Preamplifier + Power Amplifier for 3V Headphone Stereos

Overview

The LA4581MB is an auto reverse-supported preamplifier + power amplifier IC that is intended for use in 3V headphone stereos.

Features

- Preamplifier muting and preamplifier output on/off can be implemented with one pin. This IC can easily be used to construct a set with a radio.
- The power amplifier needs no input/output coupling capacitor.
- A high-frequency cut capacitor is connected to the preamplifier input pin and the power amplifier input pin. (Anti-buzz provision)
- Because V_{ref} AMP ($r_0 = 10 \Omega$) is built in, the virtual grounding impedance is about 10Ω . This eliminates the need for a large capacitor.
- 8Ω speaker drivable.

Pin No.	Pin Function
1	PRE GND
2	PRE IN1R 1.8 V • Turns ON when pin 17 is grounded. • A bias resistor (2.2 kΩ) must be connected between pin 2 and pin 24 (V _{ref}) when no head is in use.
3	PRE IN1F 1.8 V • Turns ON when pin 17 is floating. • A bias resistor (2.2 kΩ) must be connected between pin 3 and pin 24 (V _{ref}) when no head is in use.
4	PRE NF1 1.8 V
5	PRE OUT1 1.8 V • Like pin 6, 10 kΩ load drivable.
6	SW OUT1 1.8V • Provides PRE AMP1 output when pin 8 is floating (PRE MUTE OFF)(equivalent to pin 5). • Disconnects from PRE AMP1 and sets R _{IN} ≥ 500 kΩ when pin 8 is at V _{CC} (PRE MUTE ON).
7	POWER IN1 1.8V • Input resistance R _{IN} = 30 kΩ

IC Usage Notes

- The power amplifier outputs and the common amplifier output are connected through resistors of about 60 Ω. The resistors are for common amplifier oscillation blocking.

- The preamplifier muting function isolates the preamplifier outputs from SW OUT. The preamplifier is on even when the preamplifier muting is on.
- If transient noise is noticeable when the power supply is turned off, add the external circuit described below. Transient noise when the power is turned off can be improved by rapidly applying the power amplifier muting.

Unit (resistance: Ω, capacitance: F)

However, the standby current I_{ST} flows even when the power switch is off
 $I_{ST} = (V_{CC} - V_{BE})/600 \text{ k}\Omega$
 When $V_{CC} = 3.0 \text{ V}$
 $I_{ST} = (3.0 - 0.6)/600 \text{ k}\Omega \approx 4 \mu\text{A}$
