### General Description

54LVTH162244 is a 16-bit buffer and line driver designed for low voltage operation with the capability to interface with a TTL environment. These devices can be used as four 4-bit buffers, two 8-bit buffers, or one 16-bit buffer. These devices provide true outputs and symmetrical active-low output-enable ( $\overline{OE}$ ) inputs. The outputs which are designed to source or sink up to 12ma, include equivalent 22 ohm series resistors to reduce overshoot and undershoot. Active bus-hold circuitry holds unused or undriven inputs at a valid logic state. Use of pullup or pulldown resistors with the bus-hold circuitry is not recommended.

DPACI incorporates radiation package shielding when required (based upon orbit requirements).

1. Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
2. The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.
3. This current flows only when the output is in the high state and  $V_O > V_{CC}$ .
4. All unused control inputs of the devices must be held at  $V_{CC}$  or GND to ensure proper device operation
