

To our customers,

Old Company Name in Catalogs and Other Documents

On April 1st, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: <http://www.renesas.com>

April 1st, 2010
Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation (<http://www.renesas.com>)

Send any inquiries to <http://www.renesas.com/inquiry>.

Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: “Standard”, “High Quality”, and “Specific”. The recommended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as “Specific” without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as “Specific” or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is “Standard” unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
 - “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
 - “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.
 - “Specific”: Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

4 BIT SINGLE-CHIP MICROCOMPUTER

The μ PD75036 is a 75X series 4-bit single-chip microcomputer.

The μ PD75036 is an expanded version of the μ PD75028. It has ROM and RAM with a larger capacity.

The minimum instruction execution time of the μ PD75036 is 0.95 μ s. In addition to this high-speed capability, it contains an A/D converter and furnishes high-performance functions such as the serial bus interface (SBI) function that follows the NEC standard format, providing powerful features and high cost performance.

A built-in PROM product, μ PD75P036, is also available. The μ PD75P036 is suitable for small-scale production or experimental production in system development.

The following user's manual describes the details of functions. Be sure to read it before design.

μ PD75028 User's Manual: IEU-694

FEATURES

- Variable instruction execution time advantageous to high-speed operation and power-saving:
 - 0.95 μ s, 1.91 μ s, or 15.3 μ s (at 4.19 MHz when the main system selected)
 - 122 μ s (at 32.768 kHz when the subsystem clock selected)
- Program memory (ROM) capacity: 16256 \times 8 bits
- Data memory (RAM) capacity: 1024 \times 4 bits
- Built-in A/D converter (8-bit resolution, successive approximation): 8 channels
- Powerful timer function: 4 channels
 - Usable for 16-bit integral A/D conversion and PWM output
- Built-in NEC standard serial bus interface (SBI)
- Very low-power clock operation allowed (5 μ A TYP. at 3 V)

APPLICATIONS

Electric household appliances, air cooling/heating apparatus, cameras, and electronic measuring instruments

ORDERING INFORMATION

Part number	Package	Quality grade
μ PD75036CW-xxx	64-pin plastic shrink DIP (750 mil)	Standard
μ PD75036GC-xxx-AB8	64-pin plastic QFP (\square 14 mm)	Standard

Remark xxx is a mask ROM code number.

Please refer to "Quality Grades on NEC Semiconductor Devices" (Document number IEI-1209) published by NEC Corporation to know the specification of quality grade on the devices and its recommended applications.

The information in this document is subject to change without notice.

<p>Type B-C</p>  <p>P.U.R.: Pull-Up Resistor</p>	<p>Type E-D</p>  <p>P.D.R.: Pull-Down Resistor</p>

(2/3)

(3/3)

3.4 MASK OPTION SELECTION

The following mask options are available for selection for each pin.

Pin name	Mask option	
P40 - P43, P50 - P53, P100-P103	① Pull-up resistor provided (specifiable bit by bit)	② Pull-up resistor not provided (specifiable bit by bit)
XT1, XT2	① Feedback resistor provided (if a subsystem clock is used)	② Feedback resistor not provided (if a subsystem clock is not used)

★ 3.5 CONNECTION OF UNUSED PINS

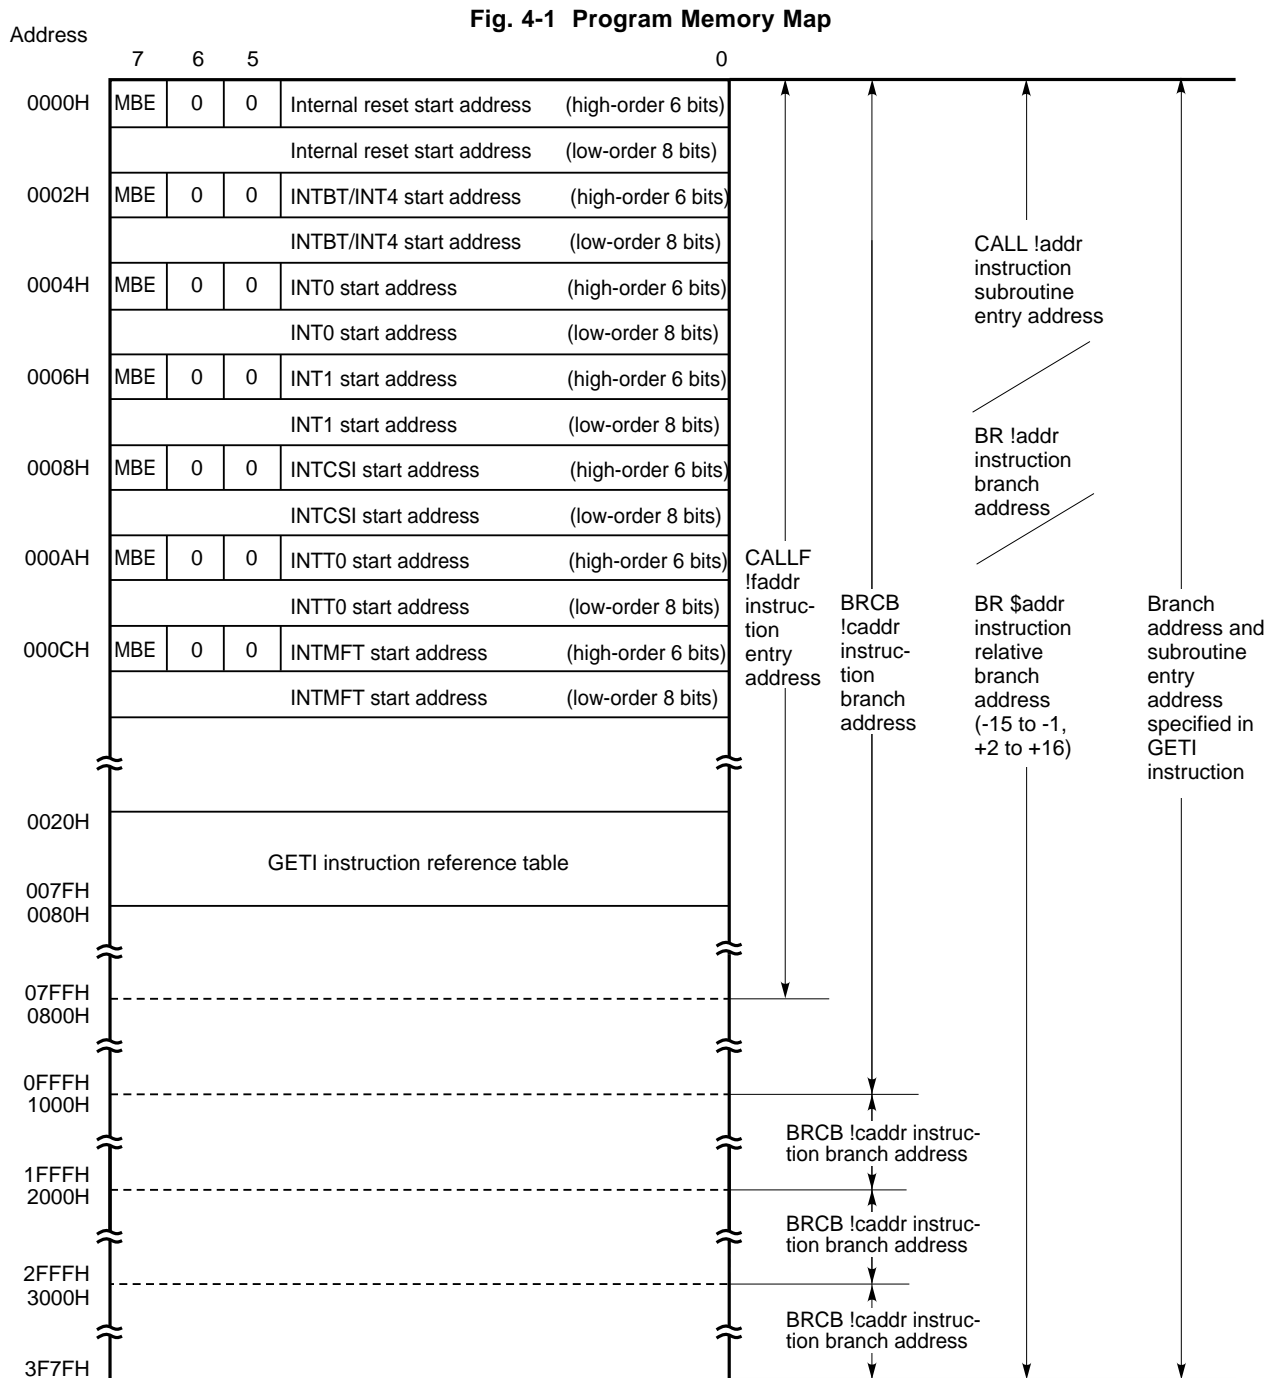

Pin	Recommended connection
P00/INT4	To be connected to V _{SS}
P01/ $\overline{\text{SCK}}$	To be connected to V _{SS} or V _{DD}
P02/SO/SB0	
P03/SI/SB1	
P10/INT0-P12/INT2	To be connected to V _{SS}
P13/TI0	
P20/PTO0	Input state : To be connected to V _{SS} or V _{DD} Output state: To be open
P21/PPO	
P22/PCL	
P23/BUZ	
P30-P33	
P40-P43	
P50-P53	
P60/KR0-P63/KR3	
P70/KR4-P73/KR7	
P80-P83	
P90-P93	
P100/ $\overline{\text{MAR}}$	
P101/ $\overline{\text{MAI}}$	
P102/ $\overline{\text{MAZ}}$	
P103/ $\overline{\text{MAT}}$	
P110/AN0-P113/AN3	To be connected to V _{SS} or V _{DD}
AN4-AN7	
AV _{REF+}	To be connected to V _{SS}
AV _{REF-}	
AV _{SS}	
AV _{DD}	To be connected to V _{DD}
XT1	To be connected to V _{SS} or V _{DD}
XT2	To be open
IC	To be directly connected to V _{DD}

4. ARCHITECTURE AND MEMORY MAP OF THE μPD75036

The μPD75036 has two architectural features:

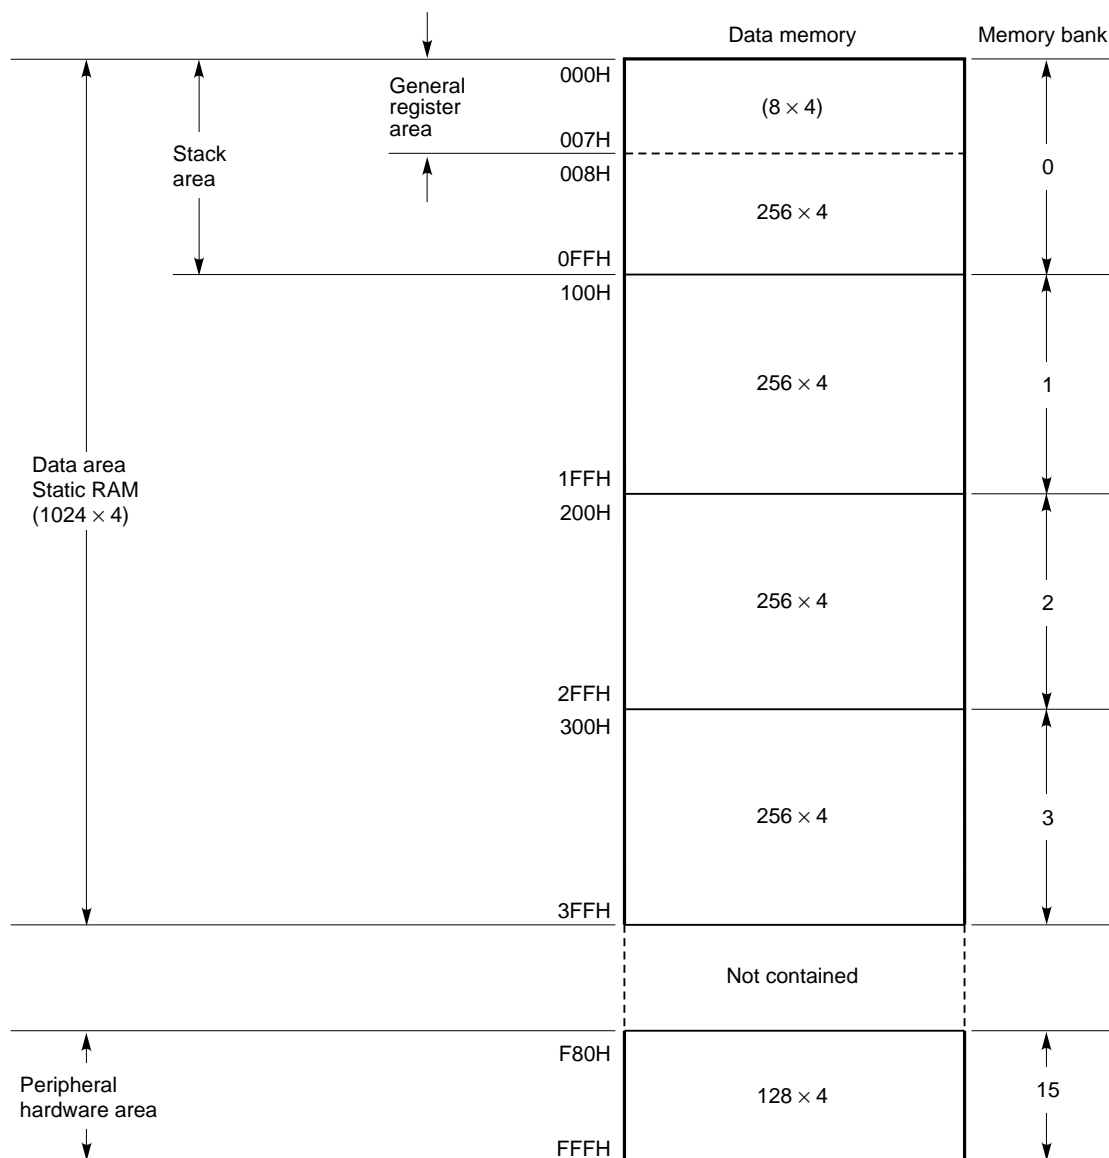

- Bank configuration of data memory: Static RAM (1024 words × 4 bits)
Peripheral hardware (128 × 4 bits)
- Memory mapped I/O

Fig. 4-1 and 4-2 show the memory maps for the μPD75036.

Remark In addition to the above, the BR PCDE and BR PCXA instructions can cause a branch to an address with only the low-order 8 bits of the PC changed.

Fig. 4-2 Data Memory Map

5. PERIPHERAL HARDWARE FUNCTIONS

5.1 PORTS

The μPD75036 has the following three types of I/O port:

- 12 CMOS input ports (Ports 0, 1, and 11)
- 24 CMOS I/O ports (Ports 2, 3, 6, 7, 8, and 9)
- 12 N-ch open-drain I/O ports (Ports 4, 5, and 10)

Total: 48 ports

Table 5-1 Functions of Ports

Port (symbol)	Function	Operation and feature	Remarks
PORT0 PORT1	4-bit input	Allows input and test at any time regardless of the operation modes of dual function pins.	Also used as SO/SB0, SI/SB1, SCK, INT0-INT2, INT4, and TI0 pins.
PORT3 ^{Note} PORT6	4-bit I/O	Allows input or output mode setting in units of one bit.	Port 6 is also used as KR0-KR3 pins.
PORT2 PORT7		Allows input or output mode setting in units of four bits. Ports 6 and 7 make a pair, allowing data I/O in units of eight bits.	Port 2 is also used as PTO0, PPO, PCL, and BUZ pins. Also used as KR4-KR7 pins.
PORT4 ^{Note} PORT5 ^{Note} PORT10 ^{Note}	4-bit I/O (N-ch open-drain, withstand voltage: 10 V)	Allows input or output mode setting in units of four bits. Ports 4 and 5 make a pair, allowing data I/O in units of eight bits.	Use of an internal pull-up resistor can be mask-programmed in units of one bit. Port 10 is also used as MAR, MAI, MAZ, and MAT pins.
PORT8 PORT9	4-bit I/O	Allows input or output mode setting in units of four bits.	
PORT11	4-bit input	Port for 4-bit input	Port 11 is also used as AN0-AN3 pins.

Note Ports 3, 4, 5 and 10 can directly drive an LED.

5.2 CLOCK GENERATOR

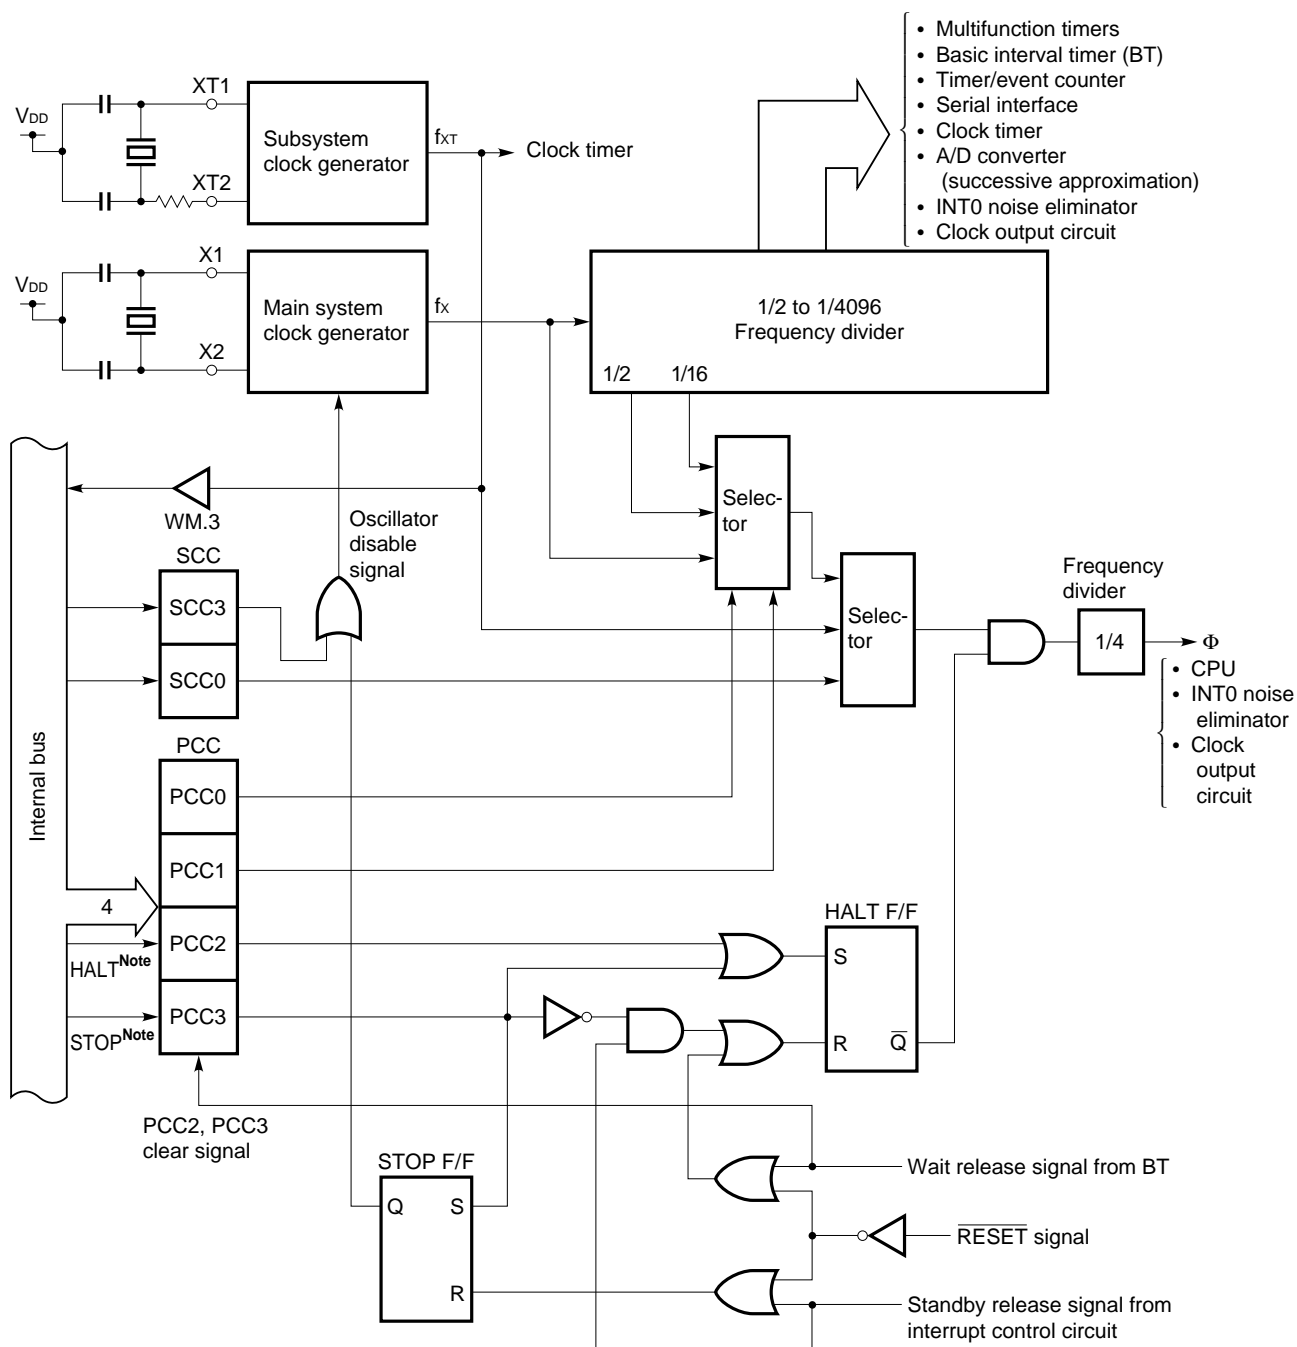

Operation of the clock generator is specified by the processor clock control register (PCC) and system clock control register (SCC).

The main system clock or subsystem clock can be selected.

The instruction execution time is variable.

- 0.95 μs, 1.91 μs, 15.3 μs (main system clock: 4.19 MHz)
- 122 μs (subsystem clock: 32.768 kHz)

Fig. 5-1 Block Diagram of the Clock Generator

Note Instruction execution

Remarks 1. f_x : Main system clock frequency

2. f_{xt} : Subsystem clock frequency

3. Φ = CPU clock

4. PCC: Processor clock control register

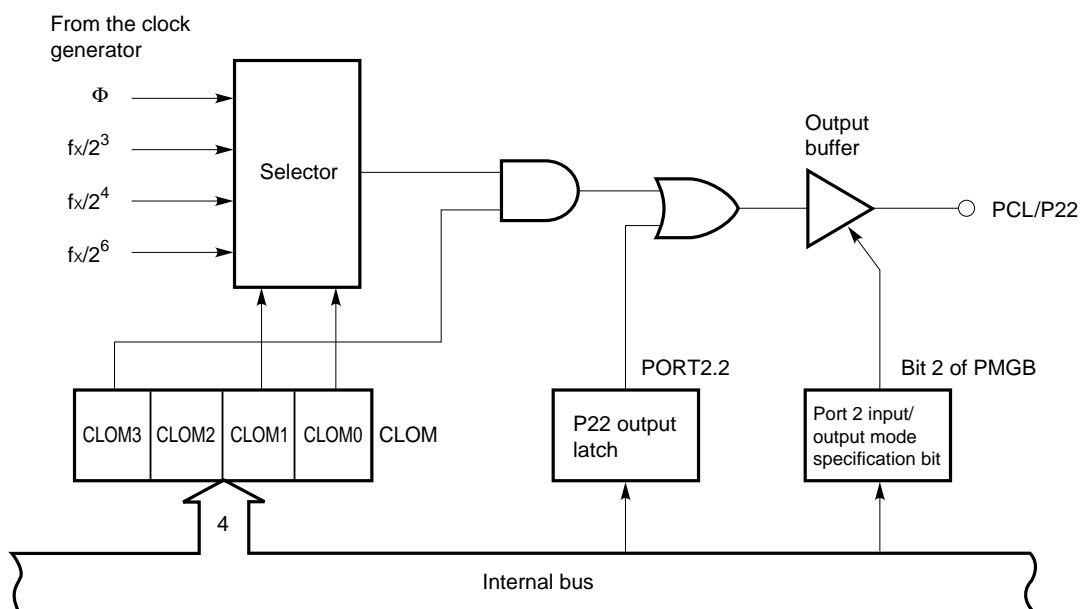

5. SCC: System clock control register

6. One clock cycle (t_{cy}) of the CPU clock (Φ) is equal to one machine cycle of an instruction. See **Chapter 10** for details of t_{cy} .

5.3 CLOCK OUTPUT CIRCUIT

The clock output circuit outputs a clock pulse signal on the P22/PCL pin for remote control or for supplying clock pulses to a peripheral LSI device.

Fig. 5-2 Configuration of the Clock Output Circuit

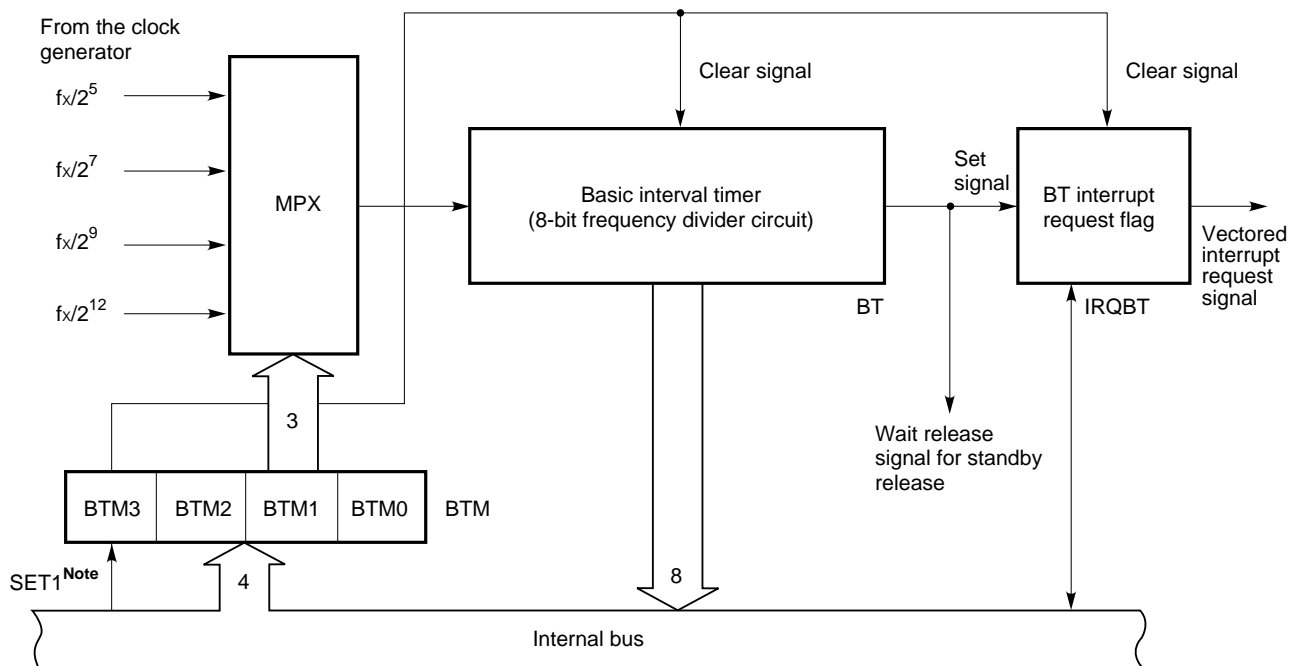

Remark The clock output circuit is designed so that pulses with short widths do not appear in enabling or disabling clock output.

5.4 BASIC INTERVAL TIMER

The basic interval timer provides the following functions:

- Interval timer operation that generates a reference time interrupt
- Application of watchdog timer for detecting program crashes
- Selection of a wait time for releasing the standby mode, and counting
- Reading the count value

Fig. 5-3 Configuration of the Basic Interval Timer

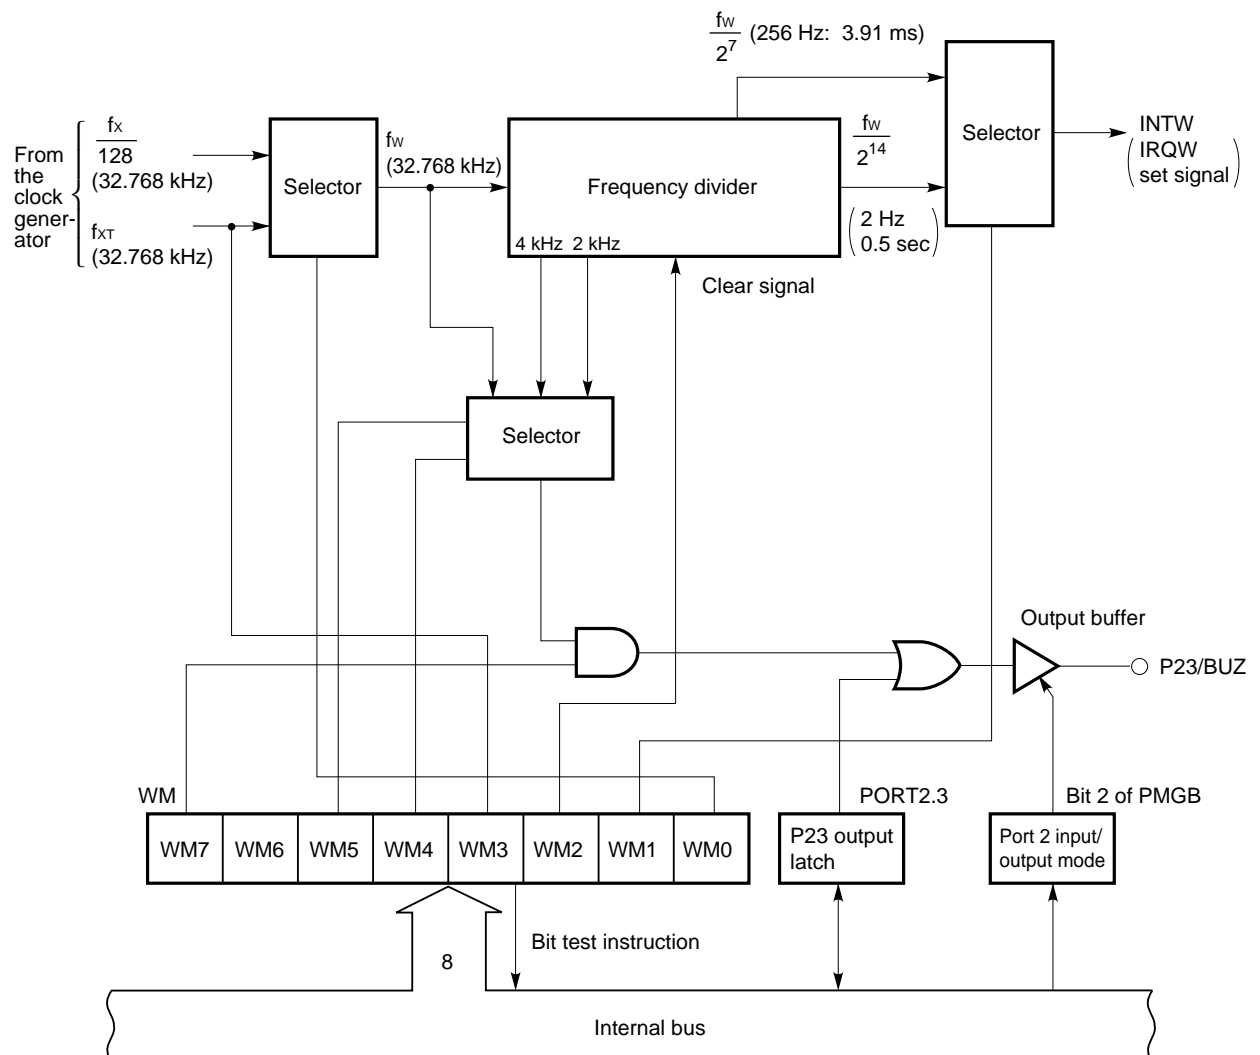

Note Instruction execution

5.5 CLOCK TIMER

The μPD75036 contains one channel for a clock timer. The clock timer provides the following functions:

- The clock timer sets the test flag (IRQW) every 0.5 seconds.
The standby mode can be released with IRQW.
- Either the main system clock or subsystem clock can produce 0.5-second intervals.
- The fast-forward mode produces an interval 128 times faster (3.91 ms), which is useful for program debugging and testing.
- An arbitrary frequency (2.048, 4.096, or 32.768 kHz) can be output to the P23/BUZ pin, so that it can be used for sounding the buzzer and system clock frequency trimming.
- The frequency divider can be cleared, so the clock can start from zero seconds.

Fig. 5-4 Block Diagram of the Clock Timer

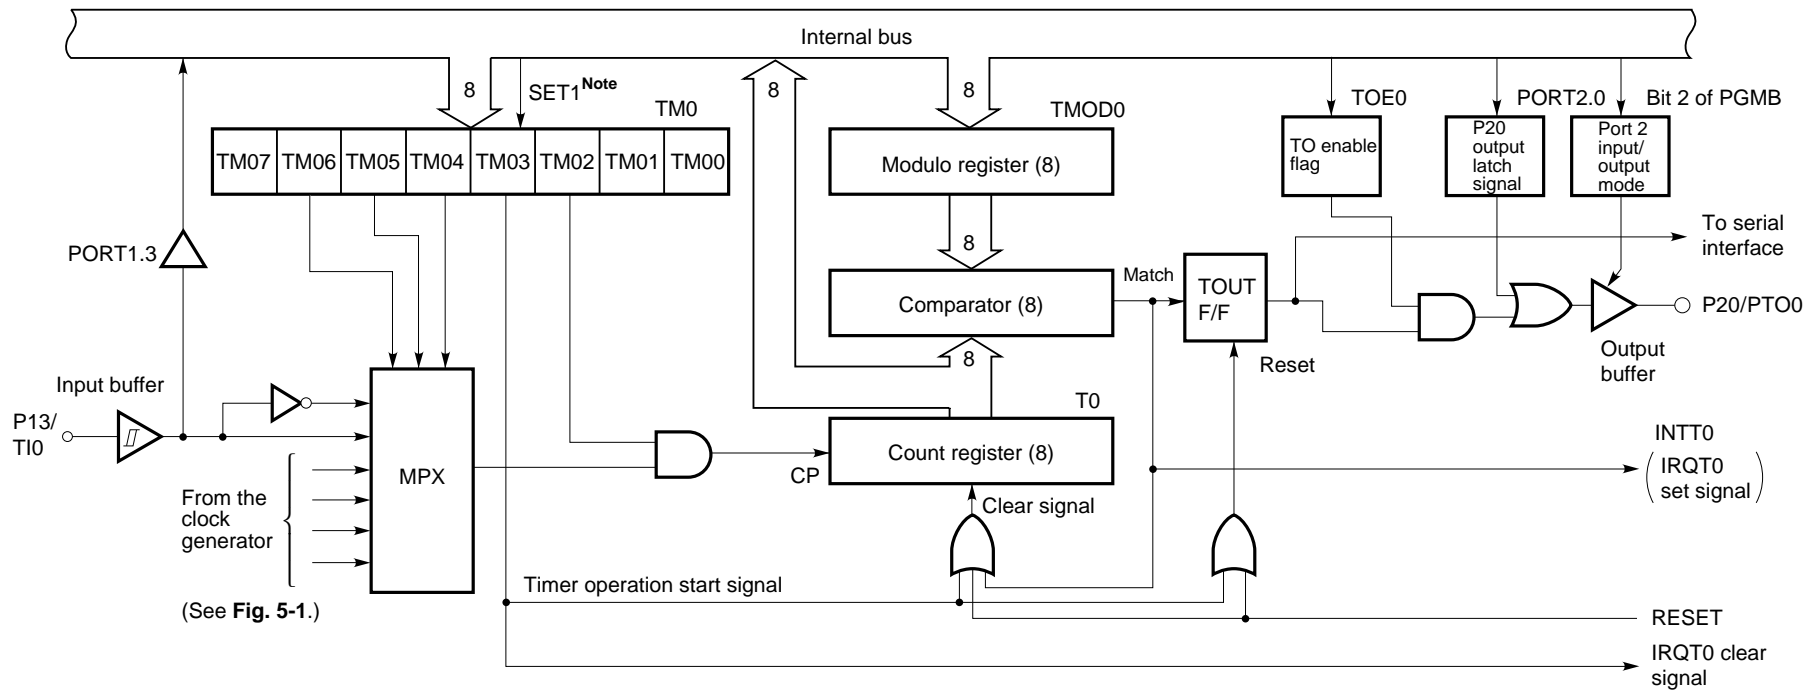

The values in parentheses indicates are for $f_x = 4.194304$ MHz and $f_{XT} = 32.768$ kHz

5.6 TIMER/EVENT COUNTER

The μPD75036 contains one channel of timer/event counter. The timer/event counter provides the following functions:

- Programmable interval timer operation
- Output of a square wave at a given frequency to the PTO0 pin
- Event counter operation
- Frequency divider operation that divides TI0 pin input by N and outputs the result to the PTO0 pin
- Supply of serial shift clock signal to a serial interface circuit
- Function of reading the state of counting

Fig. 5-5 Block Diagram of the Timer/Event Counter

Note Instruction execution

5.7 SERIAL INTERFACE

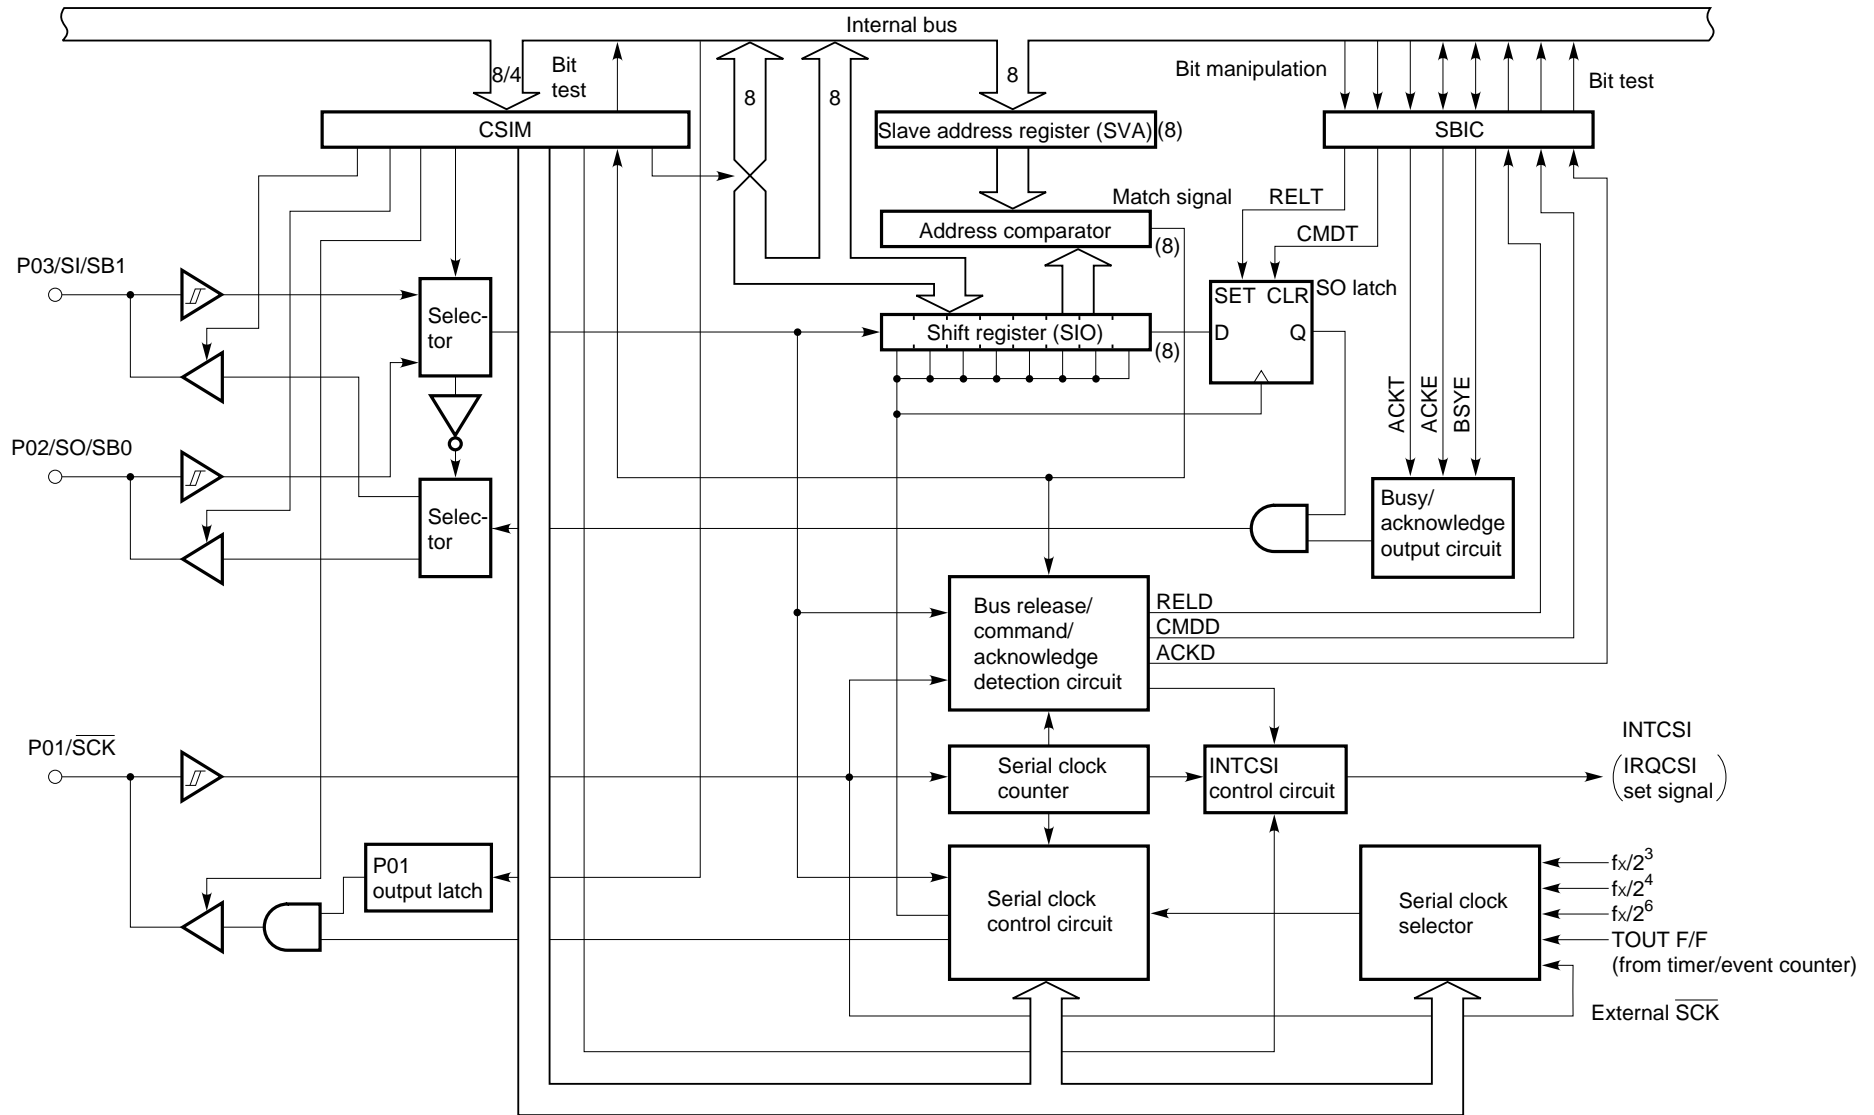

The μPD75036 has three modes.

- Three-wire serial I/O mode (The first bit is switchable between MSB and LSB.)
- Two-wire serial I/O mode (The first bit is MSB.)
- SBI mode (The first bit is MSB.)

The three-wire serial I/O mode enables connections to be made with the 75X series, 78K series, and many other types of I/O devices.

The two-wire serial I/O mode and SBI mode enable communication with two or more devices.

Fig. 5-6 Block Diagram of the Serial Interface

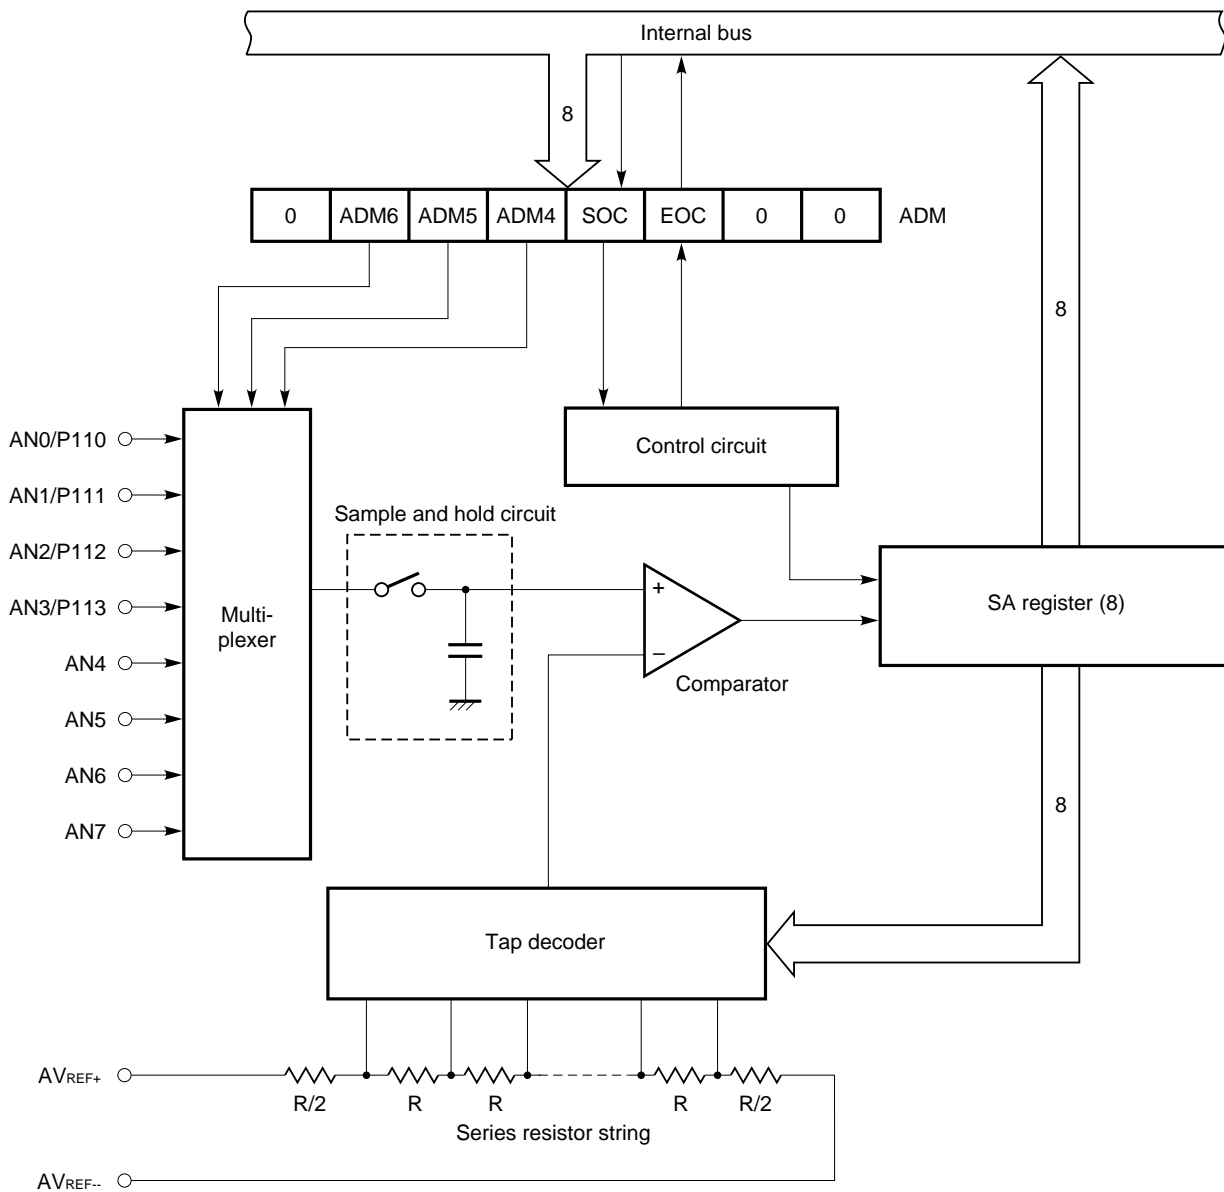

5.8 A/D CONVERTER

The μ PD75036 contains an 8-bit resolution analog/digital (A/D) converter that has eight analog input channels (AN0 - AN7).

The A/D converter employs the successive-approximation method.

Fig. 5-7 Configuration of the A/D Converter

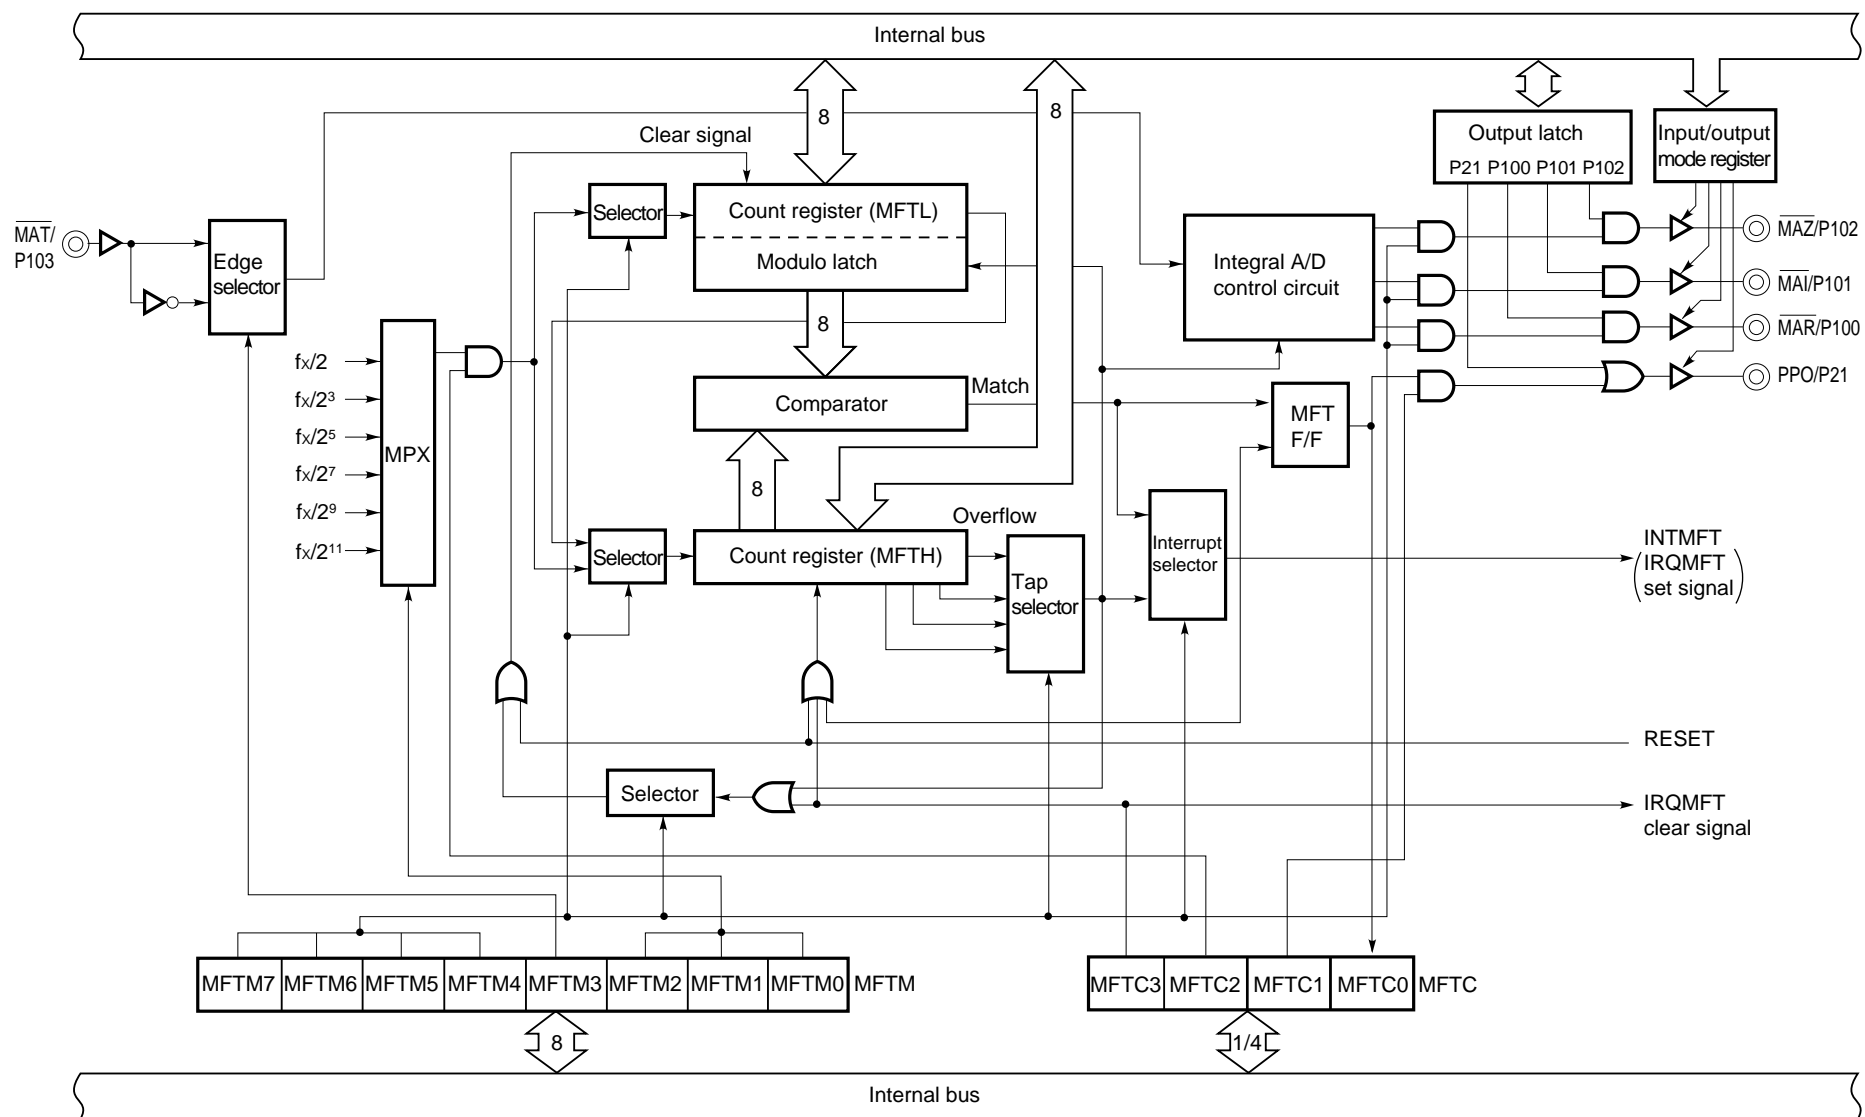

5.9 MULTIFUNCTION TIMER (MFT)

The μ PD75036 contains one multifunction timer (MFT). The MFT has four operation modes. Each mode provides the following functions:

- 8-bit timer mode
 - Operates as a programmable interval timer.
 - Outputs a square wave of an arbitrary frequency on the PPO pin.
- PWM output mode
 - Outputs a 6-bit, 7-bit, or 8-bit precision PWM signal on the PPO pin.
- 16-bit free-running timer mode
 - Operates as an interval timer that generates an interrupt at specified time intervals.
 - Usable as a one-shot timer.
- Integral A/D converter modes
 - Outputs a control signal for a 16-bit integral A/D converter.
 - Allows a resolution to be selected from 13 bits, 14 bits, 15 bits, and 16 bits.

Phase-out/Discontinued

Fig. 5-8 Block Diagram of the Multifunction Timer

6. INTERRUPT FUNCTION

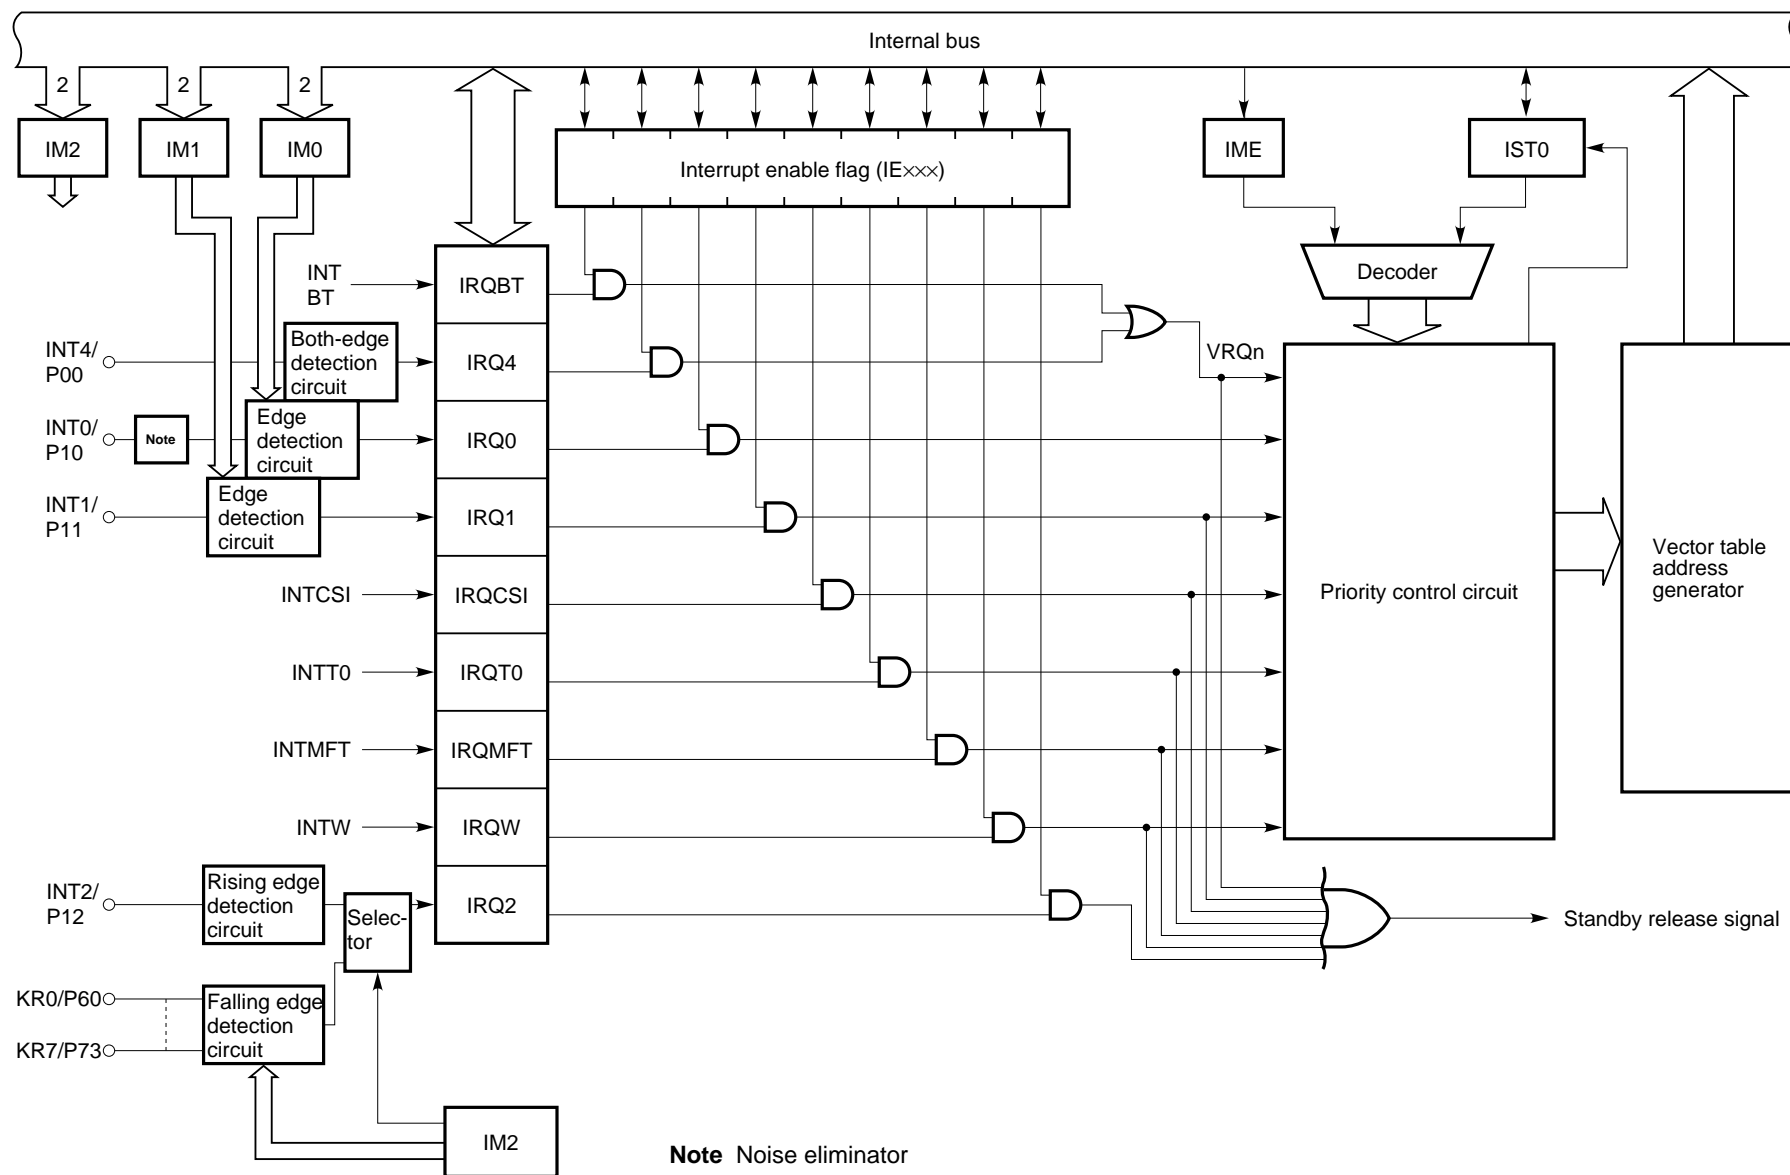

The μ PD75036 has nine vectored interrupt sources and provides multiple interrupts by software control. It also has two types of edge detected testable input pins.

The interrupt control circuitry of the μ PD75036 has the following features:

- Vectored interrupts are controlled by the hardware. Whether to accept an interrupt is controlled by an interrupt flag (IE $\times\times\times$) and interrupt master enable flag (IME).
- An interrupt start address can be freely set.
- An interrupt request flag (IRQ $\times\times\times$) can be tested. (Whether an interrupt has occurred can be checked by software.)
- A standby mode can be released. (What interrupt source to release can be selected using an interrupt enable flag.)

Phase-out/Discontinued

Fig. 6-1 Block Diagram of Interrupt Control Circuit

7. STANDBY FUNCTION

To reduce the power consumption of the system waiting for a program input, the μPD75036 has two standby modes STOP and HALT modes.

Table 7-1 Standby Modes and Operation Status

		STOP mode	HALT mode
Instruction for setting		STOP instruction	HALT instruction
System clock at setting		This mode can be set only when the main system clock is used.	This mode can be set when either the main system clock or subsystem clock is used.
Operation status	Clock generator	Only the main system clock is stopped.	Only CPU clock Φ is stopped (with oscillation continued).
	Basic interval timer	Operation is stopped.	Operation is possible only when the main system clock is oscillated. (Sets IRQBT at reference time intervals)
	Serial interface	Operation is possible only when external $\overline{\text{SCK}}$ input is selected for the serial clock.	Operation is possible only when external $\overline{\text{SCK}}$ input is selected for the serial clock or the main system clock is oscillated.
	Timer/event counter	Operation is possible only when T10 pin input is selected for the count clock.	Operation is possible only when T10 pin input is selected for the count count clock or the main system clock is oscillated.
	Clock timer	Operation is possible when f_{XT} is selected for the count clock.	Operation is possible.
	A/D converter	Operation is stopped.	Operation is possible. ^{Note}
	Multifunction timer	Operation is stopped.	Operation is possible. ^{Note}
	External interrupt	INT1, INT2, and INT4 are enabled. INT0 is disabled.	
	CPU	Operation is stopped.	
Release signal		Interrupt request signals sent out from hardware, which are enabled by interrupt enable flags, or RESET input	Interrupt request signals sent out from hardware, which are enabled by interrupt enable flags, or RESET input

Note Operation is possible only when the main system clock operates.

8. RESET FUNCTION

The μPD75036 is reset by $\overline{\text{RESET}}$ signal input.

9. INSTRUCTION SET

(1) Operand identifier and its descriptive method

The operands are described in the operand column of each instruction according to the descriptive method for the operand format of the appropriate instructions (refer to *RA75X Assembler Package User's Manual, Language* (EEU-1363) for details). For descriptions in which alternatives exist, one element should be selected. Capital letters and plus and minus signs are keywords; therefore, they should be described as they are.

For immediate data, the appropriate numerical values or labels should be described.

Identifier	Description
reg	X, A, B, C, D, E, H, L
reg1	X, B, C, D, E, H, L
rp	XA, BC, DE, HL
rp1	BC, DE, HL
rp2	BC, DE
rpa	HL, DE, DL
rpa1	DE, DL
n4	4-bit immediate data or label
n8	8-bit immediate data or label
mem ^{Note}	8-bit immediate data or label
bit	2-bit immediate data or label
fmem	FB0H - FBFH, FF0H - FFFH immediate data or label
pmem	FC0H - FFFH immediate data or label
addr	0000H - 3F7FH immediate data or label
caddr	12-bit immediate data or label
faddr	11-bit immediate data or label
taddr	20H - 7FH immediate data (however, bit 0 = 0) or label
PORTn	PORT0 - PORT11
IExxx	IEBT, IECSI, IET0, IE0, IE1, IE2, IE4, IEW, IEMFT
MBn	MB0, MB1, MB2, MB3, MB15

Note Only even address can be specified for mem when processing 8-bit data.

(2) Symbol definitions in operation description

A : A register; 4-bit accumulator
 B : B register
 C : C register
 D : D register
 E : E register
 H : H register
 L : L register

X : X register
 XA : Pair register (XA); 8-bit accumulator
 BC : Pair register (BC)
 DE : Pair register (DE)
 HL : Pair register (HL)
 PC : Program counter
 SP : Stack pointer
 CY : Carry flag; Bit accumulator
 PSW : Program status word
 MBE : Memory bank enable flag
 PORT_n : Port n (n = 0 to 11)
 IME : Interrupt master enable flag
 IE_{xxx} : Interrupt enable flag
 MBS : Memory bank selection register
 PCC : Processor clock control register
 . : Address bit delimiter
 (xx) : Contents addressed by xx
 xxH : Hexadecimal data

(3) Explanation of the symbols in the addressing area field

*1	MB = MBE•MBS (MBS = 0, 1, 2, 3, or 15)	↑ Data memory addressing ↓
*2	MB = 0	
*3	MBE = 0: MB = 0 (00H-7FH) MB = 15 (80H-FFH) MBE = 1: MB = MBS (MBS = 0, 1, 2, 3, or 15)	
*4	MB = 15, fmem = FB0H-FBFH or FF0H-FFFH	
*5	MB = 15, pmem = FC0H-FFFH	
*6	addr = 0000H-3F7FH	↑ Program memory addressing ↓
*7	addr = (Current PC) - 15 to (Current PC) - 1 or (Current PC) + 2 to (Current PC) + 16	
*8	caddr = 0000H-0FFFH (PC _{13,12} = 00B) or 1000H-1FFFH (PC _{13,12} = 01B) or 2000H-2FFFH (PC _{13,12} = 10B) or 3000H-3F7FH (PC _{13,12} = 11B)	
*9	faddr = 0000H-07FFH	
*10	taddr = 0020H-007FH	

Remarks 1. MB indicates an accessible memory bank.

2. For *2, MB is always 0 irrespective of MBE and MBS.

3. For *4 and *5, MB is always 15 irrespective of MBE and MBS.

4. *6 to *10 indicate each addressable area.

(4) Description of machine cycle column

S indicates the number of machine cycles necessary for skipping any skip instruction. The value of S changes as follows:

- When no skip is performed..... S = 0
- When a 1-byte or 2-byte instruction is skipped S = 1
- When a 3-byte instruction (BR !addr, CALL !addr instruction) is skipped S = 2

Caution The GETI instruction is skipped in one machine cycle.

One machine cycle is equivalent to one CPU clock Φ cycle (t_{CY}). Therefore, the length of the machine cycle can be selected from three different lengths by the PCC setting.

Group	Mne- monic	Operand	Bytes	Machin- ing cycle	Operation	Address- ing area	Skip condition
Transfer	MOV	A, #n4	1	1	$A \leftarrow n4$		String A

Caution When executing the IN/OUT instruction, MBE must be set to 0 or MBE and MBS must be set to 1 and 15, respectively.

10. ELECTRICAL CHARACTERISTICS

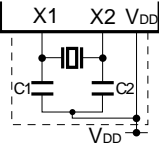

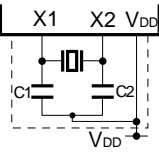

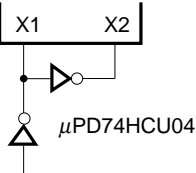

★

ABSOLUTE MAXIMUM RATINGS (T_a = 25 °C)

Parameter	Symbol	Conditions		Rated value	Unit
Supply voltage	V _{DD}			−0.3 to +7.0	V
Input voltage	V _{I1}	Ports other than ports 4, 5, and 10		−0.3 to V _{DD} + 0.3	V
	V _{I2}	Ports 4, 5, and 10	Built-in pull-up resistor	−0.3 to V _{DD} + 0.3	V
			Open drain	−0.3 to +11	V
Output voltage	V _O			−0.3 to V _{DD} + 0.3	V
High-level output current	I _{OH}	1 pin		−10	mA
		All pins		−30	mA
Low-level output current	I _{OL} ^{Note}	1 pin of parts 0, 3, 4, and 5	Peak value	30	mA
			rms	15	mA
		1 pin of ports other than ports 0, 3, 4 and 5	Peak value	20	mA
			rms	5	mA
		Total of all pins of ports 3 to 9 and 11	Peak value	170	mA
			rms	120	mA
		Total of all pins of ports 0, 2, and 10	Peak value	30	mA
			rms	20	mA
Operating temperature	T _{opt}			−40 to +85	°C
Storage temperature	T _{stg}			−65 to +150	°C

Note Calculate rms with [rms] = [peak value] × √duty.

CHARACTERISTICS OF THE MAIN SYSTEM CLOCK OSCILLATOR ($T_a = -40$ to $+85$ °C, $V_{DD} = 2.7$ to 6.0 V)

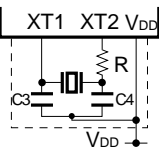

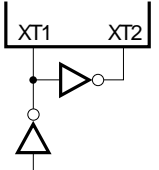

Resonator	Recommended constant	Parameter	Conditions	Min.	Typ.	Max.	Unit
Ceramic resonator		Oscillator frequency (f_x) Note 1		1.0		5.0	MHz
		Oscillation settling time Note 2				4	ms
Crystal resonator		Oscillator frequency (f_x) Note 1		1.0	4.19	5.0 Note 3	MHz
		Oscillation settling time Note 2	$V_{DD} = 4.5$ to 6.0 V			10	ms
						30	ms
External clock		X1 input frequency (f_x) Note 1		1.0		5.0	MHz
		X1 input high/low level width (t_{xH} , t_{xL})		100		500	ns

- Notes**
1. The oscillator frequency and input frequency indicate only the oscillator characteristics. See the item of AC characteristics for the instruction execution time.
 2. The oscillation settling time means the time required for the oscillation to settle after V_{DD} is applied or after the STOP mode is released.
 3. When $4.19 \text{ MHz} < f_x \leq 5.0 \text{ MHz}$, do not select PCC = 0011 as the instruction execution time. When PCC = 0011, one machine cycle falls short of $0.95 \mu\text{s}$, the minimum value for the standard.

Caution When the main system clock oscillator is used, conform to the following guidelines when wiring at the portions of surrounded by dotted lines in the figures above to eliminate the influence of the wiring capacity.

- The wiring must be as short as possible.
- Other signal lines must not run in these areas.
- Any line carrying a high fluctuating current must be kept away as far as possible.
- The grounding point of the capacitor of the oscillator must have the same potential as that of V_{DD} . It must not be grounded to ground patterns carrying a large current.
- No signal must be taken from the oscillator.

CHARACTERISTICS OF THE SUBSYSTEM CLOCK OSCILLATOR ($T_a = -40$ to $+85$ °C, $V_{DD} = 2.7$ to 6.0 V)

Resonator	Recommended constant	Parameter	Conditions	Min.	Typ.	Max.	Unit
Crystal resonator		Oscillator frequency (f_{XT}) Note 1		32	32.768	35	kHz
		Oscillation settling time Note 2	$V_{DD} = 4.5$ to 6.0 V		1.0	2	s
						10	s
External clock		XT1 input frequency (f_{XT}) Note 1		32		100	kHz
		XT1 input high/low level width (t_{XTH} , t_{XTL})		5		15	μs

- Notes**
1. The oscillator frequency and input frequency indicate only the oscillator characteristics. See the item of AC characteristics for the instruction execution time.
 2. The oscillation settling time means the time required for the oscillation to settle after V_{DD} reaches Min. of the oscillation voltage range.

Caution When the subsystem clock oscillator is used, conform to the following guidelines when wiring at the portions of surrounded by dotted lines in the figures above to eliminate the influence of the wiring capacity.

- The wiring must be as short as possible.
- Other signal lines must not run in these areas.
- Any line carrying a high fluctuating current must be kept away as far as possible.
- The grounding point of the capacitor of the oscillator must have the same potential as that of V_{DD} . It must not be grounded to ground patterns carrying a large current.
- No signal must be taken from the oscillator.

When the subsystem clock is used, pay special attention to its wiring; the subsystem clock oscillator has low amplification to minimize current consumption and is more likely to malfunction due to noise than the main system clock oscillator.

CAPACITANCE ($T_a = 25$ °C, $V_{DD} = 0$ V)

Parameter	Symbol	Conditions	Min.	Typ.	Max.	Unit
Input capacitance	C_i	$f = 1$ MHz 0 V for pins other than pins to be measured			15	pF
Output capacitance	C_o				15	pF
I/O capacitance	C_{io}				15	pF

DC CHARACTERISTICS (T_a = -40 to +85 °C, V_{DD} = 2.7 to 6.0 V)

Parameter	Symbol	Conditions		Min.	Typ.	Max.	Unit
High-level input voltage	V _{IH1}	Ports 2, 3, 8, 9, and 11		0.7V _{DD}		V _{DD}	V

			V _{DD} =			μA
			3 V ±10 %	T _a = 25 °C		μA

- Notes**
1. This current excludes the current which flows through the built-in pull-up resistors.
 2. This value applies also when the subsystem clock oscillates.
 3. Value when the processor clock control register (PCC) is set to 0011 and the μPD75036 is operated in the high-speed mode
 4. Value when the PCC is set to 0000 and the μPD75036 is operated in the low-speed mode
 5. This value applies when the system clock control register (SCC) is set to 1001 to stop the main system clock pulse and to start the subsystem clock pulse.

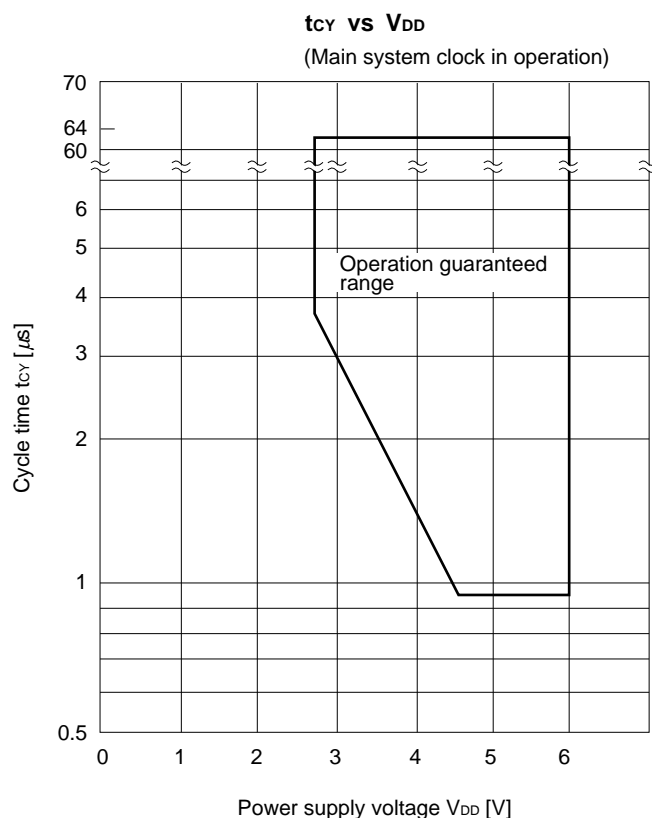

AC CHARACTERISTICS ($T_a = -40$ to $+85$ °C, $V_{DD} = 2.0$ to 6.0 V)

Parameter	Symbol	Conditions	Min.	Typ.	Max.	Unit
CPU clock cycle time (minimum instruction execution time = 1 machine cycle) Note 1	t_{CY}	Operated by main system clock pulse	$V_{DD} = 4.5$ to 6.0 V	0.95		μs
				3.8	64	μs
		Operated by subsystem clock pulse		114	122	μs
TIO input frequency	f_{TI}	$V_{DD} = 4.5$ to 6.0 V	0		1	MHz
			0		275	kHz
TIO input high/low level width	t_{TIH} , t_{TIL}	$V_{DD} = 4.5$ to 6.0 V	0.48			μs
			1.8			μs
Interrupt input high/low level width	t_{INTH} , t_{INTL}	INT0	Note 2			μs
		INT1, INT2, and INT4	10			μs
		KR0 to KR7	10			μs
$\overline{\text{RESET}}$ low level width	t_{RSL}		10			μs

Notes 1. The cycle time of the CPU clock (Φ) depends on the connected resonator frequency, the system clock control register (SCC), and the processor clock control register (PCC).

The figure on the right side shows the cycle time t_{CY} characteristics for the supply voltage V_{DD} during main system clock operation.

2. This value becomes $2t_{CY}$ or $128/f_x$ according to the setting of the interrupt mode register (IM0).

Serial transfer operation

Two-wire and three-wire serial I/O modes ($\overline{\text{SCK}}$... Internal clock output):

Parameter	Symbol	Conditions		Min.	Typ.	Max.	Unit
$\overline{\text{SCK}}$ cycle time	t_{KCY1}	$V_{\text{DD}} = 4.5 \text{ to } 6.0 \text{ V}$		1600			ns
				3800			ns
$\overline{\text{SCK}}$ high/low level width	t_{KL1}	$V_{\text{DD}} = 4.5 \text{ to } 6.0 \text{ V}$		$t_{\text{KCY1}}/2 - 50$			ns
	t_{KH1}			$t_{\text{KCY1}}/2 - 150$			ns
SI setup time (referred to $\overline{\text{SCK}}\uparrow$)	t_{SIK1}			150			ns
SI hold time (referred to $\overline{\text{SCK}}\uparrow$)	t_{KSI1}			400			ns
Delay time from $\overline{\text{SCK}}\downarrow$ to SO output	t_{KSO1}	$R_{\text{L}} = 1 \text{ k}\Omega$, $C_{\text{L}} = 100 \text{ pF}$ ^{Note}	$V_{\text{DD}} = 4.5 \text{ to } 6.0 \text{ V}$	0		250	ns
				0		1000	ns

Two-wire and three-wire serial I/O modes ($\overline{\text{SCK}}$... External clock input):

Parameter	Symbol	Conditions		Min.	Typ.	Max.	Unit
$\overline{\text{SCK}}$ cycle time	t_{KCY2}	$V_{\text{DD}} = 4.5 \text{ to } 6.0 \text{ V}$		800			ns
				3200			ns
$\overline{\text{SCK}}$ high/low level width	t_{KL2}	$V_{\text{DD}} = 4.5 \text{ to } 6.0 \text{ V}$		400			ns
	t_{KH2}			1600			ns
SI setup time (referred to $\overline{\text{SCK}}\uparrow$)	t_{SIK2}			100			ns
SI hold time (referred to $\overline{\text{SCK}}\uparrow$)	t_{KSI2}			400			ns
Delay time from $\overline{\text{SCK}}\downarrow$ to SO output	t_{KSO2}	$R_{\text{L}} = 1 \text{ k}\Omega$, $C_{\text{L}} = 100 \text{ pF}$ ^{Note}	$V_{\text{DD}} = 4.5 \text{ to } 6.0 \text{ V}$	0		300	ns
				0		1000	ns

Note R_{L} and C_{L} are the resistance and capacitance of the SO output line load respectively.

SBI mode ($\overline{\text{SCK}}$... Internal clock output (master)):

Parameter	Symbol	Conditions		Min.	Typ.	Max.	Unit
$\overline{\text{SCK}}$ cycle time	t_{KCY3}	$V_{\text{DD}} = 4.5 \text{ to } 6.0 \text{ V}$		1600			ns
				3800			ns
$\overline{\text{SCK}}$ high/low level width	t_{KL3}	$V_{\text{DD}} = 4.5 \text{ to } 6.0 \text{ V}$		$t_{\text{KCY3}}/2 - 50$			ns
	t_{KH3}			$t_{\text{KCY3}}/2 - 150$			ns
SB0/SB1 setup time (referred to $\overline{\text{SCK}}\uparrow$)	t_{SIK3}			150			ns
SB0/SB1 hold time (referred to $\overline{\text{SCK}}\uparrow$)	t_{KSI3}			$t_{\text{KCY3}}/2$			ns
Delay time from $\overline{\text{SCK}}\downarrow$ to SB0/SB1 output	t_{KS03}	$R_{\text{L}} = 1 \text{ k}\Omega$, $C_{\text{L}} = 100 \text{ pF}$ ^{Note}	$V_{\text{DD}} = 4.5 \text{ to } 6.0 \text{ V}$	0		250	ns
				0		1000	ns
From $\overline{\text{SCK}}\uparrow$ to SB0/SB1 \downarrow	t_{KSB}			t_{KCY3}			ns
From SB0/SB1 \downarrow to $\overline{\text{SCK}}\downarrow$	t_{SBK}			t_{KCY3}			ns
SB0/SB1 low level width	t_{SBL}			t_{KCY3}			ns
SB0/SB1 high level width	t_{SBH}			t_{KCY3}			ns

SBI mode ($\overline{\text{SCK}}$... External clock input (slave)):

Parameter	Symbol	Conditions		Min.	Typ.	Max.	Unit
$\overline{\text{SCK}}$ cycle time	t_{KCY4}	$V_{\text{DD}} = 4.5 \text{ to } 6.0 \text{ V}$		800			ns
				3200			ns
$\overline{\text{SCK}}$ high/low level width	t_{KL4}	$V_{\text{DD}} = 4.5 \text{ to } 6.0 \text{ V}$		400			ns
	t_{KH4}			1600			ns
SB0/SB1 setup time (referred to $\overline{\text{SCK}}\uparrow$)	t_{SIK4}			100			ns
SB0/SB1 hold time (referred to $\overline{\text{SCK}}\uparrow$)	t_{KSI4}			$t_{\text{KCY4}}/2$			ns
Delay time from $\overline{\text{SCK}}\downarrow$ to SB0/SB1 output	t_{KS04}	$R_{\text{L}} = 1 \text{ k}\Omega$, $C_{\text{L}} = 100 \text{ pF}$ ^{Note}	$V_{\text{DD}} = 4.5 \text{ to } 6.0 \text{ V}$	0		300	ns
				0		1000	ns
From $\overline{\text{SCK}}\uparrow$ to SB0/SB1 \downarrow	t_{KSB}			t_{KCY4}			ns
From SB0/SB1 \downarrow to $\overline{\text{SCK}}\downarrow$	t_{SBK}			t_{KCY4}			ns
SB0/SB1 low level width	t_{SBL}			t_{KCY4}			ns
SB0/SB1 high level width	t_{SBH}			t_{KCY4}			ns

Note R_{L} and C_{L} are the resistance and capacitance of the SB0/SB1 output line load respectively.

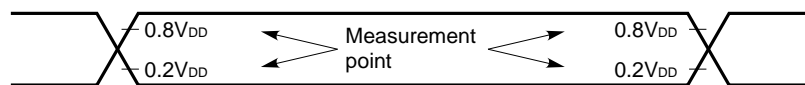

A/D converter ($T_a = -40$ to $+85$ °C, $V_{DD} = 2.7$ to 6.0 V, $AV_{SS} = V_{SS} = 0$ V)

Parameter	Symbol	Conditions		Min.	Typ.	Max.	Unit
Resolution				8	8	8	bit
Absolute accuracy ^{Note 1}		$2.5 \text{ V} \leq AV_{REF} \leq V_{DD}$	$-10 \leq T_a \leq +85^\circ\text{C}$			± 1.5	LSB
			$-40 \leq T_a < -10^\circ\text{C}$			± 2.0	
Conversion time ^{Note 2}	t_{CONV}					$168/f_x$	μs
Sampling time ^{Note 3}	t_{SAMP}					$44/f_x$	μs
Analog input voltage	V_{IAN}			AV_{REF-}		AV_{REF+}	V
Analog power supply voltage	AV_{DD}			2.5		V_{DD}	V
Reference input voltage ^{Note 4}	AV_{REF+}	$2.5 \text{ V} \leq (AV_{REF+}) - (AV_{REF-})$		2.5		AV_{DD}	V
Reference output voltage ^{Note 4}	AV_{REF-}	$2.5 \text{ V} \leq (AV_{REF+}) - (AV_{REF-})$		0		1.0	V
Analog input impedance	R_{AN}				1000		MΩ
AV_{REF} current	AI_{REF}				1.0	2.0	mA

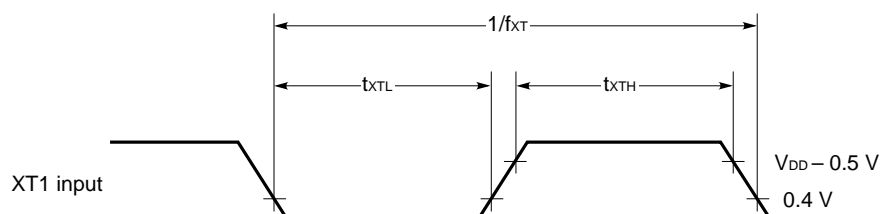

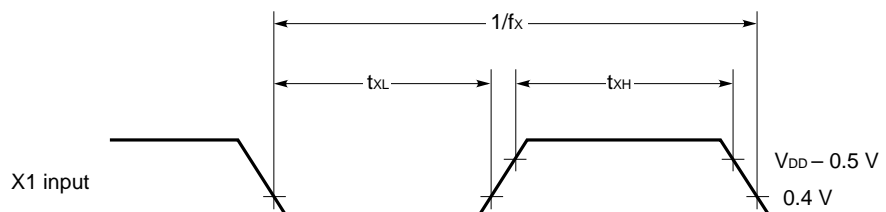

Notes 1. Absolute accuracy excluding quantization error ($\pm 1/2$ LSB)

2. Time from the execution of a conversion start instruction till the end of conversion ($EOC = 1$)
($40.1 \mu\text{s}$: $f_x = 4.19 \text{ MHz}$)
3. Time from the execution of a conversion start instruction till the end of sampling ($10.5 \mu\text{s}$: $f_x = 4.19 \text{ MHz}$)
4. The value resulting from subtracting (AV_{REF-}) from (AV_{REF+}) must be greater than or equal to 2.5 V.

DATA HOLD CHARACTERISTICS BY LOW SUPPLY VOLTAGE IN DATA MEMORY STOP MODE

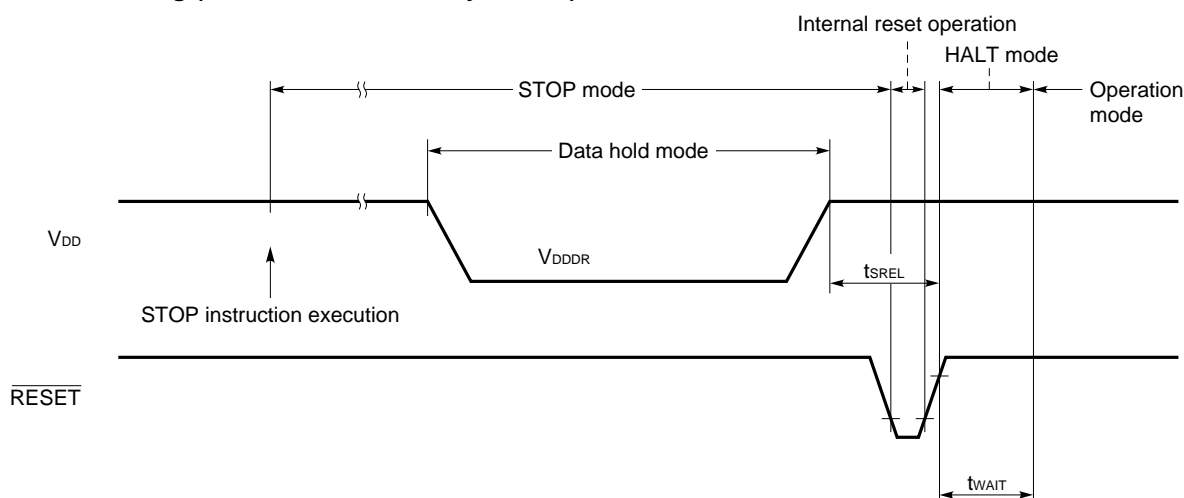

(T_a = -40 to +85 °C)

Parameter	Symbol	Conditions	Min.	Typ.	Max.	Unit
Data hold supply voltage	V _{DDDR}		2.0		6.0	V
Data hold supply current ^{Note 1}	I _{DDDR}	V _{DDDR} = 2.0 V		0.1	10	μA
Release signal setting time	t _{SREL}		0			μs
Oscillation settling time ^{Note 2}	t _{WAIT}	Release by $\overline{\text{RESET}}$		2 ¹⁷ /f _x		ms
		Release by interrupt request		Note 3		ms

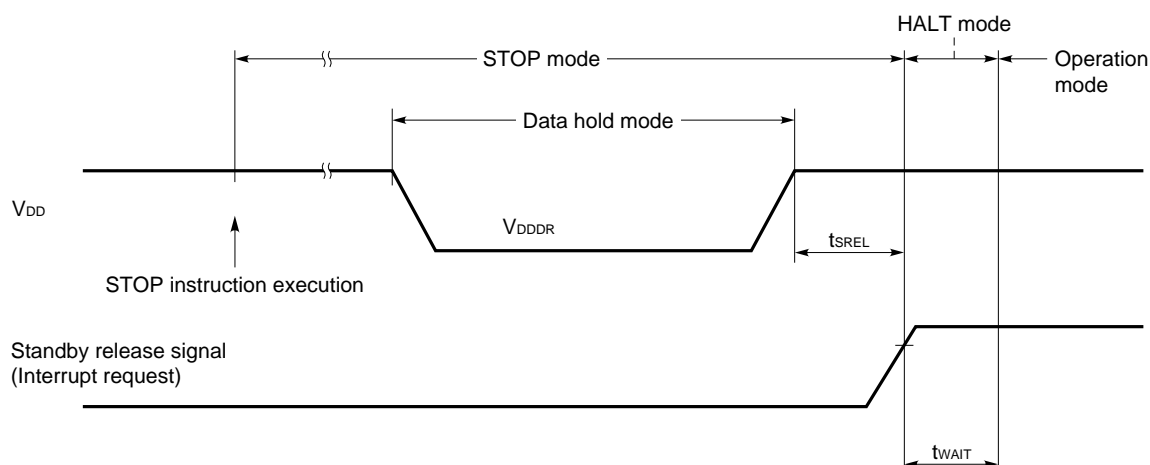

- Notes**
1. Excluding the current which flows through the built-in pull-up resistors
 2. CPU operation stop time for preventing unstable operation at the beginning of oscillation
 3. This value depends on the settings of the basic interval timer mode register (BTM) shown below.

BTM3	BTM2	BTM1	BTM0	Wait time (Values at f _x = 4.19 MHz in parentheses)
—	0	0	0	2 ²⁰ /f _x (approx. 250 ms)
—	0	1	1	2 ¹⁷ /f _x (approx. 31.3 ms)
—	1	0	1	2 ¹⁵ /f _x (approx. 7.82 ms)
—	1	1	1	2 ¹³ /f _x (approx. 1.95 ms)

★ APPENDIX A DEVELOPMENT TOOLS

The following development tools are provided for developing systems including the μPD75036:

Hardware	IE-75000-R ^{Note 1} IE-75001-R	In-circuit emulator for the 75X series
	IE-75000-R-EM ^{Note 2}	Emulation board for the IE-75000-R and IE-75001-R
	EP-75028CW-R	Emulation probe for the μPD75036CW
	EP-75028GC-R EV-9200GC-64	Emulation probe for the μPD75036GC. A 64-pin conversion socket, the EV-9200GC-64, is attached to the probe.
	PG-1500	PROM programmer
	PA-75P036CW	PROM programmer adapter for the μPD75P036CW. Connected to the PG-1500.
	PA-75P036GC	PROM programmer adapter for the μPD75P036GC. Connected to the PG-1500.
Software	IE control program	Host machine • PC-9800 series (MS-DOS™ Ver. 3.30 to Ver. 5.00A ^{Note 3}) • IBM PC/AT™ series (PC DOS™ Ver. 3.10)
	PG-1500 controller	
	RA75X relocatable assembler	

Notes 1. Maintenance service only

2. Not contained in the IE-75001-R

3. These software cannot use the task swap function, which is available in MS-DOS Ver. 5.00 and Ver. 5.00A.

[MEMO]

Cautions on CMOS Devices

① **Countermeasures against static electricity for all MOSs**

Caution When handling MOS devices, take care so that they are not electrostatically charged.

Strong static electricity may cause dielectric breakdown in gates. When transporting or storing MOS devices, use conductive trays, magazine cases, shock absorbers, or metal cases that NEC uses for packaging and shipping. Be sure to ground MOS devices during assembling. Do not allow MOS devices to stand on plastic plates or do not touch pins.

Also handle boards on which MOS devices are mounted in the same way.

② **CMOS-specific handling of unused input pins**

Caution Hold CMOS devices at a fixed input level.

Unlike bipolar or NMOS devices, if a CMOS device is operated with no input, an intermediate-level input may be caused by noise. This allows current to flow in the CMOS device, resulting in a malfunction. Use a pull-up or pull-down resistor to hold a fixed input level. Since unused pins may function as output pins at unexpected times, each unused pin should be separately connected to the V_{DD} or GND pin through a resistor.

If handling of unused pins is documented, follow the instructions in the document.

③ **Statuses of all MOS devices at initialization**

Caution The initial status of a MOS device is unpredictable when power is turned on.

Since characteristics of a MOS device are determined by the amount of ions implanted in molecules, the initial status cannot be determined in the manufacture process. NEC has no responsibility for the output statuses of pins, input and output settings, and the contents of registers at power on. However, NEC assures operation after reset and items for mode setting if they are defined.

When you turn on a device having a reset function, be sure to reset the device first.

[MEMO]

No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Corporation. NEC Corporation assumes no responsibility for any errors which may appear in this document.

NEC Corporation does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from use of a device described herein or any other liability arising from use of such device. No license, either express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Corporation or others.

The devices listed in this document are not suitable for uses in aerospace equipment, submarine cables, nuclear reactor control systems and life support systems. If customers intend to use NEC devices for above applications or they intend to use "Standard" quality grade NEC devices for the applications not intended by NEC, please contact our sales people in advance.

Application examples recommended by NEC Corporation

Standard: Computer, Office equipment, Communication equipment, Test and Measurement equipment, Machine tools, Industrial robots, Audio and Visual equipment, Other consumer products, etc.

Special: Automotive and Transportation equipment, Traffic control systems, Antidisaster systems, Anticrime system, etc.
