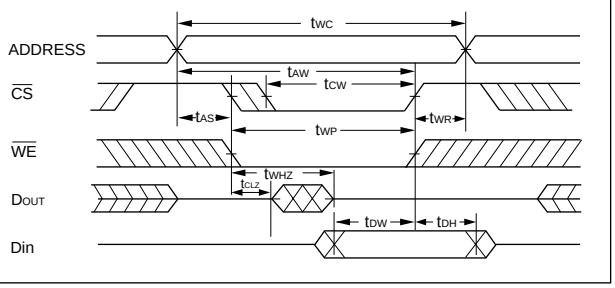
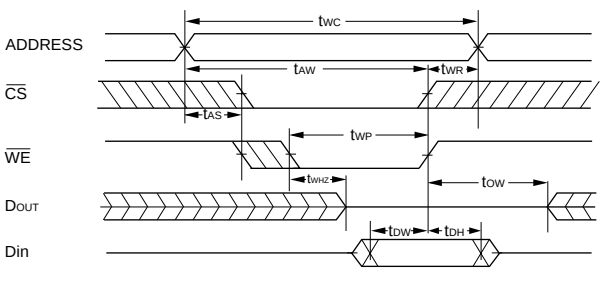
❍ Write Cycle (1)($\overline{CS}$ Control)*2



❍ Write Cycle (2)($\overline{WE}$ Control)*3, *4



Note :

* 1 During read cycle time, $\overline{WE}$ is to be "H" level.
* 2 During write cycle time that is controlled by $\overline{CS}$, Output Buffer is in high impedance state, whether $\overline{OE}$ level is "H" or "L".
* 3 During write cycle time that is controlled by $\overline{WE}$, Output Buffer is in high impedance state if $\overline{OE}$ is "H" level.
* 4 When I/O terminals are output mode, be careful that do not give the opposite signals to the terminals.

Note: During standby mode in which the data is retentive, the supply voltage (V_{DD}) can be in low voltage until V_{DD}=V_{DDR}.
At this mode data reading and writing are impossible.

■ FUNCTIONS

● Truth Table

$\overline{CS}$	$\overline{OE}$	$\overline{WE}$	DATA I/O	Mode	I_{DD}
H	X	X	Hi-Z	Standby	I_{DDS}, I_{DDS1}
L	X	L	D_{IN}	Write	I_{DDA}, I_{DDA1}
L	L	H	D_{OUT}	Read	I_{DDA}, I_{DDA1}
L	H	H	Hi-Z	Output disable	I_{DDA}, I_{DDA1}

X : "H" or "L", – "H", "L" or "Hi-Z"

● Read Mode

The data appear when the address is set while holding $\overline{CS}$="L" $\overline{OE}$="L" and $\overline{WE}$="H". When $\overline{OE}$="H", DATA I/O terminals are in high impedance state, that makes circuit design and bus control easy.

● Write Mode

There are the following 3 ways of writing data into memory.

(1) Hold $\overline{CS}$="L" and $\overline{WE}$="L", set address

(2) Hold $\overline{CS}$="L" then set address and give "L"pulse to $\overline{WE}$.

(3) After setting addresses, give "L"pulse to both $\overline{CS}$ and $\overline{WE}$.

In above any case data on the DATA I/O terminals are latched up into the chip when $\overline{CS}$ or $\overline{WE}$ is in positive-going. Since DATA I/O terminals are high impedance when $\overline{CS}$ or $\overline{OE}$="H", bus contention between data driver and memory outputs can be avoided.

● Standby Mode

When $\overline{CS}$ is "H" the chip become in the standby mode. In this mode, DATA I/O terminals are high impedance and all inputs of addresses, $\overline{WE}$ and data can be any "H"or "L". When $\overline{CS}$ is over than V_{DD}-0.2V, the chip is in the data retention battery backup mode, in this case, there is a small current in the chip which flow through the high resistances of the memory cells.
