MAXIM

µP Power-Supply Monitor with Reset

MAX7705

_____General Description

In applications with microprocessors (µPs) that have a $\overline{RESET}$ input, the MAX7705 is functionally and socket compatible with the TL7705, but requires **no external components.** It provides power-supply glitch immunity and a guaranteed power-up reset delay, while typically consuming 1/27th the power from a +5V supply.

The MAX7705 monitors the power supply in µP and digital systems. The $\overline{RESET}$ output is valid for V_{CC} down to 1V. The device offers excellent circuit reliability and low cost by eliminating external components and adjustments.

A system reset is provided during power-up, power-down, and brownout conditions. When V_{CC} is below the reset threshold, $\overline{RESET}$ is low and holds the µP in reset. $\overline{RESET}$ will go high 280ms after V_{CC} rises above the reset threshold. The MAX7705 is available in 8-pin DIP and SO packages.

FEATURE	MAX7705	TL7705
No. of External Components Required	**0**	3
Operating Supply Current +5V	**65µA**	1.8mA
Operating Supply Current +3V	**35µA**	1.8mA
Power-Supply Glitch Immunity	**Yes**	No
Guaranteed Minimum Reset Delay	**Yes**	No

_____Applications

Minimum Component Count, Low-Cost Processor Systems
_____Pin Configuration
_____Features

♦ **No External Components**

♦ **Low Cost**

♦ **Precise Reset Threshold**

♦ **280ms Power-On Reset Delay**

♦ **8-Pin DIP and SO Packages**

_____Ordering Information

PART	TEMP. RANGE	PIN-PACKAGE
MAX7705CPA	0°C to +70°C	8 Plastic DIP
MAX7705CSA	0°C to +70°C	8 SO
MAX7705C/D	0°C to +70°C	Dice*
MAX7705EPA	-40°C to +85°C	8 Plastic DIP
MAX7705ESA	-40°C to +85°C	8 SO

* Contact factory for dice specifications.

_____Typical Operating Circuit

* THE MAX7705 ELIMINATES THREE EXTERNAL COMPONENTS REQUIRED BY THE TL7705.

µP Power-Supply Monitor with Reset

ABSOLUTE MAXIMUM RATINGS

Terminal Voltage (with respect to GND)
V_{CC} ....-0.3V to 6.0V
RESET...-0.3V to (V_{CC} + 0.3V)
Input Current, V_{CC} 20mA
Output Current, RESET 20mA
Rate-of-Rise, V_{CC} 100V/µs
Continuous Power Disipation (T_A = +70°C)
Plastic DIP (derate 9.09mW/°C above +70°C) 727mW
SO (derate 5.88mW/°C above +70°C).........................471mW

Operating Temperature Ranges:
MAX7705C_ _ ....0°C to +70°C
MAX7705E_ _ ....-40°C to +85°C
Storage Temperature Range ....-65°C to +160°C
Lead Temperature (soldering, 10sec) ....+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V_{CC} = full range, T_A = T_{MIN} to T_{MAX}, unless otherwise noted.)

PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS
V_{CC} Range	MAX7705C	1.0		5.5	V
	MAX7705E	1.2		5.5	
Supply Current	MAX7705C, V_{CC} < 5.5V		65	150	µA
	MAX7705E, V_{CC} < 5.5V		65	200	
RESET Threshold		4.50	4.65	4.75	V
V_{CC} to RESET Delay	V_{CC} = reset threshold max to reset threshold min		20		µs
Reset Active Timeout Period	V_{CC} = reset threshold max, V_{CC} rising	140	280	560	ms
RESET Output Voltage	I_{SINK} = 3.2mA, V_{CC} = reset threshold min			0.4	V
	I_{SINK} = 50µA, V_{CC} ≥ 1.0V, MAX7705C			0.3	
	I_{SINK} = 100µA, V_{CC} ≥ 1.2V, MAX7705E			0.4	
	I_{SOURCE} = 800µA, V_{CC} ≥ reset threshold max	V_{CC} - 1.5

Figure 1. Maximum Transient Duration without Causing a Reset Pulse vs. Reset Comparator Overdrive

_____Applications Information

Replacing the TL7705 with a MAX7705 in an Existing Design

The MAX7705 has only three active pins: V_{CC}, GND, and $\overline{RESET}$. When using a TL7705 with a µP that has a $\overline{RESET}$ input, simply plug the MAX7705 into the same socket and omit the $\overline{RESET}$ pull-up resistor, reset timing capacitor, and reference bypass capacitor (see the _Typical Operating Circuit_).

The MAX7705 monitors the V_{CC} voltage and asserts reset whenever V_{CC} falls below the reset threshold. The reset power-up delay is created by an internal fixed oscillator. This delay is 100% tested and guaranteed over the full temperature range. The $\overline{RESET}$ output both sources and sinks current (see $\overline{RESET}$ Output Voltage in the _Electrical Characteristics_).

Negative-Going V$_{CC}$ Transients

The MAX7705 asserts $\overline{RESET}$ during power-up, power-down, and brownout conditions. However, it is relatively immune to short-duration negative-going V_{CC} transients (glitches).

Figure 1 shows typical transient duration vs. reset comparator overdrive for which the MAX7705 does **not** generate a reset pulse. The graph was generated using a fast-edge, negative-going pulse applied to V_{CC}, starting 1.5V above the actual reset threshold and ending below the reset threshold by the magnitude indicated (reset comparator overdrive). It indicates the typical maxi-

mum pulse width a negative-going V_{CC} transient may have without causing a reset pulse to be issued. As the magnitude of the transient increases (goes farther below the reset threshold), the maximum allowable pulse width decreases. Typically, a V_{CC} transient that goes 100mV below the reset threshold and lasts 40µs or less will not cause a reset pulse to be issued.

A 0.1µF bypass capacitor mounted as close as possible to pin 2 (V_{CC}) provides additional transient immunity.

Ensuring a Valid $\overline{RESET}$ Output Down to V$_{CC}$ = 0V

When V_{CC} falls below 1V, the MAX7705 $\overline{RESET}$ output no longer sinks current; it becomes high impedance. Therefore, high-impedance CMOS logic inputs connected to the $\overline{RESET}$ output can drift to indeterminate voltages. In most applications this presents no problem, as µP and other circuitry is generally inoperative with V_{CC} below 1V. In applications where the $\overline{RESET}$ output must be valid down to 0V, adding a pull-down resistor to the $\overline{RESET}$ pin (as shown in Figure 2) will cause any stray leakage currents to flow to ground, holding $\overline{RESET}$ low. The resistance value of R1 is not critical. It should be about 100kΩ, which is large enough not to load $\overline{RESET}$ and small enough to pull $\overline{RESET}$ to ground.
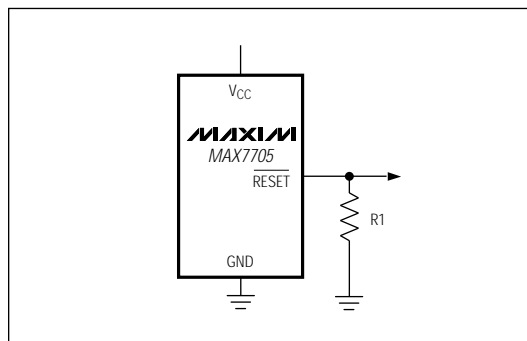

Figure 2. $\overline{RESET}$ Valid to V_{CC} = Ground Circuit

MAX7705

Interfacing to µPs with Bidirectional Reset Inputs

µPs with bidirectional reset pins, such as Motorola's 68HC11 series, can contend with the MAX7705 reset output. If, for example, the MAX7705 $\overline{\text{RESET}}$ output is asserted high and the µP wants to pull it low, an indeterminate logic level may result. To correct this, connect a 4.7kΩ resistor between the MAX7705 $\overline{\text{RESET}}$ output and the µP reset I/O, as in Figure 3. Buffer the $\overline{\text{RESET}}$ signal to other system components.
