f_{q1}))_{RCLKA} + (0.5 * (q_2 * C_{EQCR} * f_{q2}) + (r_2 * f_{q2}))_{RCLKB} + (0.5 * (s_1 * C_{EQHV} * f_{s1}) + (C_{EQHF} * f_{s1}))_{HCLK}] \quad (7)$$

#### Step #1: Define Terms Used in Formula

|  |            |       |
|--|------------|-------|
| $V_{CCA}$  |            | 3.3   |
| <b>Module</b>  |            |       |
| Number of logic modules switching at $f_m$ (Used 50%)                | $m$        | 264   |
| Average logic modules switching rate $f_m$ (MHz) (Guidelines: f/10)  | $f_m$      | 20    |
| Module capacitance $C_{EQM}$ (pf)                                    | $C_{EQM}$  | 3.9   |
| <b>Input Buffer</b>  |            |       |
| Number of input buffers switching at $f_n$                           | $n$        | 1     |
| Average input switching rate $f_n$ (MHz) (Guidelines: f/5)           | $f_n$      | 40    |
| Input buffer capacitance $C_{EQI}$ (pf)                              | $C_{EQI}$  | 8.8   |
| <b>Output Buffer</b>   |            |       |
| Number of output buffers switching at $f_p$                          | $p$        | 1     |
| Average output buffers switching rate $f_p$ (MHz) (Guidelines: f/10) | $f_p$      | 20    |
| Output buffers buffer Capacitance $C_{EQO}$ (pf)                     | $C_{EQO}$  | 4.7   |
| Output Load capacitance $C_L$ (pf)                                   | $C_L$      | 35    |
| <b>RCLKA</b>   |            |       |
| Number of Clock loads $q_1$  | $q_1$      | 528   |
| Capacitance of routed array clock (pf)                               | $C_{EQCR}$ | 1.6   |
| Average clock rate (MHz)   | $f_{q1}$   | 200   |
| Fixed capacitance (pf)   | $r_1$      | 119.6 |
| <b>RCLKB</b>   |            |       |
| Number of Clock loads $q_2$  | $q_2$      | 0     |
| Capacitance of routed array clock (pf)                               | $C_{EQCR}$ | 1.6   |
| Average clock rate (MHz)   | $f_{q2}$   | 0     |
| Fixed capacitance (pf)   | $r_2$      | 119.6 |
| <b>HCLK</b>  |            |       |
| Number of Clock loads  | $s_1$      | 0     |
| Variable capacitance of dedicated array clock (pf)                   | $C_{EQHV}$ | 0.623 |
| Fixed capacitance of dedicated array clock (pf)                      | $C_{EQHF}$ | 96    |
| Average clock rate (MHz)   | $f_{s1}$   | 0     |

#### Step #2: Calculate Dynamic Power Consumption

|   |          |
|---|----------|
| $V_{CCA} * V_{CCA}$                                     | 10.89    |
| $m * f_m * C_{EQM}$                                     | 0.020592 |
| $n * f_n * C_{EQI}$                                     | 0.000352 |
| $p * f_p * (C_{EQO} + C_L)$                             | 0.000794 |
| $0.5 * (q_1 * C_{EQCR} * f_{q1}) + (r_1 * f_{q1})$      | 0.1084   |
| $0.5 * (q_2 * C_{EQCR} * f_{q2}) + (r_2 * f_{q2})$      | 0        |
| $0.5 * (s_1 * C_{EQHV} * f_{s1}) + (C_{EQHF} * f_{s1})$ | 0        |
| $P_{AC} = 1.417W$                                       |          |

#### Step #3: Calculate DC Power Dissipation

##### DC Power Dissipation

$$P_{DC} = (I_{standby}) * V_{CCA} + (I_{standby}) * V_{CCR} + (I_{standby}) * V_{CCI} + X * V_{OL} * I_{OL} + Y * (V_{CCI} - V_{OH}) * V_{OH} \quad (8)$$

For a rough estimate of DC Power Dissipation, only use  $P_{DC} = (I_{standby}) * V_{CCA}$ . The rest of the formula provides a very small number that can be considered negligible.

$$P_{DC} = (I_{standby}) * V_{CCA}$$

$$P_{DC} = .55mA * 3.3V$$

$$P_{DC} = 0.001815W$$

#### Step #4: Calculate Total Power Consumption

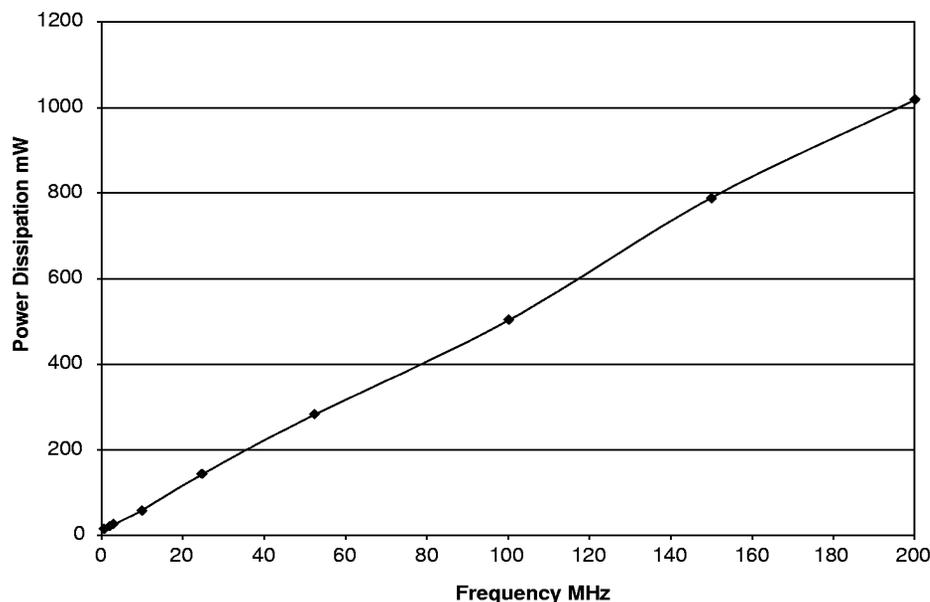

$$P_{Total} = P_{AC} + P_{DC}$$

$$P_{Total} = 1.417 + 0.001815$$

$$P_{Total} = 1.4188W$$

#### Step #5: Compare Estimated Power Consumption against Characterized Power Consumption

The estimated total power consumption for this design is 1.42W. The characterized power consumption for this design at 200MHz is 1.0164W. Figure 10 shows the characterized power dissipation numbers for the shift register design using frequencies ranging from 1MHz to 200MHz.

**Figure 11 • Power Dissipation**

#### Junction Temperature ( $T_J$ )

The temperature that you select in Designer Series software is the junction temperature, not ambient temperature. This is an important distinction because the heat generated from dynamic power consumption is usually hotter than the ambient temperature. Use the Equation 4 below to calculate junction temperature.

$$\text{Junction Temperature} = \Delta T + T_a \quad (4)$$

Where:

$T_a$  = Ambient Temperature

$\Delta T$  = Temperature gradient between junction (silicon) and ambient

$$\Delta T = \theta_{ja} * P$$

P = Power calculated from Estimating Power Consumption section

$\theta_{ja}$  = Junction to ambient of package.  $\theta_{ja}$  numbers are located in Package Thermal Characteristics section.

#### Package Thermal Characteristics

The device junction to case thermal characteristic is  $\theta_{jc}$ , and the junction to ambient air characteristic is  $\theta_{ja}$ . The thermal characteristics for  $\theta_{ja}$  are shown with two different air flow rates.

The maximum junction temperature is 150°C.

A sample calculation of the absolute maximum power dissipation allowed for a TQFP 176-pin package at commercial temperature and still air is as follows:

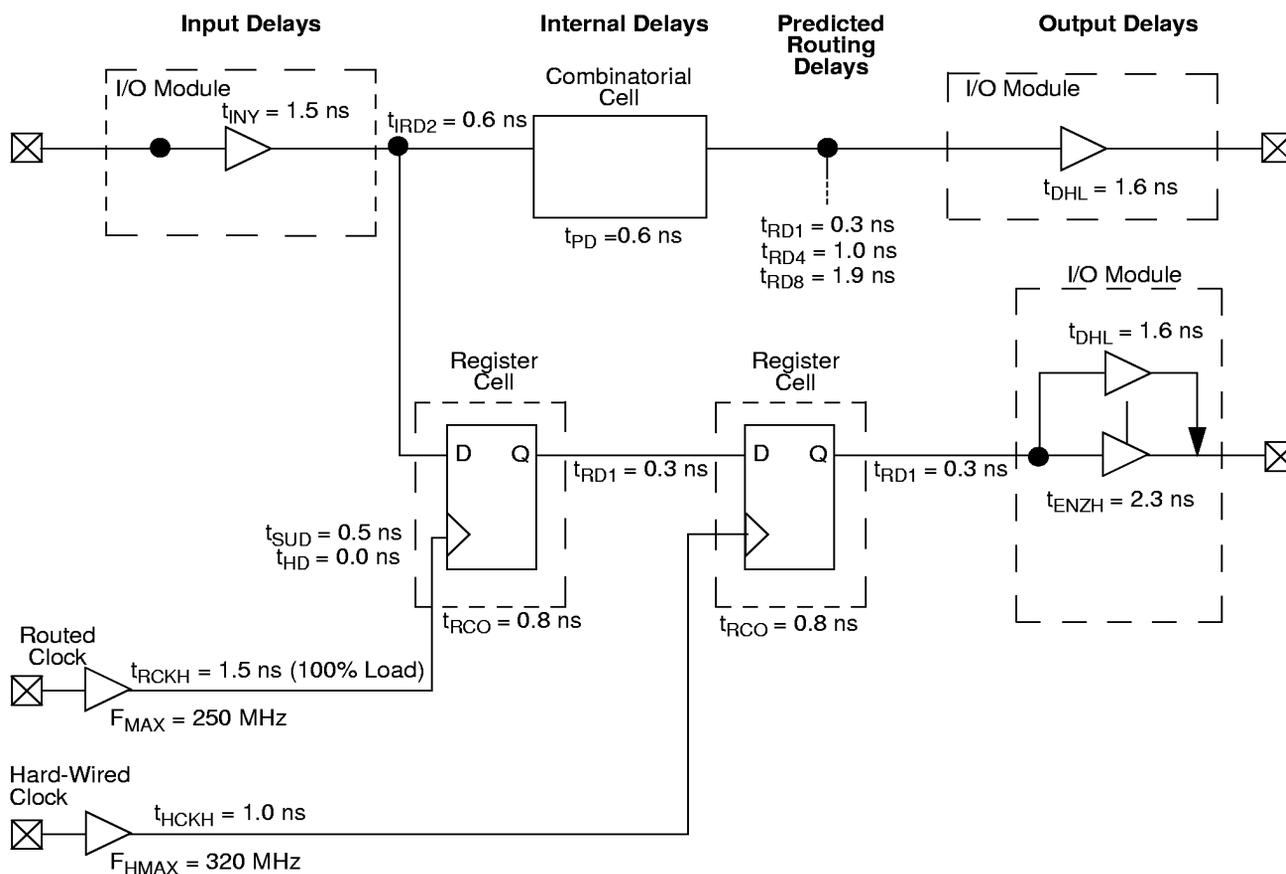

$$\text{Maximum Power Allowed} = \frac{\text{Max. junction temp. (}^\circ\text{C)} - \text{Max. ambient temp. (}^\circ\text{C)}}{\theta_{ja} \text{ (}^\circ\text{C/W)}} = \frac{150^\circ\text{C} - 70^\circ\text{C}}{28^\circ\text{C/W}} = 2.86\text{W}$$

| Package Type                                    | Pin Count | $\theta_{jc}$ | $\theta_{ja}$ |            | Units              |
|---|-----------|---------------|---------------|------------|--------------------|
|   |           |               | Still Air     | 300 ft/min |                    |
| Plastic Leaded Chip Carrier (PLCC)              | 84        | 12            | 32            | 22         | $^\circ\text{C/W}$ |
| Thin Quad Flatpack (TQFP)                       | 144       | 10            | 32            | 24         | $^\circ\text{C/W}$ |
| Thin Quad Flatpack (TQFP)                       | 176       | 11            | 28            | 21         | $^\circ\text{C/W}$ |
| Very Thin Quad Flatpack (VQFP)                  | 100       | 11            | 38            | 32         | $^\circ\text{C/W}$ |
| Plastic Quad Flatpack (PQFP) with Heat Spreader | 208       | 8             | 18            | 14         | $^\circ\text{C/W}$ |
| Plastic Ball Grid Array (PBGA)                  | 329       | 3             | 18            | 13.5       | $^\circ\text{C/W}$ |
| Plastic Ball Grid Array (PBGA)                  | 313       | 8             | 25            | 21         | $^\circ\text{C/W}$ |
| Plastic Ball Grid Array (PBGA)                  | 272       | 3             | 20            | 14.5       | $^\circ\text{C/W}$ |

Temperature and Voltage Derating Factors  
(Normalized to Worst-Case Commercial,  $T_J = 70^\circ\text{C}$ ,  $V_{CCA} = 3.0\text{V}$ )

| $V_{CCA}$ | Junction Temperature ( $T_J$ ) |      |      |      |      |      |      |
|-----------|--------------------------------|------|------|------|------|------|------|
|           | -55                            | -40  | 0    | 25   | 70   | 85   | 125  |
| 3.0       | 0.75                           | 0.78 | 0.87 | 0.89 | 1.00 | 1.04 | 1.16 |
| 3.3       | 0.70                           | 0.73 | 0.82 | 0.83 | 0.93 | 0.97 | 1.08 |

## Register Cell Timing Characteristics

### Flip-Flops

### Timing Characteristics

Timing characteristics for 54SX devices fall into three categories: family-dependent, device-dependent, and design-dependent. The input and output buffer characteristics are common to all 54SX family members. Internal routing delays are device dependent. Design dependency means actual delays are not determined until after placement and routing of the user's design is complete. Delay values may then be determined by using the DirectTime Analyzer utility or performing simulation with post-layout delays.

#### Critical Nets and Typical Nets

Propagation delays are expressed only for typical nets, which are used for initial design performance evaluation. Critical net delays can then be applied to the most time-critical paths. Critical nets are determined by net property assignment prior to placement and routing. Up to 6% of the nets in a design may be designated as critical, while 90% of the nets in a design are typical.

### Long Tracks

Some nets in the design use long tracks. Long tracks are special routing resources that span multiple rows, columns, or modules. Long tracks employ three and sometimes five antifuse connections. This increases capacitance and resistance, resulting in longer net delays for macros connected to long tracks. Typically up to 6% of nets in a fully utilized device require long tracks. Long tracks contribute approximately 4 ns to 8.4 ns delay. This additional delay is represented statistically in higher fanout (FO=24) routing delays in the data sheet specifications section.

### Timing Derating

54SX devices are manufactured in a CMOS process. Therefore, device performance varies according to temperature, voltage, and process variations. Minimum timing parameters reflect maximum operating voltage, minimum operating temperature, and best-case processing. Maximum timing parameters reflect minimum operating voltage, maximum operating temperature, and worst-case processing.

## A54SX08 Timing Characteristics

(Worst-Case Commercial Conditions,  $V_{CCR} = 4.75\text{ V}$ ,  $V_{CCA}, V_{CCI} = 3.0\text{ V}$ ,  $T_J = 70^\circ\text{C}$ )

| C-Cell Propagation Delays <sup>1</sup> |                                    | '-3' Speed |      | '-2' Speed |      | '-1' Speed |      | 'Std' Speed |      |       |

| $t_{RCO}$                              | Sequential Clock-to-Q              |            | 0.8  |            | 1.1  |            | 1.2  |             | 1.4  | ns    |
| $t_{CLR}$                              | Asynchronous Clear-to-Q            |            | 0.5  |            | 0.6  |            | 0.7  |             | 0.8  | ns    |
| $t_{PRESET}$                           | Asynchronous Preset-to-Q           |            | 0.7  |            | 0.8  |            | 0.9  |             | 1.0  | ns    |
| $t_{SUD}$                              | Flip-Flop Data Input Set-Up        | 0.5        |      | 0.5        |      | 0.7        |      | 0.8         |      | ns    |
| $t_{HD}$                               | Flip-Flop Data Input Hold          | 0.0        |      | 0.0        |      | 0.0        |      | 0.0         |      | ns    |
| $t_{WASYN}$                            | Asynchronous Pulse Width           | 1.4        |      | 1.6        |      | 1.8        |      | 2.1         |      | ns    |

**Notes:**

- For dual-module macros, use  $t_{PD} + t_{RD1} + t_{PDn}$ ,  $t_{RCO} + t_{RD1} + t_{PDn}$  or  $t_{PD1} + t_{RD1} + t_{SUD}$ , whichever is appropriate.
- Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual worst-case performance. Post-route timing is based on actual routing delay measurements performed on the device prior to shipment.

## A54SX08 Timing Characteristics (continued)

(Worst-Case Commercial Conditions)

| t <sub>IRD18</sub>                          | FO=18 Routing Delay      |            | 4.2  |            | 4.8  |            | 5.4  |             | 6.4  | ns    |
| t <sub>IRD24</sub>                          | FO=24 Routing Delay      |            | 5.5  |            | 6.3  |            | 7.1  |             | 8.4  | ns    |

**Note:**

1. Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-routetiming analysis or simulation is required to determine actual worst-case performance. Post-routetiming is based on actual routing delay measurements performed on the device prior to shipment.

(Worst-Case Commercial Conditions)

**Notes:**

1. For dual-module macros, use  $t_{PD} + t_{RD1} + t_{PDn}$ ,  $t_{RCO} + t_{RD1} + t_{PDn}$  or  $t_{PD1} + t_{RD1} + t_{SUD}$ , whichever is appropriate.
2. Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-routetiming analysis or simulation is required to determine actual worst-case performance. Post-routetiming is based on actual routing delay measurements performed on the device prior to shipment.

**Notes:**

- For dual-module macros, use  $t_{PD} + t_{RD1} + t_{PDn}$ ,  $t_{RCO} + t_{RD1} + t_{PDn}$  or  $t_{PD1} + t_{RD1} + t_{SUD}$ , whichever is appropriate.
- Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual worst-case performance. Post-route timing is based on actual routing delay measurements performed on the device prior to shipment.

**Notes:**

1. For dual-module macros, use  $t_{PD} + t_{RD1} + t_{PDn}$ ,  $t_{RCO} + t_{RD1} + t_{PDn}$  or  $t_{PD1} + t_{RD1} + t_{SUD}$ , whichever is appropriate.
2. Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-routetiming analysis or simulation is required to determine actual worst-case performance. Post-routetiming is based on actual routing delay measurements performed on the device prior to shipment.

| t <sub>IRD24</sub>                                | FO=24 Routing Delay      |            | 8.1  |            | 9.3  |            | 10.5 |             | 12.4 | ns    |

**Note:**

1. Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual worst-case performance. Post-route timing is based on actual routing delay measurements performed on the device prior to shipment.
