# M35012-XXXSP, M35013-XXXSP

## SCREEN CHARACTER and PATTERN DISPLAY CONTROLLERS

### DESCRIPTION

The M35012-XXXSP and M35013-XXXSP are TV screen display control IC which can be used to display information such as program schedules, the date and messages on the TV screen.

The differences among M35012-XXXSP and M35013-XXXSP are noted below.

The descriptions that follow describe the M35013-XXXSP unless otherwise noted.

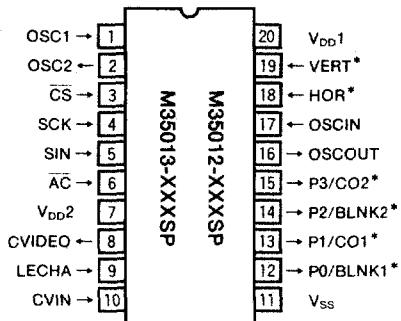

Type name	M35012-XXXSP	M35013-XXXSP
Characters available	256	128
Data input	16 bits serial input	8 bits serial input
Exclusion function	Exclusion 1 and 2 function	Exclusion 1 function
CONT7F function	Normal/FF <sub>16</sub> writing mode	Normal/7F <sub>16</sub> writing mode

For M35013-001SP and M35012-001SP that are standard ROM version of M35013-XXXSP and M35012-XXXSP respectively, the I/O polarity of pin and the character pattern are also mentioned.

### FEATURES

- Screen composition ..... 24 columns × 10 lines
- Number of characters displayed ..... 240 (Max.)
- Character composition ..... 12 × 18 dot matrix
- Characters available
  - M35013-XXXSP ..... 128 characters
  - M35012-XXXSP ..... 256 characters
- Character sizes available ..... 4 (horizontal) × 4 (vertical)
- Display locations available
  - Horizontal direction ..... 62 locations
  - Vertical direction ..... 64 locations
- Blinking ..... Character units
  - Cycle : approximately 1 second, or approximately 0.5 seconds
  - Duty : 25%, 50%, or 75%
- Data input
  - M35013-XXXSP ..... By the 8-bit serial input function
  - M35012-XXXSP ..... By the 16-bit serial input function
- Coloring
  - Background coloring (composite video signal)
- Blanking
  - Total blanking (14 × 18 dots)
  - Border size blanking
  - Character size blanking
- Synchronization signal
  - Composite synchronization signal generation (PAL, NTSC, M-PAL)
- Synchronized separation circuit ..... Built-in
- 4 output ports (2 digital lines)
- Oscillation stop function
  - Be possible to stop the oscillation for display and for synchronized signal generation

### PIN CONFIGURATION (TOP VIEW)

### Outline 20P4B

Note : The pins remarked "\*" are selectable the input or output polarity when the character ROM masked.

- Exclusion function
  - M35013-XXXSP ..... 1
  - M35012-XXXSP ..... 2
- Reversed character display function

### APPLICATION

TV, VCR, Camcorder

**MITSUBISHI MICROCOMPUTERS**  
**M35012-XXXSP, M35013-XXXSP**

**SCREEN CHARACTER and PATTERN DISPLAY CONTROLLERS**

**PIN DESCRIPTION**

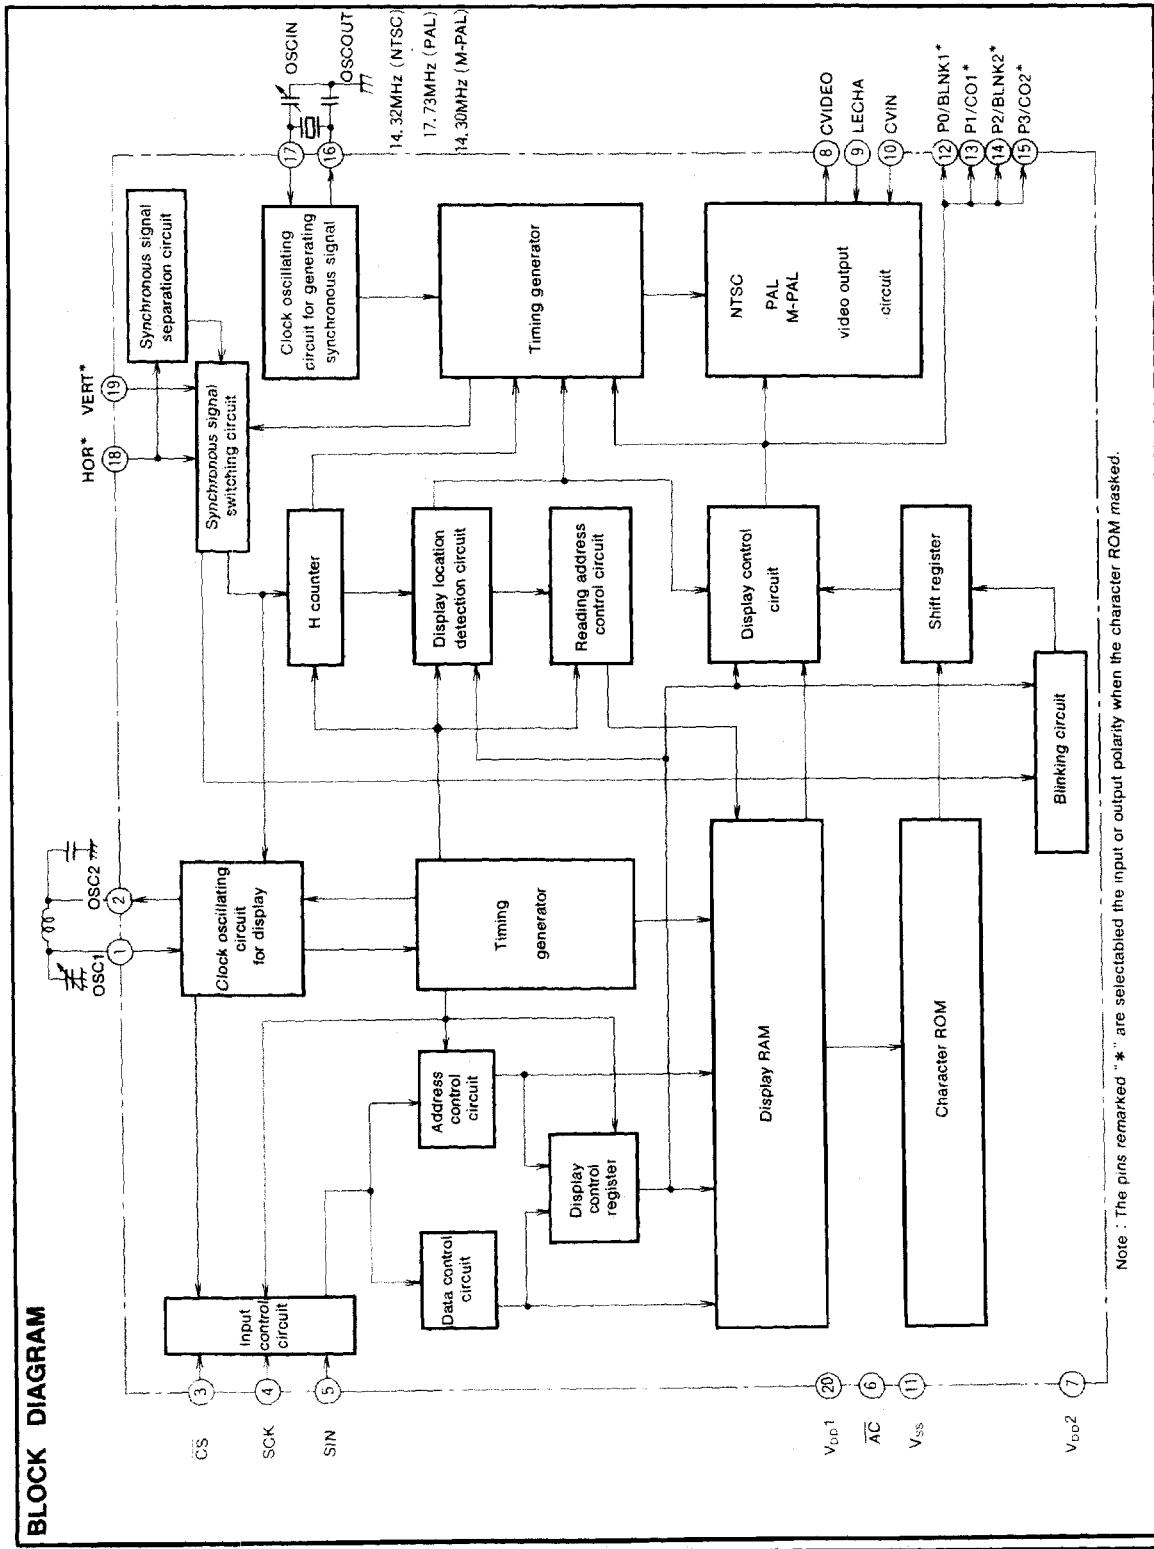

Pin Number	Symbol	Pin name	Input /Output	Function
1	OSC1	Pins for attachment of external oscillator circuit	Input	There are the pins for attaching an external display oscillator circuit. The standard oscillation frequency is approximately 7MHz. This oscillation frequency determines the horizontal position of the display on the TV screen and the width of the characters.
2	OSC2		Output	
3	CS	Chip select input	Input	This is the chip select pin, and when serial data transmission is being carried out, it goes to "L". Hysteresis input. Includes built-in pull-up resistor.
4	SCK	Serial clock input	Input	When CS pin is "L", SIN serial data is taken in when SCK rises. Hysteresis input. Built-in pull-up resistor is included.
5	SIN	Serial data input	Input	This is the pin for serial input of data and addresses for the display control register and the display data memory. Hysteresis input. Inculdes built-in pull-up resistor.
6	AC	Auto-clear input	Input	When "L", this pin resets the internal IC circuit. Hysteresis input. Includes built-in pull-up resistor.
7	V <sub>DD</sub> 2	Power pin	—	Please connect to +5V with the analog circuit power pin.
8	CVVIDEO	Composite video signal output	Output	This is the output pin for composite video signals. It outputs 2V <sub>p-p</sub> composite video signals. In superimpose mode, character output etc. is superimposed on the external composite video signals from CVIN.
9	LECHA	Character level input	Input	This is the input pin which determines the "white" character color level in the composite video signal.
10	CVIN	Composite video signal input	Input	This is the input pin for external composite video signals. In superimpose mode, character output etc. is superimposed on these external composite video signals.
11	V <sub>SS</sub>	Earthing pin	—	Please connect to GND using circuit earthing pin.
12	P0	Port P0 output	Output	This pin can be toggled between port pin output and BLNK1* (character background) signal output. Polarity can be selected when the character ROM is masked.
13	P1	Port P1 output	Output	This pin can be toggled between port pin output and CO1* (character) signal output. Polarity can be selected when the character ROM is masked.
14	P2	Port P2 output	Output	This pin can be toggled between port pin output and BLNK2* (character background) signal output. Polarity can be selected when the character ROM is masked.
15	P3	Port P3 output	Output	This pin can be toggled between port pin output and CO2* (character) signal output. Polarity can be selected when the character ROM is masked.
16	OSCOUT	Pins for attachment of external oscillator circuit for synchronization signal generation	Output	These are the pins for attaching an external oscillator circuit for generating the synchronization signal. An oscillation of 14.32MHz is needed for NTSC, 17.73MHz is needed for PAL and 14.30MHz is needed for M-PAL.
17	OSCIN		Input	
18	HOR*	Horizontal synchronization signal input	Input	This pin inputs the horizontal synchronization signal. Hysteresis input. Polarity can be selected when the character ROM is masked.
19	VERT*	Vertical synchronization signal input	Input	This pin inputs the vertical synchronization signal. Hysteresis input. Polarity can be selected when the character ROM is masked.
20	V <sub>DD</sub> 1	Power pin	—	Please connect to +5V with the digital circuit power pin.

Note : The pins remarked "\*" are selectable the input or output polarity when the character ROM masked.

Fig. 1 Memory constitution (M35013-XXXSP)

At the M35013-XXXSP

The internal circuit is reset and all display control registers (address  $F0_{16}$  to  $F8_{16}$ ) are set to "0" and display RAM (address  $00_{16}$  to  $EF_{16}$ ) are set to " $7F_{16}$ " when the AC pin level is "L". The memory constitution is shown in Figure 1.

At the M35012-XXXSP

The internal circuit is reset and all display control registers (address  $F0_{16}$  to  $F8_{16}$ ) are set to "0" and display RAM (address  $00_{16}$  to  $EF_{16}$ ) are set to " $FF_{16}$ " when the AC pin level is "L". The memory constitution is shown in Figure 2.

7	DSPON	⑫	Display OFF		Display can be altered.									
		1	Display ON											

Notes 1. When crystal oscillation move from external synchronous to internal synchronous at stop state (STOPIN=1), leave the crystal oscillation state (STOPIN=0) before 1V (vertical synchronous NTSC, M-PAL about 16.7ms, PAL 20ms) or more.

2. The mark ○ around the status value means the reset status by the "L" level is input to AG pin.

**MITSUBISHI MICROCOMPUTERS**  
**M35012-XXXSP, M35013-XXXSP**

**SCREEN CHARACTER and PATTERN DISPLAY CONTROLLERS**

**DISPLAY FORMS**

M35013-XXXSP has the following five display forms as the blanking function, when CO1\*, BLNK1\*, CO2\*, and BLNK2\* are output.

- (1) Blanking OFF : Blanking output signal (BLNK\*) is cut off.
- (2) Character size : Blanking same as the character size.

(3) Border size : Blanking the background as a size from character.

(4) Matrix-outline size : Blanking the background as a size from all character font size.

This display format allows each line (from the first line to the tenth line) to be controlled independently, so that two kinds of display formats can be combined on the same screen.

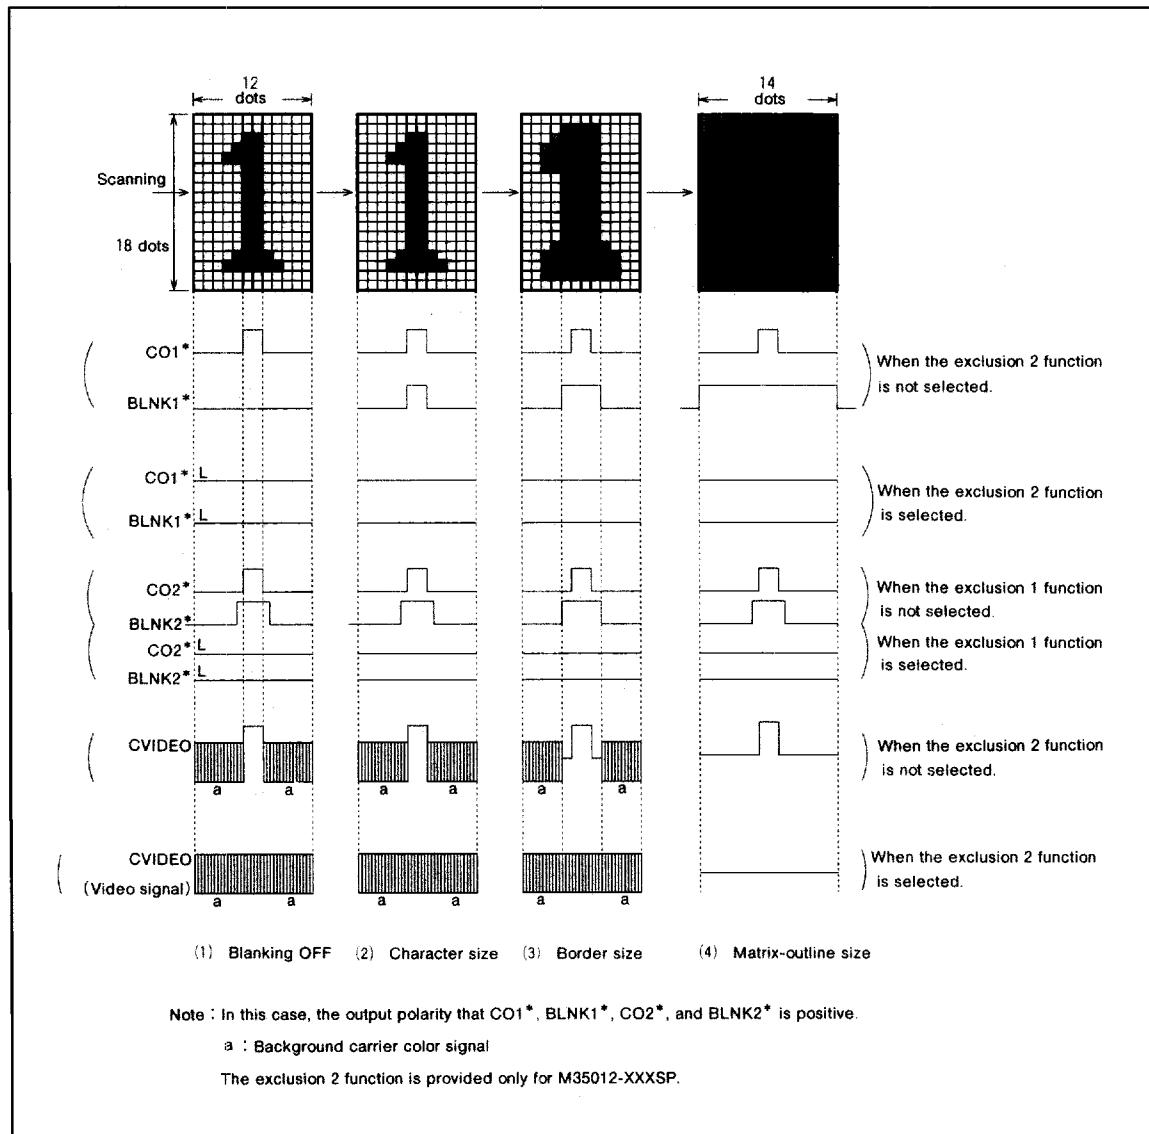

Fig. 4 Display forms at each display mode

**MITSUBISHI MICROCOMPUTERS**  
**M35012-XXXSP, M35013-XXXSP**

**SCREEN CHARACTER and PATTERN DISPLAY CONTROLLERS**

**EXCLUSION FUNCTION**

For M35013-XXXSP, the function expansion that is set with the EXP1 and EXP0 registers (DA3 and DA2 of address F5<sub>16</sub>) is performed when "1" is set to DA7 of display RAM (EXP bit).

**Table 1** Display form of M35013-XXXSP

Register		Display form	
EXP1	EXP0		
0	0	Normal character + Blinking	
0	1	Reversed character (no blinking)	
1	0	Normal character + Exclusion 1	
1	1	Reversed character + Exclusion 1	

For M35012-XXXSP, the displays shown in table 2 are available with the combination of DA9 (BLINK bit), DAA (REV bit) of display RAM and EXP1, EXP0 register (DA3 and DA2 of address F5<sub>16</sub>).

When the exclusion 1 function is selected, CO2 \* and BLNK2\* side are not displayed.

When the exclusion 2 function is selected, CO1\*, BLNK1\*, and video signal side are not displayed.

The character of exclusion 2 and exclusion 1 are prohibited to be next to each other horizontally. Insert "FF<sub>16</sub>" of character between the character of exclusion 2 and that of exclusion 1.

**Table 2** Display form of M35012-XXXSP

Register		RAM		Display form
EXP1	EXP0	REV	BLINK	
0	0	0	0	Normal character
		0	1	Normal character + Blinking
		1	0	Reversed character
		1	1	Reversed character + Blinking
0	1	0	0	Normal character + Exclusion 2
		0	1	Normal character + Blinking + Exclusion 1
		1	0	Reversed character + Exclusion 2
		1	1	Reversed character + Blinking + Exclusion 1

**SERIAL DATA INPUT TIMING**

At the M35013-XXXSP

- (1) Serial data should be input with the LSB first.
- (2) The address consists of 8 bits.
- (3) The data consists of 8 bits.
- (4) The 8 bits in the SCK after the  $\overline{CS}$  signal has fallen are the address, and for succeeding input data, the address is incremented every 8 bits.

At the M35012-XXXSP

- (1) Serial data should be input with the LSB first.
- (2) The address consists of 16 bits.
- (3) The data consists of 16 bits.
- (4) The 16 bits in the SCK after the  $\overline{CS}$  signal has fallen are the address, and for succeeding input data, the address is incremented every 16 bits.

## **SCREEN CHARACTER and PATTERN DISPLAY CONTROLLERS**

## **CONT7F FUNCTION**

When the register CONT7F (DA6 of address F8<sub>16</sub>) is set to "1" and data input as the timing shown in Figure 11, the character code 7F<sub>16</sub>\* (blank) can be set to display RAM automatically. However, be necessary to set the hold time. While this function is operating, never stop the display oscillation OSC1 and OSC2, and set the register STOP1 (DA5 of address F8<sub>16</sub>) to "0".

\*For M35012-XXXSP, the character code FF<sub>16</sub> (blank) can be set to display RAM automatically.

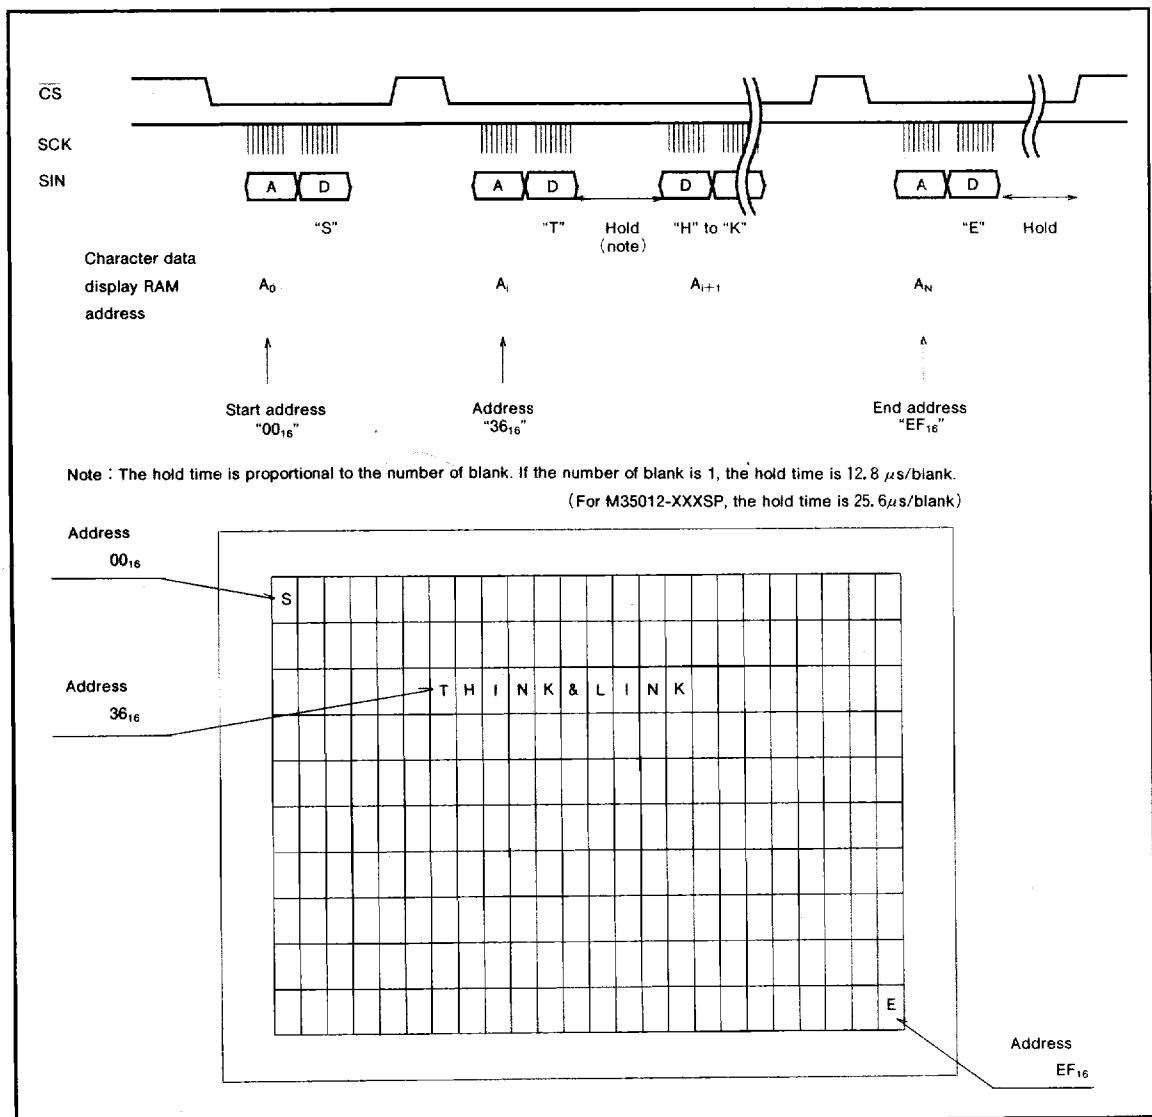

Fig. 11 CONT7F functional timing

SCREEN CHARACTER and PATTERN DISPLAY CONTROLLERS

**TIME BASE (SYNCHRONOUS SIGNAL CORRECTION) FUNCTION**

Time base function can correct the errors from the lost synchronous signal or disordered synchronization by a noise, using the reference clock fosc1.

The following are the correction method.

- (1) Time base 0—TBASE0 (DA6 of address F1<sub>16</sub>)="1".
  - Cut-off a noise effect to synchronous signal.
  - Cut-off a noise during D period of Figure 12.
- (2) Time base 1—TBASE1 (DA7 of address F1<sub>16</sub>)="1"
  - Correct the lost synchronous signal.
  - Generate the pulse if the synchronous signal has not input during C period of Figure 12. And stop to display the character till the next synchronous signal is input.

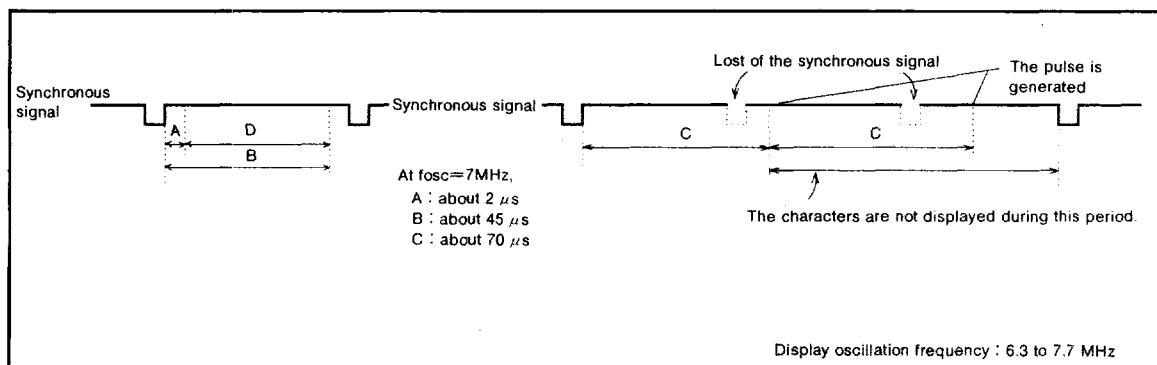

Fig. 12 Example of time base function

**SCREEN CHARACTER and PATTERN DISPLAY CONTROLLERS**

**Note for Supplying Power**

Timing of power supplying to  $\overline{AC}$  pin

The internal circuit of M35012-XXXSP/M35013-XXXSP is reset when the level of the auto clear input pin  $\overline{AC}$  is "L". This pin is hysteresis input with the pull-up resistor. The timing about power supplying of  $\overline{AC}$  pin is shown in Figure 16.

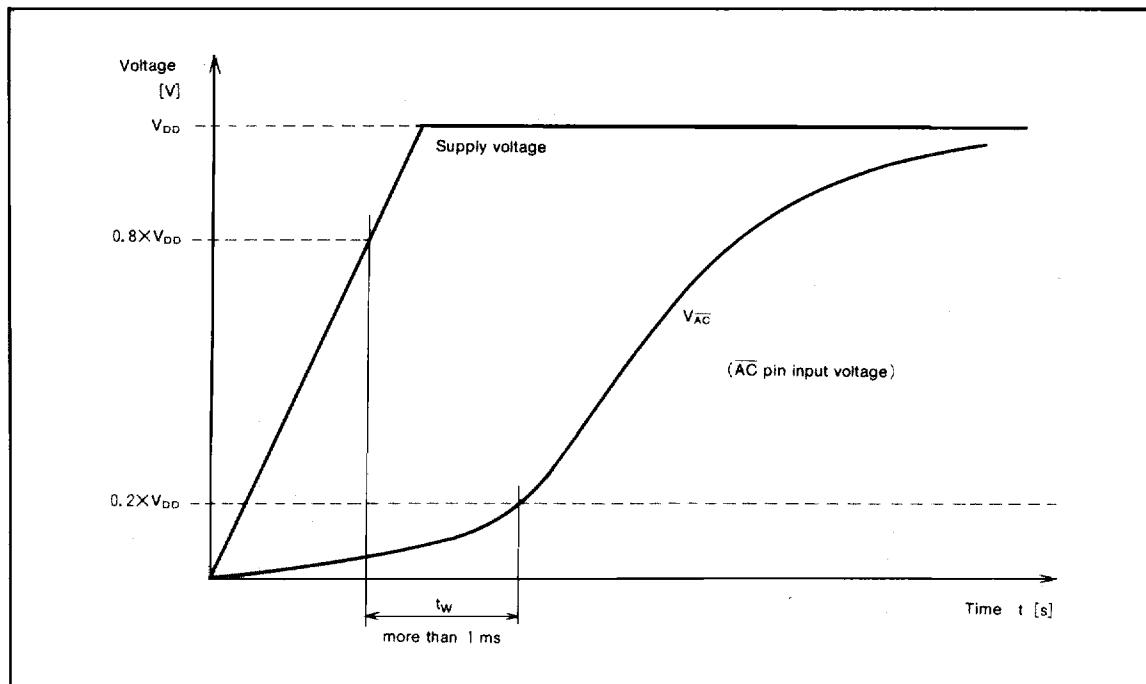

Fig. 16 Timing of power supplying to  $\overline{AC}$  pin

After supplying the power ( $V_{DD}$  and  $V_{SS}$ ) to M35012-XXXSP/M35013-XXXSP and the supply voltage becomes more than  $0.8 \times V_{DD}$ , it needs to keep  $V_{IL}$  time;  $t_w$  of the  $\overline{AC}$  pin for more than 1ms.

Power supply timing about  $V_{DD1}$  pin and  $V_{DD2}$  pin.

The power need to supply to  $V_{DD1}$  and  $V_{DD2}$  at a time, though it is separated perfectly between the  $V_{DD1}$  as the digital line and the  $V_{DD2}$  as the analog line.

**PRECAUTION FOR USE**

**Notes on noise and latch-up**

In order to avoid noise and latch-up, connect a bypass capacitor ( $\approx 0.1\mu F$ ) directly between the  $V_{DD}$  pin and  $V_{SS}$  pin using a heavy wire.

Ask your crystal oscillator manufacture to examine the matching conditions between this device and the crystal oscillator.
