## Features

■ Pin-compatible with and functionally equivalent to ZBT ${ }^{\text {TM }}$
■ Supports $250-\mathrm{MHz}$ bus operations with zero wait states
■ Available speed grades are 250, 200, and 166 MHz
■ Internally self-timed output buffer control to eliminate the need to use asynchronous OE

■ Fully registered (inputs and outputs) for pipelined operation

- Byte write capability

■ Single 2.5 V power supply ( $\mathrm{V}_{\mathrm{DD}}$ )
■ Fast clock-to-output times
口 2.8 ns (for $250-\mathrm{MHz}$ device)

- Clock enable ( $\overline{\mathrm{CEN}}$ ) pin to suspend operation

■ Synchronous self-timed writes
■ Available in Pb-free 100-pin TQFP package, Pb -free and non Pb -free 119-ball BGA package and 165-ball FBGA package
■ IEEE 1149.1 JTAG-compatible boundary scan

- Burst capability-linear or interleaved burst order

■ "ZZ" sleep mode option and stop clock option

## Functional Description

The CY7C1354CV25/CY7C1356CV25 ${ }^{[1]}$ are 2.5 V , $256 \mathrm{~K} \times 36 / 512 \mathrm{~K} \times 18$ synchronous pipelined burst SRAMs with No Bus Latency ${ }^{\text {TM }}$ (NoBL ${ }^{\text {TM }}$ ) logic, respectively. They are designed to support unlimited true back-to-back read/write operations with no wait states. The CY7C1354CV25/CY7C1356CV25 are equipped with the advanced (NoBL) logic required to enable consecutive read/write operations with data being transferred on every clock cycle. This feature dramatically improves the throughput of data in systems that require frequent write/read transitions. The CY7C1354CV25/CY7C1356CV25 are pin-compatible with and functionally equivalent to ZBT devices.

All synchronous inputs pass through input registers controlled by the rising edge of the clock. All data outputs pass through output registers controlled by the rising edge of the clock. The clock input is qualified by the clock enable ( $\overline{\mathrm{CEN}}$ ) signal, which when deasserted suspends operation and extends the previous clock cycle.
Write operations are controlled by the byte write selects $\left(\overline{\mathrm{BW}}_{\mathrm{a}}-\overline{\mathrm{BW}}_{\mathrm{d}}\right.$ for CY7C1354CV25 and $\overline{\mathrm{BW}}_{\mathrm{a}}-\overline{\mathrm{BW}}_{\mathrm{b}}$ for CY7C1356CV25) and a write enable ( $\overline{\mathrm{WE}}$ ) input. All writes are conducted with on-chip synchronous self-timed write circuitry.
Three synchronous chip enables $\left(\overline{\mathrm{CE}}_{1}, \mathrm{CE}_{2}, \overline{\mathrm{CE}}_{3}\right)$ and an asynchronous output enable ( $\overline{\mathrm{OE} \text { ) provide for easy bank }}$ selection and output tri-state control. In order to avoid bus contention, the output drivers are synchronously tri-stated during the data portion of a write sequence.

## Pin Definitions

| Pin Name | I/O Type | Pin Description |
| :---: | :---: | :---: |
| $\mathrm{A}_{0}, \mathrm{~A}_{1}, \mathrm{~A}$ | Inputsynchronous | Address inputs used to select one of the address locations. Sampled at the rising edge of the CLK. |
| $\begin{aligned} & \overline{\mathrm{BW}}_{\mathrm{C}}, \overline{\mathrm{BW}}_{\mathrm{b}}, \\ & \mathrm{BW}_{\mathrm{c}}, \overline{\mathrm{BW}}^{2} \end{aligned}$ | Inputsynchronous | Byte write select inputs, active LOW. Qualified with $\overline{\mathrm{WE}}$ to conduct writes to the SRAM. Sampled on the rising edge of CLK. $\overline{B W}_{a}$ controls $\mathrm{DQ}_{\mathrm{a}}$ and $\mathrm{DQP}_{a}, \overline{\mathrm{BW}}_{\mathrm{b}}$ controls $\mathrm{DQ}_{\mathrm{b}}$ and $\mathrm{DQP}_{\mathrm{b}}, \overline{\mathrm{BW}}_{\mathrm{c}}$ controls $\mathrm{DQ}_{\mathrm{c}}$ and $\mathrm{DQP}_{\mathrm{c}}, \overline{\mathrm{BW}}_{\mathrm{d}}$ controls $\mathrm{DQ}_{\mathrm{d}}$ and $\mathrm{DQP}_{\mathrm{d}}$. |
| $\overline{\text { WE }}$ | Inputsynchronous | Write enable input, active LOW. Sampled on the rising edge of CLK if $\overline{\mathrm{CEN}}$ is active LOW. This signal must be asserted LOW to initiate a write sequence. |
| ADV/ $\overline{\mathrm{LD}}$ | Inputsynchronous | Advance/load input used to advance the on-chip address counter or load a new address. When HIGH (and CEN is asserted LOW) the internal burst counter is advanced. When LOW, a new address can be loaded into the device for an access. After being deselected, ADV/LD should be driven LOW in order to load a new address. |
| CLK | Inputclock | Clock input. Used to capture all synchronous inputs to the device. CLK is qualified with $\overline{\mathrm{CEN}}$. CLK is only recognized if $\overline{C E N}$ is active LOW. |
| $\overline{\mathrm{CE}}_{1}$ | Inputsynchronous | Chip enable 1 input, active LOW. Sampled on the rising edge of CLK. Used in conjunction with CE $_{2}$ and $\overline{\mathrm{CE}}_{3}$ to select/deselect the device. |
| $\mathrm{CE}_{2}$ | Inputsynchronous | Chip enable 2 input, active HIGH. Sampled on the rising edge of CLK. Used in conjunction with $\overline{\mathrm{CE}}{ }_{1}$ and $\mathrm{CE}_{3}$ to select/deselect the device. |
| $\overline{\mathrm{CE}}_{3}$ | Inputsynchronous | Chip enable 3 Input, active LOW. Sampled on the rising edge of CLK. Used in conjunction with $\overline{\mathrm{CE}}_{1}$ and $\mathrm{CE}_{2}$ to select/deselect the device. |
| $\overline{\mathrm{OE}}$ | Inputasynchronous | Output enable, active LOW. Combined with the synchronous logic block inside the device to contro the direction of the I/O pins. When LOW, the I/O pins are allowed to behave as outputs. When deasserted HIGH, I/O pins are tri-stated, and act as input data pins. $\overline{\mathrm{OE}}$ is masked during the data portion of a write sequence, during the first clock when emerging from a deselected state and when the device has been deselected. |
| $\overline{C E N}$ | Inputsynchronous | Clock enable input, active LOW. When asserted LOW the clock signal is recognized by the SRAM. When deasserted HIGH the clock signal is masked. Since deasserting CEN does not deselect the device, $\overline{\mathrm{CEN}}$ can be used to extend the previous cycle when required. |
| $\mathrm{DQ}_{S}$ | I/Osynchronous | Bidirectional data I/O lines. As inputs, they feed into an on-chip data register that is triggered by the rising edge of CLK. As outputs, they deliver the data contained in the memory location specified by addresses during the previous clock rise of the read cycle. The direction of the pins is controlled by OE and the internal control logic. When OE is asserted LOW, the pins can behave as outputs. When HIGH, $D Q_{a}-D Q_{d}$ are placed in a tri-state condition. The outputs are automatically tri-stated during the data portion of a write sequence, during the first clock when emerging from a deselected state, and when the device is deselected, regardless of the state of $\overline{\mathrm{OE}}$. |
| $\mathrm{DQP}_{\mathrm{x}}$ | I/Osynchronous | Bidirectional data parity I/O lines. Functionally, these signals are identical to $\mathrm{DQ}_{\text {[a:d] }}$. During write sequences, $\mathrm{DQP}_{\mathrm{a}}$ is controlled by $\overline{\mathrm{BW}}_{\mathrm{a}}, \mathrm{DQP}_{\mathrm{b}}$ is controlled by $\overline{\mathrm{BW}}_{\mathrm{b}}, \mathrm{DQP}_{\mathrm{c}}$ is controlied by $\overline{\mathrm{BW}}_{\mathrm{c}}$, and DQP ${ }_{d}$ is controlled by $\overline{B W}_{d}$. |
| MODE | Input strap pin | Mode input. Selects the burst order of the device. Tied HIGH selects the interleaved burst order. Pulled LOW selects the linear burst order. MODE should not change states during operation. When left floating MODE will default HIGH, to an interleaved burst order. |
| TDO | JTAG serial output synchronous | Serial data-out to the JTAG circuit. Delivers data on the negative edge of TCK. |
| TDI | JTAG serial input synchronous | Serial data-in to the JTAG circuit. Sampled on the rising edge of TCK. |
| TMS | Test mode select synchronous | This pin controls the test access port state machine. Sampled on the rising edge of TCK. |
| TCK | JTAG-clock | Clock input to the JTAG circuitry. |

Pin Definitions
(continued)

| Pin Name | I/O Type | Pin Description |
| :---: | :---: | :---: |
| $V_{\text {DD }}$ | Power supply | Power supply inputs to the core of the device. |
| $\mathrm{V}_{\text {DDQ }}$ | I/O power supply | Power supply for the I/O circuitry. |
| $\mathrm{V}_{\mathrm{SS}}$ | Ground | Ground for the device. Should be connected to ground of the system. |
| NC | - | No connects. This pin is not connected to the die. |
| NC/18M, NC/36M, NC/72M, NC/144M, NC/288M, NC/576M, NC/1G | - | These pins are not connected. They will be used for expansion to the 18M, 36M, 72M,144M 288M, 576M, and 1G densities. |
| ZZ | Inputasynchronous | ZZ "sleep" Input. This active HIGH input places the device in a non-time critical "sleep" condition with data integrity preserved. For normal operation, this pin has to be LOW or left floating. ZZ pin has an internal pull-down. |

## Functional Overview

## The <br> CY7C1354CV25/CY7C1356CV25 <br> are

 synchronous-pipelined burst NoBL SRAMs designed specifically to eliminate wait states during write/read transitions. All synchronous inputs pass through input registers controlled by the rising edge of the clock. The clock signal is qualified with the clock enable input signal (CEN). If CEN is HIGH, the clock signal is not recognized and all internal states are maintained. All synchronous operations are qualified with CEN. All data outputs pass through output registers controlled by the rising edge of the clock. Maximum access delay from the clock rise ( $\mathrm{t}_{\mathrm{co}}$ ) is 2.8 ns (250-MHz device).Accesses can be initiated by asserting all three chip enables $\left(\overline{C E}_{1}, C E_{2}, \overline{\mathrm{CE}}_{3}\right)$ active at the rising edge of the clock. If clock enable (CEN) is active LOW and ADV/LD is asserted LOW, the address presented to the device will be latched. The access can either be a read or write operation, depending on the status of the write enable ( $\overline{\mathrm{WE}}) . \overline{\mathrm{BW}}_{\text {[d:a] }}$ can be used to conduct byte write operations.
Write operations are qualified by the write enable ( $\overline{\mathrm{WE}})$. All writes are simplified with on-chip synchronous self-timed write circuitry.
Three synchronous chip enables ( $\left.\overline{\mathrm{CE}}_{1}, \mathrm{CE}_{2}, \overline{\mathrm{CE}}_{3}\right)$ and an asynchronous output enable (OE) simplify depth expansion. All operations (reads, writes, and deselects) are pipelined. ADV/LD should be driven LOW once the device has been deselected in order to load a new address for the next operation.

## Single Read Accesses

A read access is initiated when the following conditions are satisfied at clock rise: (1) CEN is asserted LOW, (2) $\mathrm{CE}_{1}, \mathrm{CE}_{2}$, and $\overline{\mathrm{CE}}_{3}$ are all asserted active, (3) the write enable input signal WE is deasserted HIGH, and (4) ADV/LD is asserted LOW. The address presented to the address inputs is latched into the address register and presented to the memory core and control logic. The control logic determines that a read access is in progress and allows the requested data to propagate to the input of the output register. At the rising edge of the next clock the requested data is allowed to propagate through the output
register and onto the data bus within 2.8 ns ( $250-\mathrm{MHz}$ device) provided OE is active LOW. After the first clock of the read access the output buffers are controlled by $\overline{\mathrm{OE}}$ and the internal control logic. OE must be driven LOW in order for the device to drive out the requested data. During the second clock, a subsequent operation (read/write/deselect) can be initiated. Deselecting the device is also pipelined. Therefore, when the SRAM is deselected at clock rise by one of the chip enable signals, its output will tri-state following the next clock rise.

## Burst Read Accesses

The CY7C1354CV25/CY7C1356CV25 have an on-chip burst counter that allows the user the ability to supply a single address and conduct up to four reads without reasserting the address inputs. ADV/LD must be driven LOW in order to load a new address into the SRAM, as described in Single Read Accesses. The sequence of the burst counter is determined by the MODE input signal. A LOW input on MODE selects a linear burst mode, a HIGH selects an interleaved burst sequence. Both burst counters use A0 and A1 in the burst sequence, and will wrap around when incremented sufficiently. A HIGH input on ADV/LD will increment the internal burst counter regardless of the state of chip enables inputs or WE. WE is latched at the beginning of a burst cycle. Therefore, the type of access (read or write) is maintained throughout the burst sequence.

## Single Write Accesses

Write access are initiated when the following conditions are satisfied at clock rise: (1) $\overline{\mathrm{CEN}}$ is asserted LOW, (2) $\overline{\mathrm{CE}}_{1}, \mathrm{CE}_{2}$, and $\overline{\mathrm{CE}}_{3}$ are all asserted active, and (3) the write signal WE is asserted LOW. The address presented to $A_{0}-A_{16}$ is loaded into the address register. The write signals are latched into the control logic block.

On the subsequent clock rise the data lines are automatically tri-stated regardless of the state of the OE input signal. This allows the external logic to present the data on DQ and DQP $\left(\mathrm{DQ}_{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}} / \mathrm{DQP}_{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}}\right.$ for CY7C1354CV25 and $\mathrm{DQ}_{\mathrm{a}, \mathrm{b}} / \mathrm{DQP}_{\mathrm{a}, \mathrm{b}}$ for CY7C1356CV25). In addition, the address for the subsequent access (read/write/deselect) is latched into the address register (provided the appropriate control signals are asserted).

On the next clock rise the data presented to DQ and DQP $\left(\mathrm{DQ}_{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}} / \mathrm{DQP}_{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}}\right.$ for CY7C1354CV25 and $\mathrm{DQ}_{\mathrm{a}, \mathrm{b}} / \mathrm{DQP}_{\mathrm{a}, \mathrm{b}}$ for CY7C1356CV25) (or a subset for byte write operations, see Write Cycle Description table for details) inputs is latched into the device and the Write is complete.
The data written during the write operation is controlled by $\overline{\mathrm{BW}}$ ( $\overline{\mathrm{BW}}_{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}}$ for CY7C1354CV25 and BW ${ }_{a, b}$ for CY7C1356CV25) signals. The CY7C1354CV25/CY7C1356CV25 provides byte write capability that is described in the Write Cycle Description table. Asserting the write enable input ( $\overline{\mathrm{WE} \text { ) with the selected }}$ byte write select ( $\overline{B W}$ ) input will selectively write to only the desired bytes. Bytes not selected during a byte write operation will remain unaltered. A synchronous self-timed write mechanism has been provided to simplify the write operations. Byte write capability has been included in order to greatly simplify read/modify/write sequences, which can be reduced to simple byte write operations.
Because the CY7C1354CV25/CY7C1356CV25 are common I/O devices, data should not be driven into the device while the outputs are active. The output enable ( $\overline{\mathrm{OE}}$ ) can be deasserted HIGH before presenting data to the DQ and DQP ( $\mathrm{DQ}_{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}} / \mathrm{DQP}_{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}}$ for CY 7 C 1354 CV 25 and $\mathrm{DQ}_{\mathrm{a}, \mathrm{b}} / \mathrm{DQP}_{\mathrm{a}, \mathrm{b}}$ for CY7C1356CV25) inputs. Doing so will tri-state the output drivers. As a safety precaution, $D Q$ and $D Q P\left(D Q_{a, b, c, d} / D P_{a, b, c, d}\right.$ for CY7C1354CV25 and DQ $_{\mathrm{a}, \mathrm{b}} / \mathrm{DQP}_{\mathrm{a}, \mathrm{b}}$ for CY7C1356CV25) are automatically tri-stated during the data portion of a write cycle, regardless of the state of OE.

## Burst Write Accesses

The CY7C1354CV25/CY7C1356CV25 has an on-chip burst counter that allows the user the ability to supply a single address and conduct up to four write operations without reasserting the address inputs. ADV/LD must be driven LOW in order to load the initial address, as described in Single Write Accesses. When ADV/LD is driven HIGH on the subsequent clock rise, the chip enables ( $\mathrm{CE}_{1}, \mathrm{CE}_{2}$, and $\overline{\mathrm{CE}}_{3}$ ) and $\overline{\mathrm{WE}}$ inputs are ignored and the burst counter is incremented. The correct $\overline{\mathrm{BW}}$ ( $\overline{\mathrm{BW}}_{\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d}}$ for CY7C1354CV25 and $\overline{B W}_{a, b}$ for CY7C1356CV25) inputs must be driven in each cycle of the burst write in order to write the correct bytes of data.

## Sleep Mode

The ZZ input pin is an asynchronous input. Asserting ZZ places the SRAM in a power conservation "sleep" mode. Two clock cycles are required to enter into or exit from this "sleep" mode. While in this mode, data integrity is guaranteed. Accesses pending when entering the "sleep" mode are not considered valid nor is the completion of the operation guaranteed. The device must be deselected prior to entering the "sleep" mode. $\mathrm{CE}_{1}, \mathrm{CE}_{2}$, and $\overline{C E}_{3}$, must remain inactive for the duration of tZZREC after the ZZ input returns LOW.

## Notes

2. $X=$ "Don't Care", $H=$ Logic HIGH, $L=$ Logic LOW, $\overline{C E}$ stands for all chip enables active. $\bar{B} W x=L$ signifies at least one byte write select is active, $\overline{B W} x=V$ Valid signifies that the desired byte write selects are asserted, see Write Cycle Description table for details.
3. Write is defined by $\overline{\mathrm{WE}}$ and $\overline{\mathrm{BW}}_{\mathrm{X}}$. See Write Cycle Description table for details.
4. When a write cycle is detected, all I/Os are tri-stated, even during byte writes
5. The DQ and DQP pins are controlled by the current cycle and the OE signal.
6. $\overline{\mathrm{CEN}}=\mathrm{H}$ inserts wait states.
7. Device will power-up deselected and the I/Os in a tri-state condition, regardless of $\overline{\mathrm{OE}}$.
8. $\overline{\mathrm{OE}}$ is asynchronous and is not sampled with the clock rise. It is masked internally during write cycles. During a read cycle DQs and $\mathrm{DQP}=\operatorname{tri-state}$ when $\overline{\mathrm{OE}}$ is inactive or when the device is deselected, and DQs = data when OE is active.

## Partial Truth Table for Read/Write

The partial truth table for Read/Write for CY7C1354CV25 follows. ${ }^{[9,10,11,12]}$

| Function (CY7C1354CV25) | $\overline{\text { WE }}$ | $\overline{B W}_{\text {d }}$ | $\overline{\mathrm{BW}}_{\mathrm{c}}$ | $\overline{\mathrm{BW}}_{\mathrm{b}}$ | $\overline{B W}_{\mathrm{a}}$ |

| Write both bytes | L | L | L |

[^0]
## IEEE 1149.1 Serial Boundary Scan (JTAG)

The CY7C1354CV25/CY7C1356CV25 incorporates a serial boundary scan test access port (TAP) in the BGA package only. The TQFP package does not offer this functionality. This part operates in accordance with IEEE Standard 1149.1-1900, but doesn't have the set of functions required for full 1149.1 compliance. These functions from the IEEE specification are excluded because their inclusion places an added delay in the critical speed path of the SRAM. Note the TAP controller functions in a manner that does not conflict with the operation of other devices using 1149.1 fully compliant TAPs. The TAP operates using JEDEC-standard 2.5 V I/O logic levels.
The CY7C1354CV25/CY7C1356CV25 contains a TAP controller, instruction register, boundary scan register, bypass register, and ID register.

## Disabling the JTAG Feature

It is possible to operate the SRAM without using the JTAG feature. To disable the TAP controller, TCK must be tied LOW $\left(\mathrm{V}_{\mathrm{SS}}\right)$ to prevent clocking of the device. TDI and TMS are internally pulled up and may be unconnected. They may alternately be connected to $\mathrm{V}_{\mathrm{DD}}$ through a pull-up resistor. TDO should be left unconnected. Upon power-up, the device will come up in a reset state which will not interfere with the operation of the device.

## Test Access Port (TAP)

## Test Clock (TCK)

The test clock is used only with the TAP controller. All inputs are captured on the rising edge of TCK. All outputs are driven from the falling edge of TCK.

## Test Mode Select (TMS)

The TMS input is used to give commands to the TAP controller and is sampled on the rising edge of TCK. It is allowable to leave this ball unconnected if the TAP is not used.
The ball is pulled up internally, resulting in a logic HIGH level.

## Test Data-In (TDI)

The TDI ball is used to serially input information into the registers and can be connected to the input of any of the registers. The register between TDI and TDO is chosen by the instruction that is loaded into the TAP instruction register. For information on loading the instruction register, see TAP Controller State Diagram on page 14. TDI is internally pulled up and can be unconnected if the TAP is unused in an application. TDI is connected to the most significant bit (MSB) of any register.

## Test Data-Out (TDO)

The TDO output ball is used to serially clock data-out from the registers. The output is active depending upon the current state of the TAP state machine (see Instruction Codes on page 17). The output changes on the falling edge of TCK. TDO is connected to the least significant bit (LSB) of any register.

## Performing a TAP Reset

A RESET is performed by forcing TMS HIGH ( $\mathrm{V}_{\mathrm{DD}}$ ) for five rising edges of TCK. This RESET does not affect the operation of the SRAM and may be performed while the SRAM is operating.

At power-up, the TAP is reset internally to ensure that TDO comes up in a high $Z$ state.

## TAP Registers

Registers are connected between the TDI and TDO balls and allow data to be scanned into and out of the SRAM test circuitry. Only one register can be selected at a time through the instruction register. Data is serially loaded into the TDI ball on the rising edge of TCK. Data is output on the TDO ball on the falling edge of TCK.

## Instruction Register

Three-bit instructions can be serially loaded into the instruction register. This register is loaded when it is placed between the TDI and TDO balls as shown in the TAP Controller Block Diagram on page 15. Upon power-up, the instruction register is loaded with the IDCODE instruction.
It is also loaded with the IDCODE instruction if the controller is placed in a reset state as described in the previous section.
When the TAP controller is in the Capture-IR state, the two least significant bits are loaded with a binary "01" pattern to allow for fault isolation of the board-level serial test data path.

## Bypass Register

To save time when serially shifting data through registers, it is sometimes advantageous to skip certain chips. The bypass register is a single-bit register that can be placed between the TDI and TDO balls. This allows data to be shifted through the SRAM with minimal delay. The bypass register is set LOW ( $\mathrm{V}_{\mathrm{SS}}$ ) when the BYPASS instruction is executed.

## Boundary Scan Register

The boundary scan register is connected to all the input and bidirectional balls on the SRAM.
The boundary scan register is loaded with the contents of the RAM I/O ring when the TAP controller is in the Capture-DR state and is then placed between the TDI and TDO balls when the controller is moved to the Shift-DR state. The EXTEST, SAMPLE/PRELOAD and SAMPLE Z instructions can be used to capture the contents of the I/O ring.
The Boundary Scan Exit Order on page 18 and Boundary Scan Exit Order on page 19 show the order in which the bits are connected. Each bit corresponds to one of the bumps on the SRAM package. The MSB of the register is connected to TDI, and the LSB is connected to TDO.

## Identification (ID) Register

The ID register is loaded with a vendor-specific, 32-bit code during the Capture-DR state when the IDCODE command is loaded in the instruction register. The IDCODE is hardwired into the SRAM and can be shifted out when the TAP controller is in the Shift-DR state. The ID register has a vendor code and other information described in the Identification Register Definitions on page 17.

## TAP Instruction Set

## Overview

Eight different instructions are possible with the three bit instruction register. All combinations are listed in the Instruction Codes table. Three of these instructions are listed as RESERVED and should not be used. The other five instructions are described in detail below.

Instructions are loaded into the TAP controller during the Shift-IR state when the instruction register is placed between TDI and TDO. During this state, instructions are shifted through the instruction register through the TDI and TDO balls. To execute the instruction once it is shifted in, the TAP controller needs to be moved into the Update-IR state.

## IDCODE

The IDCODE instruction causes a vendor-specific, 32-bit code to be loaded into the instruction register. It also places the instruction register between the TDI and TDO balls and allows the IDCODE to be shifted out of the device when the TAP controller enters the Shift-DR state.

The IDCODE instruction is loaded into the instruction register upon power-up or whenever the TAP controller is given a test logic reset state.

## SAMPLE Z

The SAMPLE Z instruction causes the boundary scan register to be connected between the TDI and TDO pins when the TAP controller is in a Shift-DR state. The SAMPLE Z command puts the output bus into a high $Z$ state until the next command is given during the "Update IR" state.

## SAMPLE/PRELOAD

SAMPLE/PRELOAD is a 1149.1 mandatory instruction. When the SAMPLE/PRELOAD instructions are loaded into the instruction register and the TAP controller is in the Capture-DR state, a snapshot of data on the inputs and output pins is captured in the boundary scan register.
The user must be aware that the TAP controller clock can only operate at a frequency up to 20 MHz , while the SRAM clock operates more than an order of magnitude faster. Because there is a large difference in the clock frequencies, it is possible that
during the Capture-DR state, an input or output will undergo a transition. The TAP may then try to capture a signal while in transition (metastable state). This will not harm the device, but there is no guarantee as to the value that will be captured. Repeatable results may not be possible.
To guarantee that the boundary scan register will capture the correct value of a signal, the SRAM signal must be stabilized long enough to meet the TAP controller's capture set-up plus hold times ( $\mathrm{t}_{\mathrm{CS}}$ and $\mathrm{t}_{\mathrm{CH}}$ ). The SRAM clock input might not be captured correctly if there is no way in a design to stop (or slow) the clock during a SAMPLE/PRELOAD instruction. If this is an issue, it is still possible to capture all other signals and simply ignore the value of the CK and CK\# captured in the boundary scan register.
Once the data is captured, it is possible to shift out the data by putting the TAP into the Shift-DR state. This places the boundary scan register between the TDI and TDO pins.
PRELOAD allows an initial data pattern to be placed at the latched parallel outputs of the boundary scan register cells prior to the selection of another boundary scan test operation.
The shifting of data for the SAMPLE and PRELOAD phases can occur concurrently when required-that is, while data captured is shifted out, the preloaded data can be shifted in.

## BYPASS

When the BYPASS instruction is loaded in the instruction register and the TAP is placed in a Shift-DR state, the bypass register is placed between the TDI and TDO pins. The advantage of the BYPASS instruction is that it shortens the boundary scan path when multiple devices are connected together on a board.

## EXTEST

The EXTEST instruction enables the preloaded data to be driven out through the system output pins. This instruction also selects the boundary scan register to be connected for serial access between the TDI and TDO in the shift-DR controller state.

## Reserved

These instructions are not implemented but are reserved for future use. Do not use these instructions.

## TAP Controller State Diagram

The TAP Controller State Diagram follows. ${ }^{[13]}$

| IX | Input Load current | $\mathrm{GND} \leq \mathrm{V}_{\mathrm{IN}} \leq \mathrm{V}_{\mathrm{DDQ}}$ |  | -5 | 5 | $\mu \mathrm{A}$ |

## Identification Register Definitions

| Instruction Field | CY7C1354CV25 | CY7C1356CV25 | Description |
| :--- | :---: | :---: | :--- |
| Revision number (31:29) | 000 | 000 | Reserved for version number. |
| Cypress device ID (28:12) | 01011001000100110 | 01011001000010110 | Reserved for future use. |
| Cypress JEDEC ID (11:1) | 00000110100 | 00000110100 | Allows unique identification of SRAM vendor. |
| ID register presence (0) | 1 | 1 | Indicate the presence of an ID register. |

## Scan Register Sizes

| Register Name | Bit Size (×36) | Bit Size (× 18) |
| :--- | :---: | :---: |
| Instruction | 3 | 3 |
| Bypass | 1 | 1 |
| ID | 32 | 32 |
| Boundary scan order (119-ball BGA package) | 69 | 69 |
| Boundary scan order (165-ball FBGA package) | 69 | 69 |

## Instruction Codes

| Instruction | Code | $\quad$ Description |
| :--- | :---: | :--- |
| EXTEST | 000 | Captures the input/output ring contents. Places the boundary scan register between the TDI <br> and TDO. Forces all SRAM outputs to high Z state. |
| IDCODE | 001 | Loads the ID register with the vendor ID code and places the register between TDI and TDO. <br> This operation does not affect SRAM operation. |
| SAMPLE Z | 010 | Captures the input/output contents. Places the boundary scan register between TDI and TDO. <br> Forces all SRAM output drivers to a high Z state. |
| RESERVED | 011 | Do Not Use: This instruction is reserved for future use. |
| SAMPLE/PRELOAD | 100 | Captures the input/output ring contents. Places the boundary scan register between TDI and <br> TDO. Does not affect the SRAM operation. |
| RESERVED | 101 | Do Not Use: This instruction is reserved for future use. |
| RESERVED | 110 | Do Not Use: This instruction is reserved for future use. |
| BYPASS | 111 | Places the bypass register between TDI and TDO. This operation does not affect SRAM <br> operation. |

## Maximum Ratings

Exceeding maximum ratings may shorten the useful life of the device. User guidelines are not tested.
Storage temperature $\qquad$ $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$
Ambient temperature with power applied $\qquad$ $-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$
Supply voltage on $\mathrm{V}_{\mathrm{DD}}$ relative to GND ....... -0.5 V to +3.6 V
Supply voltage on $\mathrm{V}_{\mathrm{DDQ}}$ relative to $\mathrm{GND} . . . . .-0.5 \mathrm{~V}$ to $+\mathrm{V}_{\mathrm{DD}}$
DC to outputs in tri-state $\qquad$ -0.5 V to $\mathrm{V}_{\mathrm{DDQ}}+0.5 \mathrm{~V}$

DC input voltage ................................. -0.5 V to $\mathrm{V}_{\mathrm{DD}}+0.5 \mathrm{~V}$
Current into outputs (LOW) ........................................ 20 mA
Static discharge voltage
(per MIL-STD-883, method 3015) ......................... > 2001 V
Latch-up current ................................................... > 200 mA
Operating Range

| Range | Ambient Temperature | $\mathbf{V}_{\mathbf{D D}} / \mathbf{V}_{\text {DDQ }}$ |
| :--- | :---: | :---: |
| Commercial | $0{ }^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ | $2.5 \mathrm{~V} \pm 5 \%$ |
| Industrial | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |  |

## Electrical Characteristics

Over the Operating Range

| Parameter ${ }^{[17,18]}$ | Description | Test Conditions |  | Min | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| $\mathrm{t}_{\mathrm{ALH}}$ | ADV/ $\overline{\mathrm{LD}}$ hold after CLK rise | 0.4 | - | 0.5 | - | 0.5 | - | ns |
| $\mathrm{t}_{\text {CEH }}$ | Chip select hold after CLK rise | 0.4 | - | 0.5 | - | 0.5 | - | ns |

## Notes

20. Timing reference level is when $\mathrm{V}_{\mathrm{DDQ}}=2.5 \mathrm{~V}$.
21. Test conditions shown in (a) of Figure 4 on page 21 unless otherwise noted
22. This part has a voltage regulator internally; $t_{\text {power }}$ is the time power needs to be supplied above $V_{D D}$ minimum initially, before a Read or Write operation can be initiated.
23. $t_{C H Z}, t_{C L Z}, t_{E O L Z}$, and $t_{E O H Z}$ are specified with $A C$ test conditions shown in (b) of Figure 4 on page 21 . Transition is measured $\pm 200 \mathrm{mV}$ from steady-state voltage.
24. At any given voltage and temperature, $t_{E O H Z}$ is less than $t_{E O L Z}$ and $t_{C H Z}$ is less than $t_{C L Z}$ to eliminate bus contention between SRAMs when sharing the same data bus. These specifications do not imply a bus contention condition, but reflect parameters guaranteed over worst case user conditions. Device is designed to achieve high Z prior to low $Z$ under the same system conditions
25 . This parameter is sampled and not $100 \%$ tested.

## Switching Waveforms

Figure 5. Read/Write Timing [26, 27, 28]

[^4]Switching Waveforms (continued)
Figure 6. NOP, STALL and DESELECT CYCLES ${ }^{[29,30,31]}$

## Notes

29. For this waveform $Z Z$ is tied LOW.
30. When CE is LOW, CE 1 is LOW, CE 2 is HIGH and $\mathrm{CE}_{3}$ is LOW . When CE is $\mathrm{HIGH}, \mathrm{CE}_{1}$ is HIGH or $\mathrm{CE}_{2}$ is LOW or $\mathrm{CE}_{3}$ is HIGH .
31. The IGNORE CLOCK EDGE or STALL cycle (Clock 3) illustrated $\overline{C E N}$ being used to create a pause. A write is not performed during this cycle.

Switching Waveforms (continued)
Figure 7. ZZ Mode Timing ${ }^{[32,33]}$

V/A DON'T CARE

Notes
32. Device must be deselected when entering $Z Z$ mode. See cycle description table for all possible signal conditions to deselect the device. 33. I/Os are in high $Z$ when exiting $Z Z$ sleep mode

## Ordering Information

Cypress offers other versions of this type of product in many different configurations and features. The below table contains only the list of parts that are currently available.For a complete listing of all options, visit the Cypress website at www.cypress.com and refer to the product summary page at http://www.cypress.com/products or contact your local sales representative.
Cypress maintains a worldwide network of offices, solution centers, manufacturer's representatives and distributors. To find the office closest to you, visit us at http://www.cypress.com/go/datasheet/offices.

| Speed <br> $(\mathbf{M H z})$ | Ordering Code | Package <br> Diagram | Part and Package Type | Operating <br> Range |
| :---: | :--- | :--- | :--- | :--- |
| 166 | CY7C1354CV25-166AXC | $51-85050$ | $100-$ pin TQFP $(14 \times 20 \times 1.4 \mathrm{~mm})$ Pb-free | Commercial |

|  | CY7C1354CV25-166BZC | $51-85180$ | $165-$ ball FBGA $(13 \times 15 \times 1.4 \mathrm{~mm})$ | Commercial |
| 200 | CY7C1354CV25-200AXC | $51-85050$ | $100-$ pin TQFP $(14 \times 20 \times 1.4 \mathrm{~mm})$ Pb-free |  |

## Ordering Code Definitions

## Package Diagrams

Figure 8. $100-$ pin TQFP ( $14 \times 20 \times 1.4 \mathrm{~mm}$ ) A100RA Package Outline, $51-85050$

Package Diagrams (continued)
Figure 9. 119-ball PBGA ( $14 \times 22 \times 2.4 \mathrm{~mm}$ ) BG119 Package Outline, 51-85115

NOTE:
Package Weight: See Cypress Package Material Declaration Datasheet (PMDD) posted on the Cypress web.

## Package Diagrams (continued)

Figure 10. 165-ball FBGA ( $13 \times 15 \times 1.4 \mathrm{~mm}$ ) BB165D/BW165D ( 0.5 Ball Diameter) Package Outline, 51-85180

notes :
SDLDER PAD TYPE : NDN-SDLDER MASK DEFINED (NSMD)
JEDEC REFERENCE: MD-216/ ISSUE E
PACKAGE CDDE: BBOAC/BWOAC
PACKAGE WEIGHT : SEE CYPRESS PACKAGE MATERIAL DECLARATIUN DATASHEET (PMDD) PISTED UN THE CYPRESS WEB.

Acronyms

| Acronym | Description |
| :--- | :--- |
| BGA | ball grid array |
| $\overline{\text { CE }}$ | chip enable |
| $\overline{\text { CEN }}$ | clock enable |
| CMOS | complementary metal oxide semiconductor |
| EIA | electronic industries alliance |
| FBGA | fine-pitch ball grid array |
| I/O | input/output |
| JEDEC | joint electron devices engineering council |
| JTAG | joint test action group |
| LSB | least significant bit |
| MSB | most significant bit |
| NoBL | No Bus Latency |
| $\overline{\text { OE }}$ | output enable |
| SRAM | static random access memory |
| TAP | test access port |
| TCK | test clock |
| TDI | test data-in |
| TDO | test data-out |
| TMS | test mode select |
| TQFP | thin quad flat pack |
| TTL | transistor-transistor logic |
| $\overline{\text { WE }}$ | write enable |

## Document Conventions

## Units of Measure

| Symbol | Unit of Measure |
| :--- | :--- |
| ${ }^{\circ} \mathrm{C}$ | degree Celsius |
| MHz | megahertz |
| $\mu \mathrm{A}$ | microampere |
| mA | milliampere |
| mm | millimeter |
| ms | millisecond |
| mV | millivolt |
| ns | nanosecond |
| $\Omega$ | ohm |
| $\%$ | percent |
| pF | picofarad |
| V | volt |
| W | watt |

## Document History Page

Document Title: CY7C1354CV25/CY7C1356CV25, 9-Mbit ( $256 \mathrm{~K} \times 36 / 512 \mathrm{~K} \times 18$ ) Pipelined SRAM with NoBL ${ }^{\text {TM }}$ Architecture Document Number: 38-05537

| Rev. | ECN No. | Issue Date | Orig. of Change | Description of Change |
| :---: | :---: | :---: | :---: | :---: |
| ** | 242032 | See ECN | RKF | New data sheet |
| *A | 278969 | See ECN | RKF | Changed Boundary Scan order to match the B Rev of these devices |
| *B | 284929 | See ECN | RKF / VBL | Included DC Characteristics Table <br> Changed ISB1 and ISB3 from DC Characteristic table as follows: <br> ISB1: 225 MHz -> $130 \mathrm{~mA}, 200 \mathrm{MHz}$-> $120 \mathrm{~mA}, 167 \mathrm{MHz}$-> 110 mA <br> ISB3: 225 MHz -> $120 \mathrm{~mA}, 200 \mathrm{MHz}$-> $110 \mathrm{~mA}, 167 \mathrm{MHz}$-> 100 mA Changed IDDZZ to 50 mA . <br> Added BG and BZ pkg lead-free part numbers to ordering info section. |
| *C | 323636 | See ECN | PCI | Changed frequency of 225 MHz into 250 MHz <br> Added $\mathrm{t}_{\mathrm{CYC}}$ of 4.0 ns for 250 MHz <br> Changed $\Theta_{J A}$ and $\Theta_{J C}$ for TQFP Package from 25 and $9{ }^{\circ} \mathrm{C} / \mathrm{W}$ to 29.41 and <br> $6.13^{\circ} \mathrm{C} / \mathrm{W}$ respectively <br> Changed $\Theta_{\mathrm{JA}}$ and $\Theta_{\mathrm{JC}}$ for BGA Package from 25 and $6^{\circ} \mathrm{C} / \mathrm{W}$ to 34.1 and $14.0^{\circ} \mathrm{C} / \mathrm{W}$ respectively <br> Changed $\Theta_{\mathrm{JA}}$ and $\Theta_{\mathrm{JC}}$ for FBGA Package from 27 and $6^{\circ} \mathrm{C} / \mathrm{W}$ to 16.8 and $3.0^{\circ} \mathrm{C} / \mathrm{W}$ respectively <br> Modified address expansion as per JEDEC Standard <br> Removed comment of Lead-free BG and BZ packages availability |
| *D | 332879 | See ECN | PCI | Unshaded 200 and 166 MHz speed bin in the AC/DC Table and Selection Guide Added Address Expansion pins in the Pin Definition Table Removed description of Extest Output Bus Tri-state on page \# 11 Modified $\mathrm{V}_{\mathrm{OL}}, \mathrm{V}_{\mathrm{OH}}$ test conditions Updated Ordering Information Table |
| *E | 357258 | See ECN | PCI | Changed from Preliminary to Final Changed $\mathrm{I}_{\mathrm{SB} 2}$ from 35 to 40 mA <br> Removed Shading on 250 MHz Speed Bin in Selection Guide and AC/DC Table Updated Ordering Information Table |
| *F | 377095 | See ECN | PCI | Modified test condition in note\# 15 from $\mathrm{V}_{\mathrm{DDQ}}<\mathrm{V}_{\mathrm{DD}}$ to $\mathrm{V}_{\mathrm{DDQ}} \leq \mathrm{V}_{\mathrm{DD}}$ |
| *G | 408298 | See ECN | RXU | Changed address of Cypress Semiconductor Corporation on Page\# 1 from "3901 North First Street" to "198 Champion Court" Changed three-state to tri-state. <br> Modified "Input Load" to "Input Leakage Current except ZZ and MODE" in the Electrical Characteristics Table. <br> Replaced Package Name column with Package Diagram in the Ordering Information table. Updated the Ordering Information Table. |
| *H | 501793 | See ECN | VKN | Added the Maximum Rating for Supply Voltage on $V_{\text {DDQ }}$ Relative to GND Changed $\mathrm{t}_{\mathrm{TH}}, \mathrm{t}_{\mathrm{TL}}$ from 25 ns to 20 ns and $\mathrm{t}_{\mathrm{TDOV}}$ from 5 ns to 10 ns in TAP AC Switching Characteristics table. Updated the Ordering Information table. |
| *1 | 2898958 | 03/25/10 | NJY | Removed inactive parts from the ordering information table. Updated package diagrams. |
| *J | 3033272 | 09/19/2010 | NJY | Added Ordering Code Definitions Added Acronyms and Units of Measure Minor edits and updated in new template |
| *K | 3052726 | 10/08/10 | NJY | Removed pruned part CY7C1356CV25-200AXC from the ordering information table. |
| *L | 3385314 | 09/29/2011 | PRIT | Updated Package Diagrams. |

Cypress does not authorize its products for use as critical components in life-support systems where a malfunction or failure may reasonably be expected to result in significant injury to the user. The inclusion of Cypress' product in a life-support systems application implies that the manufacturer assumes all risk of such use and in doing so indemnifies Cypress against all charges.

Use may be limited by and subject to the applicable Cypress software license agreement.

[^0]:    Notes
    9. $X=$ "Don't Care", H = Logic HIGH, $L=$ Logic LOW, $\overline{C E}$ stands for all chip enables active. $\overline{B W} x=L$ signifies at least one byte write select is active, $\overline{B W} x=$ valid signifies that the desired byte write selects are asserted, see Write Cycle Description table for details.
    10. Write is defined by $\overline{\mathrm{WE}}$ and $\overline{\mathrm{BW}}_{\mathrm{X}}$. See Write Cycle Description table for details.
    11. When a write cycle is detected, all I/Os are tri-stated, even during byte writes.
    12. Table only lists a partial listing of the byte write combinations. Any combination of $\overline{\mathrm{BW}}_{\mathrm{X}}$ is valid. Appropriate write will be done based on which byte write is active.

[^1]:    Notes
    14. $\mathrm{t}_{\mathrm{CS}}$ and $\mathrm{t}_{\mathrm{CH}}$ refer to the set-up and hold time requirements of latching data from the boundary scan register.
    15. Test conditions are specified using the load in TAP AC test Conditions. $\mathrm{t}_{\mathrm{R}} / \mathrm{t}_{\mathrm{F}}=1 \mathrm{~ns}$.

[^2]:    Note
    16. All voltages referenced to $\mathrm{V}_{\mathrm{SS}}$ (GND).

[^3]:    Notes
    17. Overshoot: $\mathrm{V}_{\mathrm{IH}(\mathrm{AC})}<\mathrm{V}_{\mathrm{DD}}+1.5 \mathrm{~V}$ (Pulse width less than $\left.\mathrm{t}_{\mathrm{CYC}} / 2\right)$, undershoot: $\mathrm{V}_{\mathrm{IL}(\mathrm{AC})}>-2 \mathrm{~V}$ (Pulse width less than $\mathrm{t}_{\mathrm{CYC}} / 2$ ) 18. $T_{\text {Power-up }}$ : Assumes a linear ramp from 0 V to $\mathrm{V}_{\mathrm{DD}(\mathrm{min})}$ within 200 ms . During this time $\mathrm{V}_{\mathrm{IH}}<\mathrm{V}_{\mathrm{DD}}$ and $\mathrm{V}_{\mathrm{DDQ}} \leq \mathrm{V}_{\mathrm{DD}}$.

[^4]:    Notes
    26. For this waveform $Z Z$ is tied LOW.
    27. When $\overline{\mathrm{CE}}$ is LOW, $\overline{\mathrm{CE}}_{1}$ is LOW, $\mathrm{CE}_{2}$ is HIGH and $\overline{\mathrm{CE}}_{3}$ is LOW . When $\overline{\mathrm{CE}}$ is $\mathrm{HIGH}, \overline{\mathrm{CE}}_{1}$ is HIGH or $\mathrm{CE}_{2}$ is LOW or $\overline{\mathrm{CE}}_{3}$ is HIGH.
    28. Order of the Burst sequence is determined by the status of the MODE ( $0=$ Linear, $1=$ Interleaved). Burst operations are optional.
