Description

The GD75189/A is monolithic quadruple line receivers designed to satisfy the requirements of the standard interface between data terminal equipment and data communication equipment as defined by EIA standard RS-232C. A separate response control terminal is provided for each receiver. A resistor or a resistor and bias voltage can be connected between this terminal and ground to shift the input threshold voltage levels. An external capacitor can be connected from this terminal to ground to provide input noise filtering.

- NOTES: A. The pulse generator has the following characteristics: $Z_{OUT} = 50\Omega$, $I_s = 500\text{ns}$.
 B. C_L includes probe and jig capacitance.
 C. All diodes are 1N3064 or equivalent.

Arrows indicate actual direction of current flow. Current into a terminal is a positive value.

Typical Characteristics

NOTE A: This figure shows the maximum amplitude of a positive-going pulse that, starting from zero volts, will not cause a change of the output level.
