1 Overview

This chapter gives an overview of the 1.8 V 240-Pin Unbuffered DDR2 SDRAM Modules product family and describes its main characteristics.

1.1 Features

- 240-Pin PC2–6400, PC2–5300, PC2–4200 and PC2–3200 DDR2 SDRAM memory modules for use as main memory when installed in systems such as mobile personal computers.
- 16M × 64, 32M × 64, 32M × 72, 64M × 64, 64M × 72 module organization and 16M × 16, 32M × 8 chip organization
- 128 MB, 256 MB and 512 MB modules built with 256-Mbit DDR2 SDRAMs in PG-TFBGA-60 and PG-TFBGA-84 chipsize packages
- Standard Double-Data-Rate-Two Synchronous DRAMs (DDR2 SDRAM) with a single + 1.8 V (± 0.1 V) power supply
- All Speed Grades faster than DDR2–400 comply with DDR2–400 timing specifications
- Programmable CAS Latencies (3, 4, 5 and 6), Burst Length (4 & 8) and Burst Type
- Auto Refresh (CBR) and Self Refresh
- Average Refresh Period 7.8 µs at a T_{CASE} lower than 85 °C, 3.9 µs between 85 °C and 95 °C
- Programmable self refresh rate via EMRS2 setting
- All inputs and outputs SSTL_18 compatible
- Off-Chip Driver Impedance Adjustment (OCD) and On-Die Termination (ODT)
- Serial Presence Detect with E^2PROM
- UDIMM Dimensions (nominal): 30 mm high, 133.35 mm wide
- Based on standard reference layouts Raw Card “A”, “C”, “D“, “E“, “F” and “G”
- RoHS compliant products[1)]

1) RoHS Compliant Product: Restriction of the use of certain hazardous substances (RoHS) in electrical and electronic equipment as defined in the directive 2002/95/EC issued by the European Parliament and of the Council of 27 January 2003. These substances include mercury, lead, cadmium, hexavalent chromium, polybrominated biphenyls and polybrominated biphenyl ethers.

1.2 Description

The QIMONDA HYS[64/72]T[16/32/64]0xxHU–[2.5/../5]–A module family are unbuffered DIMM modules “UDIMMs” with 30,0 mm height based on DDR2 technology. DIMMs are available as non-ECC modules in 16M × 64 (128MB), 32M × 64 (256MB), 64M × 64 (512MB) and as ECC modules in 32M × 72 (256MB), 64M × 72 (512MB) organization and density, intended for mounting into 240-pin connector sockets.

The memory array is designed with 256-Mbit Double-Data-Rate-Two (DDR2) Synchronous DRAMs. Decoupling capacitors are mounted on the PCB board. The DIMMs feature serial presence detect based on a serial E^2PROM device using the 2-pin I^2C protocol. The first 128 bytes are programmed with configuration data and are write protected; the second 128 bytes are available to the customer.

green Product

HYS72T32000HU–3.7–A	256MB 1Rx8 PC2–4200E–444–11–A1	1 Rank, ECC	256 Mbit (x8)
HYS64T64020HU–3.7–A	512MB 2Rx8 PC2–4200U–444–12–E1	2 Ranks, Non-ECC	256 Mbit (x8)

Product Type[1)]	Compliance Code[2)]	Description	SDRAM Technology
PC2–3200			
HYS64T16000HU–5–A	128MB 1Rx16 PC2–3200U–333–11–C1	1 Rank, Non-ECC	256 Mbit (x16)
HYS64T32001HU–5–A	256MB 1Rx8 PC2–3200U–333–11–A1	1 Rank, Non-ECC	256 Mbit (x8)
HYS72T32000HU–5–A	256MB 1Rx8 PC2–3200E–333–11–A1	1 Rank, ECC	256 Mbit (x8)

1) All product types end with a place code, designating the silicon die revision. Example: HYS64T16000HU–3.7–A, indicating Rev. “A” dies are used for DDR2 SDRAM components. For all QIMONDA DDR2 module and component nomenclature see **Chapter 6** of this data sheet.

2) The Compliance Code is printed on the module label and describes the speed grade, for example “PC2–4200U–444–11–C1”, where 4200U means Unbuffered DIMM modules with 4.26 GB/sec Module Bandwidth and “444-11” means Column Address Strobe (CAS) latency = 4, Row Column Delay (RCD) latency = 4 and Row Precharge (RP) latency = 4 using the latest JEDEC SPD Revision 1.1 and produced on the Raw Card “C”.

TABLE 3
Address Format

DIMM Density	Module Organization	Memory Ranks	ECC/ Non-ECC	# of SDRAMs	# of row/bank/column bits	Raw Card
128 MByte	16M × 64	1	Non-ECC	4	13/2/9	C
256 MByte	32M × 64	1	Non-ECC	8	13/2/10	A,D
	32M × 72	1	ECC	9	13/2/10	A,F
512 MByte	64M × 64	2	Non-ECC	16	13/2/10	E
	64M × 72	2	ECC	18	13/2/10	G

1) Green Product

2) For a detailed description of all functionalities of the DRAM components on these modules see the component data sheet.

2 Pin Configuration

The pin configuration of the Unbuffered DDR2 SDRAM DIMM is listed by function in **Table 5** (240 pins). The abbreviations used in columns Pin and Buffer Type are explained in **Table 6** and **Table 7** respectively. The pin numbering is depicted in **Figure 1** for non-ECC modules (×64) and **Figure 2** for ECC modules (×72).

Symbol	Parameter	Rating		Unit	Note
		Min.	Max.		
V_{DD}	Voltage on V_{DD} pin relative to V_{SS}	–1.0	+2.3	V	1)
V_{DDQ}	Voltage on V_{DDQ} pin relative to V_{SS}	–0.5	+2.3	V	1)2)
V_{DDL}	Voltage on V_{DDL} pin relative to V_{SS}	–0.5	+2.3	V	1)2)
V_{IN}, V_{OUT}	Voltage on any pin relative to V_{SS}	–0.5	+2.3	V	1)
T_{STG}	Storage Temperature	–55	+100	°C	1)2)

1) When V_{DD} and V_{DDQ} and V_{DDL} are less than 500 mV; V_{REF} may be equal to or less than 300 mV.
2) Storage Temperature is the case surface temperature on the center/top side of the DRAM.

Attention: Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

TABLE 9
DRAM Component Operating Temperature Range

Symbol	Parameter	Rating		Unit	Note
		Min.	Max.		
T_{OPER}	Operating Temperature	0	95	°C	1)2)3)4)

1) Operating Temperature is the case surface temperature on the center / top side of the DRAM.
2) The operating temperature range are the temperatures where all DRAM specification will be supported. During operation, the DRAM case temperature must be maintained between 0 - 95 °C under all other specification parameters.
3) Above 85 °C the Auto-Refresh command interval has to be reduced to t_{REFI}= 3.9 µs
4) When operating this product in the 85 °C to 95 °C TCASE temperature range, the High Temperature Self Refresh has to be enabled by setting EMR(2) bit A7 to "1". When the High Temperature Self Refresh is enabled there is an increase of I_{DD6} by approximately 50%

3.2 DC Operating Conditions

This chapter describes the DC operating characteristics.

TABLE 10
Operating Conditions

Parameter	Symbol	Values		Unit	Note
		Min.	Max.		
Operating temperature (ambient)	T_{OPR}	0	+65	°C	
DRAM Case Temperature	T_{CASE}	0	+95	°C	1)2)3)4)
Storage Temperature	T_{STG}	– 50	+100	°C	
Barometric Pressure (operating & storage)	PBar	+69	+105	kPa	5)
Operating Humidity (relative)	H_{OPR}	10	90	%	

1) DRAM Component Case Temperature is the surface temperature in the center on the top side of any of the DRAMs.
2) Within the DRAM Component Case Temperature Range all DRAM specifications will be supported
3) Above 85 °C DRAM Case Temperature the Auto-Refresh command interval has to be reduced to t_{REFI} = 3.9 µs
4) When operating this product in the 85 °C to 95 °C T_{CASE} temperature range, the High Temperature Self Refresh has to be enabled by setting EMR(2) bit A7 to “1”. When the High Temperature Self Refresh is enabled there is an increase of I_{DD6} by approximately 50%.
5) Up to 3000 m.

TABLE 11
Supply Voltage Levels and DC Operating Conditions

Parameter	Symbol	Values			Unit	Note
		Min.	Typ.	Max.		
Device Supply Voltage	V_{DD}	1.7	1.8	1.9	V	
Output Supply Voltage	V_{DDQ}	1.7	1.8	1.9	V	1)
Input Reference Voltage	V_{REF}	0.49 × V_{DDQ}	0.5 × V_{DDQ}	0.51 × V_{DDQ}	V	2)
SPD Supply Voltage	V_{DDSPD}	1.7	—	3.6	V	
DC Input Logic High	$V_{IH(DC)}$	V_{REF} + 0.125	—	V_{DDQ} + 0.3	V	
DC Input Logic Low	$V_{IL\ (DC)}$	– 0.30	—	V_{REF} – 0.125	V	
In / Output Leakage Current	I_L	– 5	—	5	µA	3)

1) Under all conditions, V_{DDQ} must be less than or equal to V_{DD}
2) Peak to peak AC noise on V_{REF} may not exceed ± 2% V_{REF} (DC). V_{REF} is also expected to track noise in V_{DDQ}.
3) Input voltage for any connector pin under test of 0 V ≤ V_{IN} ≤ V_{DDQ} + 0.3 V; all other pins at 0 V. Current is per pin

3.3 Timing Characteristics

This chapter describes the AC characteristics.

3.3.1 Speed Grade Definitions

All Speed grades faster than DDR2-DDR400B comply with DDR2-DDR400B timing specifications (t_{CK} = 5ns with t_{RAS} = 40ns). Speed Grade Definition for DDR2-800 (**Table 12**), DDR2-667(**Table 13**), DDR2-533C(**Table 14**) and DDR2-400B(**Table 15**).

TABLE 12
Speed Grade Definition Speed Bins for DDR2–800

Row Precharge Time		t_{RP}	12.5	—	15	—	ns	1)2)3)4)

1) Timings are guaranteed with CK/$\overline{CK}$ differential Slew Rate of 2.0 V/ns. For DQS signals timings are guaranteed with a differential Slew Rate of 2.0 V/ns in differential strobe mode and a Slew Rate of 1 V/ns in single ended mode. Timings are further guaranteed for normal OCD drive strength (EMRS(1) A1 = 0)
2) The CK/$\overline{CK}$ input reference level (for timing reference to CK/$\overline{CK}$) is the point at which CK and $\overline{CK}$ cross. The DQS / $\overline{DQS}$, RDQS / $\overline{RDQS}$, input reference level is the crosspoint when in differential strobe mode.
3) Inputs are not recognized as valid until V_{REF} stabilizes. During the period before V_{REF} stabilizes, CKE = 0.2 x V_{DDQ} is recognized as low.
4) The output timing reference voltage level is V_{TT}.
5) $t_{RAS.MAX}$ is calculated from the maximum amount of time a DDR2 device can operate without a refresh command which is equal to 9 x t_{REFI}.

Write preamble	t_{WPRE}	0.35	—	$t_{CK.AVG}$	
Address and control input setup time	$t_{IS.BASE}$	175	—	ps	22)23)
Address and control input hold time	$t_{IH.BASE}$	250	—	ps	23)24)
Read preamble	t_{RPRE}	0.9	1.1	$t_{CK.AVG}$	25)26)
Read postamble	t_{RPST}	0.4	0.6	$t_{CK.AVG}$	25)27)
CAS to CAS command delay	t_{CCD}	2	—	nCK	
Write recovery time	t_{WR}	15	—	ns	28)
Auto-Precharge write recovery + precharge time	t_{DAL}	WR + t_{nRP}	—	nCK	28)29)
Internal write to read command delay	t_{WTR}	7.5	—	ns	28)30)

Parameter	Symbol	DDR2–800		Unit	Note[1)2)3)4)5)6)7)8)]
		Min.	Max.		
Internal Read to Precharge command delay	t_{RTP}	7.5	—	ns	28)
Exit self-refresh to a non-read command	t_{XSNR}	t_{RFC} +10	—	ns	28)
Exit self-refresh to read command	t_{XSRD}	200	—	nCK	
Exit precharge power-down to any valid command (other than NOP or Deselect)	t_{XP}	2	—	nCK	
Exit power down to read command	t_{XARD}	2	—	nCK	
Exit active power-down mode to read command (slow exit, lower power)	t_{XARDS}	8 – AL	—	nCK	
CKE minimum pulse width (high and low pulse width)	t_{CKE}	3	—	nCK	31)
Mode register set command cycle time	t_{MRD}	2	—	nCK	
MRS command to ODT update delay	t_{MOD}	0	12	ns	28)
OCD drive mode output delay	t_{OIT}	0	12	ns	28)
Minimum time clocks remain ON after CKE asynchronously drops LOW	t_{DELAY}	t_{IS} + $t_{CK\ .AVG}$ + t_{IH}	—	ns	

1) For details and notes see the relevant Qimonda component data sheet
2) V_{DDQ} = 1.8 V ± 0.1V; V_{DD} = 1.8 V ± 0.1 V. See notes 5)6)7)8)
3) Timing that is not specified is illegal and after such an event, in order to guarantee proper operation, the DRAM must be powered down and then restarted through the specified initialization sequence before normal operation can continue.
4) Timings are guaranteed with CK/$\overline{CK}$ differential Slew Rate of 2.0 V/ns. For DQS signals timings are guaranteed with a differential Slew Rate of 2.0 V/ns in differential strobe mode and a Slew Rate of 1 V/ns in single ended mode.
5) The CK / $\overline{CK}$ input reference level (for timing reference to CK / $\overline{CK}$) is the point at which CK and $\overline{CK}$ cross. The DQS / $\overline{DQS}$, RDQS / $\overline{RDQS}$, input reference level is the crosspoint when in differential strobe mode.
6) Inputs are not recognized as valid until V_{REF} stabilizes. During the period before V_{REF} stabilizes, CKE = 0.2 x V_{DDQ} is recognized as low.
7) The output timing reference voltage level is V_{TT}.
8) New units, '$t_{CK.AVG}$' and 'nCK', are introduced in DDR2–667 and DDR2–800. Unit '$t_{CK.AVG}$' represents the actual $t_{CK.AVG}$ of the input clock under operation. Unit 'nCK' represents one clock cycle of the input clock, counting the actual clock edges. Note that in DDR2–400 and DDR2–533, 't_{CK}' is used for both concepts. Example: t_{XP} = 2 [nCK] means; if Power Down exit is registered at Tm, an Active command may be registered at Tm + 2, even if (Tm + 2 - Tm) is 2 x $t_{CK.AVG}$ + $t_{ERR.2PER(Min)}$.
9) When the device is operated with input clock jitter, this parameter needs to be derated by the actual $t_{ERR(6\text{-}10per)}$ of the input clock. (output deratings are relative to the SDRAM input clock.) For example, if the measured jitter into a DDR2–667 SDRAM has $t_{ERR(6\text{-}10PER).MIN}$ = – 272 ps and $t_{ERR(6\text{-}\ 10PER).MAX}$ = + 293 ps, then $t_{DQSCK.MIN(DERATED)}$ = $t_{DQSCK.MIN}$ – $t_{ERR(6\text{-}10PER).MAX}$ = – 400 ps – 293 ps = – 693 ps and $t_{DQSCK.MAX(DERATED)}$ = $t_{DQSCK.MAX}$ – $t_{ERR(6\text{-}10PER).MIN}$ = 400 ps + 272 ps = + 672 ps. Similarly, $t_{LZ.DQ}$ for DDR2–667 derates to $t_{LZ.DQ.MIN(DERATED)}$ = - 900 ps – 293 ps = – 1193 ps and $t_{LZ.DQ.MAX(DERATED)}$ = 450 ps + 272 ps = + 722 ps. (Caution on the MIN/MAX usage!)
10) Input clock jitter spec parameter. These parameters are referred to as 'input clock jitter spec parameters' and these parameters apply to DDR2–667 and DDR2–800 only. The jitter specified is a random jitter meeting a Gaussian distribution.
11) These parameters are specified per their average values, however it is understood that the relationship between the average timing and the absolute instantaneous timing holds all the times (min. and max of SPEC values are to be used for calculations).
12) Input waveform timing t_{DS} with differential data strobe enabled MR[bit10] = 0, is referenced from the input signal crossing at the $V_{IH.AC}$ level to the differential data strobe crosspoint for a rising signal, and from the input signal crossing at the $V_{IL.AC}$ level to the differential data strobe crosspoint for a falling signal applied to the device under test. DQS, DQS signals must be monotonic between $V_{il(DC)MAX}$ and $V_{ih(DC)MIN}$. See **Figure 4**.
13) If t_{DS} or t_{DH} is violated, data corruption may occur and the data must be re-written with valid data before a valid READ can be executed.
14) These parameters are measured from a data signal ((L/U)DM, (L/U)DQ0, (L/U)DQ1, etc.) transition edge to its respective data strobe signal ((L/U/R)DQS / $\overline{DQS}$) crossing.
15) Input waveform timing t_{DH} with differential data strobe enabled MR[bit10] = 0, is referenced from the differential data strobe crosspoint to the input signal crossing at the $V_{IH.DC}$ level for a falling signal and from the differential data strobe crosspoint to the input signal crossing at the $V_{IL.DC}$ level for a rising signal applied to the device under test. DQS, DQS signals must be monotonic between $V_{IL.DC.MAX}$ and $V_{IH.DC.MIN}$. See **Figure 4**.

16) t_{HZ} and t_{LZ} transitions occur in the same access time as valid data transitions. These parameters are referenced to a specific voltage level which specifies when the device output is no longer driving (t_{HZ}), or begins driving (t_{LZ}) .
17) t_{DQSQ}: Consists of data pin skew and output pattern effects, and p-channel to n-channel variation of the output drivers as well as output slew rate mismatch between DQS / $\overline{\text{DQS}}$ and associated DQ in any given cycle.
18) t_{HP} is the minimum of the absolute half period of the actual input clock. t_{HP} is an input parameter but not an input specification parameter. It is used in conjunction with t_{QHS} to derive the DRAM output timing t_{QH}. The value to be used for t_{QH} calculation is determined by the following equation; t_{HP} = MIN ($t_{CH.ABS}$, $t_{CL.ABS}$), where, $t_{CH.ABS}$ is the minimum of the actual instantaneous clock high time; $t_{CL.ABS}$ is the minimum of the actual instantaneous clock low time.
19) t_{QHS} accounts for: 1) The pulse duration distortion of on-chip clock circuits, which represents how well the actual t_{HP} at the input is transferred to the output; and 2) The worst case push-out of DQS on one transition followed by the worst case pull-in of DQ on the next transition, both of which are independent of each other, due to data pin skew, output pattern effects, and pchannel to n-channel variation of the output drivers.
20) $t_{QH} = t_{HP} - t_{QHS}$, where: t_{HP} is the minimum of the absolute half period of the actual input clock; and t_{QHS} is the specification value under the max column. {The less half-pulse width distortion present, the larger the t_{QH} value is; and the larger the valid data eye will be.} Examples: 1) If the system provides t_{HP} of 1315 ps into a DDR2–667 SDRAM, the DRAM provides t_{QH} of 975 ps minimum. 2) If the system provides t_{HP} of 1420 ps into a DDR2–667 SDRAM, the DRAM provides t_{QH} of 1080 ps minimum.
21) These parameters are measured from a data strobe signal ((L/U/R)DQS / $\overline{\text{DQS}}$) crossing to its respective clock signal (CK / $\overline{\text{CK}}$) crossing. The spec values are not affected by the amount of clock jitter applied (i.e. $t_{JIT.PER}$, $t_{JIT.CC}$, etc.), as these are relative to the clock signal crossing. That is, these parameters should be met whether clock jitter is present or not.
22) Input waveform timing is referenced from the input signal crossing at the $V_{IH.AC}$ level for a rising signal and $V_{IL.AC}$ for a falling signal applied to the device under test. See **Figure 5**.
23) These parameters are measured from a command/address signal (CKE, CS, RAS, CAS, WE, ODT, BA0, A0, A1, etc.) transition edge to its respective clock signal (CK / $\overline{\text{CK}}$) crossing. The spec values are not affected by the amount of clock jitter applied (i.e. $t_{JIT.PER}$, $t_{JIT.CC}$, etc.), as the setup and hold are relative to the clock signal crossing that latches the command/address. That is, these parameters should be met whether clock jitter is present or not.
24) Input waveform timing is referenced from the input signal crossing at the $V_{IL.DC}$ level for a rising signal and $V_{IH.DC}$ for a falling signal applied to the device under test. See **Figure 5**.
25) t_{RPST} end point and t_{RPRE} begin point are not referenced to a specific voltage level but specify when the device output is no longer driving (t_{RPST}), or begins driving (t_{RPRE}). **Figure 3** shows a method to calculate these points when the device is no longer driving (t_{RPST}), or begins driving (t_{RPRE}) by measuring the signal at two different voltages. The actual voltage measurement points are not critical as long as the calculation is consistent.
26) When the device is operated with input clock jitter, this parameter needs to be derated by the actual $t_{JIT.PER}$ of the input clock. (output deratings are relative to the SDRAM input clock.) For example, if the measured jitter into a DDR2–667 SDRAM has $t_{JIT.PER.MIN}$ = – 72 ps and $t_{JIT.PER.MAX}$ = + 93 ps, then $t_{RPRE.MIN(DERATED)} = t_{RPRE.MIN} + t_{JIT.PER.MIN} = 0.9 \times t_{CK.AVG} - 72$ ps = + 2178 ps and $t_{RPRE.MAX(DERATED)} = t_{RPRE.MAX} + t_{JIT.PER.MAX} = 1.1 \times t_{CK.AVG} + 93$ ps = + 2843 ps. (Caution on the MIN/MAX usage!).
27) When the device is operated with input clock jitter, this parameter needs to be derated by the actual $t_{JIT.DUTY}$ of the input clock. (output deratings are relative to the SDRAM input clock.) For example, if the measured jitter into a DDR2–667 SDRAM has $t_{JIT.DUTY.MIN}$ = – 72 ps and $t_{JIT.DUTY.MAX}$ = + 93 ps, then $t_{RPST.MIN(DERATED)} = t_{RPST.MIN} + t_{JIT.DUTY.MIN} = 0.4 \times t_{CK.AVG} - 72$ ps = + 928 ps and $t_{RPST.MAX(DERATED)} = t_{RPST.MAX} + t_{JIT.DUTY.MAX} = 0.6 \times t_{CK.AVG} + 93$ ps = + 1592 ps. (Caution on the MIN/MAX usage!).
28) DAL = WR + RU{t_{RP}(ns) / t_{CK}(ns)}, where RU stands for round up. WR refers to the tWR parameter stored in the MRS. For t_{RP}, if the result of the division is not already an integer, round up to the next highest integer. t_{CK} refers to the application clock period. Example: For DDR2–533 at t_{CK} = 3.75 ns with t_{WR} programmed to 4 clocks. t_{DAL} = 4 + (15 ns / 3.75 ns) clocks = 4 + (4) clocks = 8 clocks.
29) $t_{DAL.nCK}$ = WR [nCK] + $t_{nRP.nCK}$ = WR + RU{t_{RP} [ps] / $t_{CK.AVG}$[ps] }, where WR is the value programmed in the EMR.
30) t_{WTR} is at lease two clocks (2 x t_{CK}) independent of operation frequency.
31) $t_{CKE.MIN}$ of 3 clocks means CKE must be registered on three consecutive positive clock edges. CKE must remain at the valid input level the entire time it takes to achieve the 3 clocks of registration. Thus, after any CKE transition, CKE may not transition from its valid level during the time period of t_{IS} + 2 x t_{CK} + t_{IH}.

TABLE 17
DRAM Component Timing Parameter by Speed Grade - DDR2–667

Parameter	Symbol	DDR2–667		Unit	Note[1)2)3)4)5)6)7)8)]
		Min.	Max.		
DQ output access time from CK / $\overline{CK}$	t_{AC}	–450	+450	ps	9)

Mode register set command cycle time	t_{MRD}	2	—	nCK	
MRS command to ODT update delay	t_{MOD}	0	12	ns	28)
OCD drive mode output delay	t_{OIT}	0	12	ns	28)
Minimum time clocks remain ON after CKE asynchronously drops LOW	t_{DELAY}	t_{IS} + $t_{CK\ .AVG}$ + t_{IH}	—	ns	

1) For details and notes see the relevant Qimonda component data sheet
2) V_{DDQ} = 1.8 V ± 0.1V; V_{DD} = 1.8 V ± 0.1 V. See notes 5)6)7)8)
3) Timing that is not specified is illegal and after such an event, in order to guarantee proper operation, the DRAM must be powered down and then restarted through the specified initialization sequence before normal operation can continue.
4) Timings are guaranteed with CK/$\overline{CK}$ differential Slew Rate of 2.0 V/ns. For DQS signals timings are guaranteed with a differential Slew Rate of 2.0 V/ns in differential strobe mode and a Slew Rate of 1 V/ns in single ended mode.
5) The CK / $\overline{CK}$ input reference level (for timing reference to CK / $\overline{CK}$) is the point at which CK and $\overline{CK}$ cross. The DQS / $\overline{DQS}$, RDQS / $\overline{RDQS}$, input reference level is the crosspoint when in differential strobe mode.
6) Inputs are not recognized as valid until V_{REF} stabilizes. During the period before V_{REF} stabilizes, CKE = 0.2 x V_{DDQ} is recognized as low.
7) The output timing reference voltage level is V_{TT}.
8) New units, '$t_{CK.AVG}$' and 'nCK', are introduced in DDR2–667 and DDR2–800. Unit '$t_{CK.AVG}$' represents the actual $t_{CK.AVG}$ of the input clock under operation. Unit 'nCK' represents one clock cycle of the input clock, counting the actual clock edges. Note that in DDR2–400 and DDR2–533, 't_{CK}' is used for both concepts. Example: t_{XP} = 2 [nCK] means; if Power Down exit is registered at Tm, an Active command may be registered at Tm + 2, even if (Tm + 2 - Tm) is 2 x $t_{CK.AVG}$ + $t_{ERR.2PER(Min)}$.
9) When the device is operated with input clock jitter, this parameter needs to be derated by the actual $t_{ERR(6\text{-}10per)}$ of the input clock. (output deratings are relative to the SDRAM input clock.) For example, if the measured jitter into a DDR2–667 SDRAM has $t_{ERR(6\text{-}10PER).MIN}$ = – 272 ps and $t_{ERR(6\text{-}\ 10PER).MAX}$ = + 293 ps, then $t_{DQSCK.MIN(DERATED)}$ = $t_{DQSCK.MIN}$ – $t_{ERR(6\text{-}10PER).MAX}$ = – 400 ps – 293 ps = – 693 ps and $t_{DQSCK.MAX(DERATED)}$ = $t_{DQSCK.MAX}$ – $t_{ERR(6\text{-}10PER).MIN}$ = 400 ps + 272 ps = + 672 ps. Similarly, $t_{LZ.DQ}$ for DDR2–667 derates to $t_{LZ.DQ.MIN(DERATED)}$ = - 900 ps – 293 ps = – 1193 ps and $t_{LZ.DQ.MAX(DERATED)}$ = 450 ps + 272 ps = + 722 ps. (Caution on the MIN/MAX usage!)
10) Input clock jitter spec parameter. These parameters are referred to as 'input clock jitter spec parameters' and these parameters apply to DDR2–667 and DDR2–800 only. The jitter specified is a random jitter meeting a Gaussian distribution.
11) These parameters are specified per their average values, however it is understood that the relationship between the average timing and the absolute instantaneous timing holds all the times (min. and max of SPEC values are to be used for calculations).
12) Input waveform timing t_{DS} with differential data strobe enabled MR[bit10] = 0, is referenced from the input signal crossing at the $V_{IH.AC}$ level to the differential data strobe crosspoint for a rising signal, and from the input signal crossing at the $V_{IL.AC}$ level to the differential data strobe crosspoint for a falling signal applied to the device under test. DQS, DQS signals must be monotonic between $V_{il(DC)MAX}$ and $V_{ih(DC)MIN}$. See **Figure 4**.
13) If t_{DS} or t_{DH} is violated, data corruption may occur and the data must be re-written with valid data before a valid READ can be executed.
14) These parameters are measured from a data signal ((L/U)DM, (L/U)DQ0, (L/U)DQ1, etc.) transition edge to its respective data strobe signal ((L/U/R)DQS / $\overline{DQS}$) crossing.
15) Input waveform timing t_{DH} with differential data strobe enabled MR[bit10] = 0, is referenced from the differential data strobe crosspoint to the input signal crossing at the $V_{IH.DC}$ level for a falling signal and from the differential data strobe crosspoint to the input signal crossing at the $V_{IL.DC}$ level for a rising signal applied to the device under test. DQS, DQS signals must be monotonic between $V_{IL.DC.MAX}$ and $V_{IH.DC.MIN}$. See **Figure 4**.
16) t_{HZ} and t_{LZ} transitions occur in the same access time as valid data transitions. These parameters are referenced to a specific voltage level which specifies when the device output is no longer driving (t_{HZ}), or begins driving (t_{LZ}) .
17) t_{DQSQ}: Consists of data pin skew and output pattern effects, and p-channel to n-channel variation of the output drivers as well as output slew rate mismatch between DQS / $\overline{DQS}$ and associated DQ in any given cycle.

18) t_{HP} is the minimum of the absolute half period of the actual input clock. t_{HP} is an input parameter but not an input specification parameter. It is used in conjunction with t_{QHS} to derive the DRAM output timing t_{QH}. The value to be used for t_{QH} calculation is determined by the following equation; t_{HP} = MIN ($t_{CH.ABS}$, $t_{CL.ABS}$), where, $t_{CH.ABS}$ is the minimum of the actual instantaneous clock high time; $t_{CL.ABS}$ is the minimum of the actual instantaneous clock low time.

19) t_{QHS} accounts for: 1) The pulse duration distortion of on-chip clock circuits, which represents how well the actual t_{HP} at the input is transferred to the output; and 2) The worst case push-out of DQS on one transition followed by the worst case pull-in of DQ on the next transition, both of which are independent of each other, due to data pin skew, output pattern effects, and pchannel to n-channel variation of the output drivers.

20) t_{QH} = t_{HP} – t_{QHS}, where: t_{HP} is the minimum of the absolute half period of the actual input clock; and t_{QHS} is the specification value under the max column. {The less half-pulse width distortion present, the larger the t_{QH} value is; and the larger the valid data eye will be.} Examples: 1) If the system provides t_{HP} of 1315 ps into a DDR2–667 SDRAM, the DRAM provides t_{QH} of 975 ps minimum. 2) If the system provides t_{HP} of 1420 ps into a DDR2–667 SDRAM, the DRAM provides t_{QH} of 1080 ps minimum.

21) These parameters are measured from a data strobe signal ((L/U/R)DQS / $\overline{\text{DQS}}$) crossing to its respective clock signal (CK / $\overline{\text{CK}}$) crossing. The spec values are not affected by the amount of clock jitter applied (i.e. $t_{JIT.PER}$, $t_{JIT.CC}$, etc.), as these are relative to the clock signal crossing. That is, these parameters should be met whether clock jitter is present or not.

22) Input waveform timing is referenced from the input signal crossing at the $V_{IH.AC}$ level for a rising signal and $V_{IL.AC}$ for a falling signal applied to the device under test. See **Figure 5**.

23) These parameters are measured from a command/address signal (CKE, CS, RAS, CAS, WE, ODT, BA0, A0, A1, etc.) transition edge to its respective clock signal (CK / $\overline{\text{CK}}$) crossing. The spec values are not affected by the amount of clock jitter applied (i.e. $t_{JIT.PER}$, $t_{JIT.CC}$, etc.), as the setup and hold are relative to the clock signal crossing that latches the command/address. That is, these parameters should be met whether clock jitter is present or not.

24) Input waveform timing is referenced from the input signal crossing at the $V_{IL.DC}$ level for a rising signal and $V_{IH.DC}$ for a falling signal applied to the device under test. See **Figure 5**.

25) t_{RPST} end point and t_{RPRE} begin point are not referenced to a specific voltage level but specify when the device output is no longer driving (t_{RPST}), or begins driving (t_{RPRE}). **Figure 3** shows a method to calculate these points when the device is no longer driving (t_{RPST}), or begins driving (t_{RPRE}) by measuring the signal at two different voltages. The actual voltage measurement points are not critical as long as the calculation is consistent.

26) When the device is operated with input clock jitter, this parameter needs to be derated by the actual $t_{JIT.PER}$ of the input clock. (output deratings are relative to the SDRAM input clock.) For example, if the measured jitter into a DDR2–667 SDRAM has $t_{JIT.PER.MIN}$ = – 72 ps and $t_{JIT.PER.MAX}$ = + 93 ps, then $t_{RPRE.MIN(DERATED)}$ = $t_{RPRE.MIN}$ + $t_{JIT.PER.MIN}$ = 0.9 x $t_{CK.AVG}$ – 72 ps = + 2178 ps and $t_{RPRE.MAX(DERATED)}$ = $t_{RPRE.MAX}$ + $t_{JIT.PER.MAX}$ = 1.1 x $t_{CK.AVG}$ + 93 ps = + 2843 ps. (Caution on the MIN/MAX usage!).

27) When the device is operated with input clock jitter, this parameter needs to be derated by the actual $t_{JIT.DUTY}$ of the input clock. (output deratings are relative to the SDRAM input clock.) For example, if the measured jitter into a DDR2–667 SDRAM has $t_{JIT.DUTY.MIN}$ = – 72 ps and $t_{JIT.DUTY.MAX}$ = + 93 ps, then $t_{RPST.MIN(DERATED)}$ = $t_{RPST.MIN}$ + $t_{JIT.DUTY.MIN}$ = 0.4 x $t_{CK.AVG}$ – 72 ps = + 928 ps and $t_{RPST.MAX(DERATED)}$ = $t_{RPST.MAX}$ + $t_{JIT.DUTY.MAX}$ = 0.6 x $t_{CK.AVG}$ + 93 ps = + 1592 ps. (Caution on the MIN/MAX usage!).

28) DAL = WR + RU{t_{RP}(ns) / t_{CK}(ns)}, where RU stands for round up. WR refers to the tWR parameter stored in the MRS. For t_{RP}, if the result of the division is not already an integer, round up to the next highest integer. t_{CK} refers to the application clock period. Example: For DDR2–533 at t_{CK} = 3.75 ns with t_{WR} programmed to 4 clocks. t_{DAL} = 4 + (15 ns / 3.75 ns) clocks = 4 + (4) clocks = 8 clocks.

29) $t_{DAL.nCK}$ = WR [nCK] + $t_{nRP.nCK}$ = WR + RU{t_{RP} [ps] / $t_{CK.AVG}$[ps] }, where WR is the value programmed in the EMR.

30) t_{WTR} is at lease two clocks (2 x t_{CK}) independent of operation frequency.

31) $t_{CKE.MIN}$ of 3 clocks means CKE must be registered on three consecutive positive clock edges. CKE must remain at the valid input level the entire time it takes to achieve the 3 clocks of registration. Thus, after any CKE transition, CKE may not transition from its valid level during the time period of t_{IS} + 2 x t_{CK} + t_{IH}.

Exit Self-Refresh to Read command	t_{XSRD}	200	—	t_{CK}	

1) For details and notes see the relevant Qimonda component data sheet
2) V_{DDQ} = 1.8 V ± 0.1 V; V_{DD} = 1.8 V ±0.1 V. See notes 5)6)7)8)
3) Timing that is not specified is illegal and after such an event, in order to guarantee proper operation, the DRAM must be powered down and then restarted through the specified initialization sequence before normal operation can continue.
4) Timings are guaranteed with CK/$\overline{CK}$ differential Slew Rate of 2.0 V/ns. For DQS signals timings are guaranteed with a differential Slew Rate of 2.0 V/ns in differential strobe mode and a Slew Rate of 1 V/ns in single ended mode.
5) The CK / $\overline{CK}$ input reference level (for timing reference to CK / $\overline{CK}$) is the point at which CK and $\overline{CK}$ cross. The DQS / $\overline{DQS}$, RDQS/ $\overline{RDQS}$, input reference level is the crosspoint when in differential strobe mode.
6) Inputs are not recognized as valid until V_{REF} stabilizes. During the period before V_{REF} stabilizes, CKE = 0.2 x V_{DDQ} is recognized as low.
7) The output timing reference voltage level is V_{TT}.
8) For each of the terms, if not already an integer, round to the next highest integer. t_{CK} refers to the application clock period. WR refers to the WR parameter stored in the MR.
9) The clock frequency is allowed to change during self-refresh mode or precharge power-down mode.
10) For timing definition, refer to the Component data sheet.
11) Consists of data pin skew and output pattern effects, and p-channel to n-channel variation of the output drivers as well as output Slew Rate mis-match between DQS / $\overline{DQS}$ and associated DQ in any given cycle.
12) MIN (t_{CL}, t_{CH}) refers to the smaller of the actual clock low time and the actual clock high time as provided to the device (i.e. this value can be greater than the minimum specification limits for t_{CL} and t_{CH}).

13) The t_{HZ}, t_{RPST} and t_{LZ}, t_{RPRE} parameters are referenced to a specific voltage level, which specify when the device output is no longer driving (t_{HZ}, t_{RPST}), or begins driving (t_{LZ}, t_{RPRE}). t_{HZ} and t_{LZ} transitions occur in the same access time windows as valid data transitions.These parameters are verified by design and characterization, but not subject to production test.
14) The Auto-Refresh command interval has be reduced to 3.9 µs when operating the DDR2 DRAM in a temperature range between 85 °C and 95 °C.
15) 0 °C≤ T_{CASE} ≤ 85 °C
16) 85 °C < T_{CASE} ≤ 95 °C
17) A maximum of eight Auto-Refresh commands can be posted to any given DDR2 SDRAM device.
18) The t_{RRD} timing parameter depends on the page size of the DRAM organization. See **Table 2 "Ordering Information for RoHS Compliant Products" on Page 4**.
19) The maximum limit for the t_{WPST} parameter is not a device limit. The device operates with a greater value for this parameter, but system performance (bus turnaround) degrades accordingly.
20) WR must be programmed to fulfill the minimum requirement for the t_{WR} timing parameter, where WR_{MIN}[cycles] = t_{WR}(ns)/t_{CK}(ns) rounded up to the next integer value. t_{DAL} = WR + (t_{RP}/t_{CK}). For each of the terms, if not already an integer, round to the next highest integer. t_{CK} refers to the application clock period. WR refers to the WR parameter stored in the MRS.
21) Minimum t_{WTR} is two clocks when operating the DDR2-SDRAM at frequencies ≤ 200 MHz.
22) User can choose two different active power-down modes for additional power saving via MRS address bit A12. In "standard active power-down mode" (MR, A12 = "0") a fast power-down exit timing t_{XARD} can be used. In "low active power-down mode" (MR, A12 ="1") a slow power-down exit timing t_{XARDS} has to be satisfied.

TABLE 19
DRAM Component Timing Parameter by Speed Grade - DDR2-400

Parameter	Symbol	DDR2–400		Unit	Note[1)2)3)4)5)6)7)]
		Min.	Max.		
DQ output access time from CK / $\overline{CK}$	t_{AC}	–600	+600	ps

Exit Self-Refresh to Read command	t_{XSRD}	200	—	t_{CK}	

1) For details and notes see the relevant Qimonda component data sheet
2) V_{DDQ} = 1.8 V ± 0.1 V; V_{DD} = 1.8 V ±0.1 V. See notes 5)6)7)8)
3) Timing that is not specified is illegal and after such an event, in order to guarantee proper operation, the DRAM must be powered down and then restarted through the specified initialization sequence before normal operation can continue.
4) Timings are guaranteed with CK/$\overline{CK}$ differential Slew Rate of 2.0 V/ns. For DQS signals timings are guaranteed with a differential Slew Rate of 2.0 V/ns in differential strobe mode and a Slew Rate of 1 V/ns in single ended mode.
5) The CK / $\overline{CK}$ input reference level (for timing reference to CK / $\overline{CK}$) is the point at which CK and $\overline{CK}$ cross. The DQS / $\overline{DQS}$, RDQS/ $\overline{RDQS}$, input reference level is the crosspoint when in differential strobe mode.
6) Inputs are not recognized as valid until V_{REF} stabilizes. During the period before V_{REF} stabilizes, CKE = 0.2 x V_{DDQ} is recognized as low.
7) The output timing reference voltage level is V_{TT}.
8) For each of the terms, if not already an integer, round to the next highest integer. t_{CK} refers to the application clock period. WR refers to the WR parameter stored in the MR.
9) The clock frequency is allowed to change during self-refresh mode or precharge power-down mode.
10) For timing definition, refer to the Component data sheet.
11) Consists of data pin skew and output pattern effects, and p-channel to n-channel variation of the output drivers as well as output Slew Rate mis-match between DQS / $\overline{DQS}$ and associated DQ in any given cycle.
12) MIN (t_{CL}, t_{CH}) refers to the smaller of the actual clock low time and the actual clock high time as provided to the device (i.e. this value can be greater than the minimum specification limits for t_{CL} and t_{CH}).
13) The t_{HZ}, t_{RPST} and t_{LZ}, t_{RPRE} parameters are referenced to a specific voltage level, which specify when the device output is no longer driving ($t_{HZ,}$ t_{RPST}), or begins driving ($t_{LZ,}$ t_{RPRE}). t_{HZ} and t_{LZ} transitions occur in the same access time windows as valid data transitions.These parameters are verified by design and characterization, but not subject to production test.
14) The Auto-Refresh command interval has be reduced to 3.9 µs when operating the DDR2 DRAM in a temperature range between 85 °C and 95 °C.
15) 0 °C≤ T_{CASE} ≤ 85 °C
16) 85 °C < T_{CASE} ≤ 95 °C
17) A maximum of eight Auto-Refresh commands can be posted to any given DDR2 SDRAM device.
18) The t_{RRD} timing parameter depends on the page size of the DRAM organization. See **Table 2 “Ordering Information for RoHS Compliant Products” on Page 4**.
19) The maximum limit for the t_{WPST} parameter is not a device limit. The device operates with a greater value for this parameter, but system performance (bus turnaround) degrades accordingly.
20) WR must be programmed to fulfill the minimum requirement for the t_{WR} timing parameter, where WR_{MIN}[cycles] = t_{WR}(ns)/t_{CK}(ns) rounded up to the next integer value. t_{DAL} = WR + (t_{RP}/t_{CK}). For each of the terms, if not already an integer, round to the next highest integer. t_{CK} refers to the application clock period. WR refers to the WR parameter stored in the MRS.
21) Minimum t_{WTR} is two clocks when operating the DDR2-SDRAM at frequencies ≤ 200 MHz.
22) User can choose two different active power-down modes for additional power saving via MRS address bit A12. In “standard active power-down mode” (MR, A12 = “0”) a fast power-down exit timing t_{XARD} can be used. In “low active power-down mode” (MR, A12 =”1”) a slow power-down exit timing t_{XARDS} has to be satisfied.

3.3.3 ODT AC Electrical Characteristics

- **Table 20 “ODT AC Character. and Operating Conditions for DDR2-667 & DDR2-800” on Page 32**
- **Table 21 “ODT AC Character. and Operating Conditions for DDR2-533 & DDR2-400” on Page 33**

TABLE 20
ODT AC Character. and Operating Conditions for DDR2-667 & DDR2-800

Symbol	Parameter / Condition	Values		Unit	Note
		Min.	Max.		
t_{AOND}	ODT turn-on delay	2	2	nCK	1)
t_{AON}	ODT turn-on	$t_{AC.MIN}$	$t_{AC.MAX}$ + 0.7 ns	ns	1)2)
t_{AONPD}	ODT turn-on (Power-Down Modes)	$t_{AC.MIN}$ + 2 ns	2 t_{CK} + $t_{AC.MAX}$ + 1 ns	ns	1)
t_{AOFD}	ODT turn-off delay	2.5	2.5	nCK	1)
t_{AOF}	ODT turn-off	$t_{AC.MIN}$	$t_{AC.MAX}$ + 0.6 ns	ns	1)3)
t_{AOFPD}	ODT turn-off (Power-Down Modes)	$t_{AC.MIN}$ + 2 ns	2.5 t_{CK} + $t_{AC.MAX}$ + 1 ns	ns	1)
t_{ANPD}	ODT to Power Down Mode Entry Latency	3	—	nCK	1)
t_{AXPD}	ODT Power Down Exit Latency	8	—	nCK	1)

1) New units, '$t_{CK.AVG}$' and 'nCK', are introduced in DDR2-667 and DDR2-800. Unit '$t_{CK.AVG}$' represents the actual $t_{CK.AVG}$ of the input clock under operation. Unit 'nCK' represents one clock cycle of the input clock, counting the actual clock edges. Note that in DDR2-400 and DDR2-533, 't_{CK}' is used for both concepts. Example: t_{XP} = 2 [nCK] means; if Power Down exit is registered at Tm, an Active command may be registered at Tm + 2, even if (Tm + 2 - Tm) is 2 × $t_{CK.AVG}$+ $t_{EPR.2PER(MIN)}$.

2) ODT turn on time min is when the device leaves high impedance and ODT resistance begins to turn on. ODT turn on time max is when the ODT resistance is fully on. Both are measured from t_{AOND}, which is interpreted differently per speed bin. For DDR2-667/800, t_{AOND} is 2 clock cycles after the clock edge that registered a first ODT HIGH counting the actual input clock edges.

3) ODT turn off time min. is when the device starts to turn off ODT resistance. ODT turn off time max is when the bus is in high impedance. Both are measured from t_{AOFD}. Both are measured from t_{AOFD}, which is interpreted differently per speed bin. For DDR2-667/800,if $t_{CK.AVG}$ = 3 ns is assumed, t_{AOFD}= 1.5 ns (0.5 × 3 ns) after the second trailing clock edge counting from the clock edge that registered a first ODT LOW and by counting the actual input clock edge.

TABLE 21
ODT AC Character. and Operating Conditions for DDR2-533 & DDR2-400

Symbol	Parameter / Condition	Values		Unit	Note
		Min.	Max.		
t_{AOND}	ODT turn-on delay	2	2	t_{CK}	
t_{AON}	ODT turn-on	$t_{AC.MIN}$	$t_{AC.MAX}$ + 1 ns	ns	1)
t_{AONPD}	ODT turn-on (Power-Down Modes)	$t_{AC.MIN}$ + 2 ns	2 t_{CK} + $t_{AC.MAX}$ + 1 ns	ns	
t_{AOFD}	ODT turn-off delay	2.5	2.5	t_{CK}	
t_{AOF}	ODT turn-off	$t_{AC.MIN}$	$t_{AC.MAX}$ + 0.6 ns	ns	2)
t_{AOFPD}	ODT turn-off (Power-Down Modes)	$t_{AC.MIN}$ + 2 ns	2.5 t_{CK} + $t_{AC.MAX}$ + 1 ns	ns	
t_{ANPD}	ODT to Power Down Mode Entry Latency	3	—	t_{CK}	
t_{AXPD}	ODT Power Down Exit Latency	8	—	t_{CK}	

1) ODT turn on time min is when the device leaves high impedance and ODT resistance begins to turn on. ODT turn on time max is when the ODT resistance is fully on. Both are measured from t_{AOND}, which is interpreted differently per speed bin. For DDR2-400/533, t_{AOND} is 10 ns (= 2 x 5 ns) after the clock edge that registered a first ODT HIGH if t_{CK} = 5 ns.

2) ODT turn off time min. is when the device starts to turn off ODT resistance. ODT turn off time max is when the bus is in high impedance. Both are measured from t_{AOFD}. Both are measured from t_{AOFD}, which is interpreted differently per speed bin. For DDR2-400/533, t_{AOFD} is 12.5 ns (= 2.5 x 5 ns) after the clock edge that registered a first ODT HIGH if t_{CK} = 5 ns.

3.4 I_{DD} Specifications and Conditions

List of tables defining I_{DD} Specifications and Conditions.

TABLE 22
I_{DD} Measurement Conditions

Parameter	Symbol	Note 1)2)3)4)5)
Operating Current 0 One bank Active - Precharge; $t_{CK} = t_{CK.MIN}$, $t_{RC} = t_{RC.MIN}$, $t_{RAS} = t_{RAS.MIN}$, CKE is HIGH, $\overline{CS}$ is HIGH between valid commands. Address and control inputs are SWITCHING, Databus inputs are SWITCHING.	I_{DD0}	
Operating Current 1 One bank Active - Read - Precharge; I_{OUT} = 0 mA, BL = 4, $t_{CK} = t_{CK.MIN}$, $t_{RC} = t_{RC.MIN}$, $t_{RAS} = t_{RAS.MIN}$, $t_{RCD} = t_{RCD.MIN}$, AL = 0, CL = CL_{MIN}; CKE is HIGH, $\overline{CS}$ is HIGH between valid commands. Address and control inputs are SWITCHING, Databus inputs are SWITCHING.	I_{DD1}	6)
Precharge Standby Current All banks idle; $\overline{CS}$ is HIGH; CKE is HIGH; $t_{CK} = t_{CK.MIN}$; Other control and address inputs are SWITCHING, Databus inputs are SWITCHING.	I_{DD2N}	
Precharge Power-Down Current Other control and address inputs are STABLE, Data bus inputs are FLOATING.	I_{DD2P}	
Precharge Quiet Standby Current All banks idle; $\overline{CS}$ is HIGH; CKE is HIGH; $t_{CK} = t_{CK.MIN}$; Other control and address inputs are STABLE, Data bus inputs are FLOATING.	I_{DD2Q}	
Active Standby Current Burst Read: All banks open; Continuous burst reads; BL = 4; AL = 0, CL = CL_{MIN}; $t_{CK} = t_{CK.MIN}$; $t_{RAS} = t_{RAS.MAX}$, $t_{RP} = t_{RP.MIN}$; CKE is HIGH, $\overline{CS}$ is HIGH between valid commands. Address inputs are SWITCHING; Data Bus inputs are SWITCHING; I_{OUT} = 0 mA.	I_{DD3N}	
Active Power-Down Current All banks open; $t_{CK} = t_{CK.MIN}$, CKE is LOW; Other control and address inputs are STABLE, Data bus inputs are FLOATING. MRS A12 bit is set to LOW (Fast Power-down Exit);	$I_{DD3P(0)}$	
Active Power-Down Current All banks open; $t_{CK} = t_{CK.MIN}$, CKE is LOW; Other control and address inputs are STABLE, Data bus inputs are FLOATING. MRS A12 bit is set to HIGH (Slow Power-down Exit);	$I_{DD3P(1)}$	
Operating Current - Burst Read All banks open; Continuous burst reads; BL = 4; AL = 0, CL = CL_{MIN}; $t_{CK} = t_{CKMIN}$; $t_{RAS} = t_{RASMAX}$; $t_{RP} = t_{RPMIN}$; CKE is HIGH, CS is HIGH between valid commands; Address inputs are SWITCHING; Data bus inputs are SWITCHING; I_{OUT} = 0mA.	I_{DD4R}	6)
Operating Current - Burst Write All banks open; Continuous burst writes; BL = 4; AL = 0, CL = CL_{MIN}; $t_{CK} = t_{CK.MIN}$; $t_{RAS} = t_{RAS.MAX.}$, $t_{RP} = t_{RP.MAX}$; CKE is HIGH, $\overline{CS}$ is HIGH between valid commands. Address inputs are SWITCHING; Data Bus inputs are SWITCHING;	I_{DD4W}	
Burst Refresh Current $t_{CK} = t_{CK.MIN}$., Refresh command every $t_{RFC} = t_{RFC.MIN}$ interval, CKE is HIGH, $\overline{CS}$ is HIGH between valid commands, Other control and address inputs are SWITCHING, Data bus inputs are SWITCHING.	I_{DD5B}	

Parameter	Symbol	Note 1)2)3)4)5)
Distributed Refresh Current $t_{CK} = t_{CK.MIN.}$, Refresh command every $t_{RFC} = t_{REFI}$ interval, CKE is LOW and $\overline{CS}$ is HIGH between valid commands, Other control and address inputs are SWITCHING, Data bus inputs are SWITCHING.	I_{DD5D}	
Self-Refresh Current CKE ≤ 0.2 V; external clock off, CK and $\overline{CK}$ at 0 V; Other control and address inputs are FLOATING, Data bus inputs are FLOATING. I_{DD6} current values are guaranteed up to T_{CASE} of 85 °C max.	I_{DD6}	
All Bank Interleave Read Current All banks are being interleaved at minimum t_{RC} without violating t_{RRD} using a burst length of 4. Control and address bus inputs are STABLE during DESELECTS. I_{out} = 0 mA.	I_{DD7}	6)

1) V_{DDQ} = 1.8 V ± 0.1 V; V_{DD} = 1.8 V ± 0.1 V
2) I_{DD} specifications are tested after the device is properly initialized and I_{DD} parameter are specified with ODT disabled.
3) Definitions for I_{DD} see **Table 23**.
4) For two rank modules: for all active current measurements the other rank is in Precharge Power-Down Mode I_{DD2P}.
5) For details and notes see the relevant Qimonda component data sheet.
6) I_{DD1}, I_{DD4R} and I_{DD7} current measurements are defined with the outputs disabled (I_{OUT} = 0 mA). To achieve this on module level the output buffers can be disabled using an EMRS(1) (Extended Mode Register Command) by setting A12 bit to HIGH.

TABLE 23
Definitions for I_{DD}

Parameter	Description
LOW	$V_{IN} \leq V_{IL(ac).MAX}$, HIGH is defined as $V_{IN} \geq V_{IH(ac).MIN}$
STABLE	Inputs are stable at a HIGH or LOW level
FLOATING	Inputs are $V_{REF} = V_{DDQ}$ /2
SWITCHING	Inputs are changing between HIGH and LOW every other clock (once per 2 cycles) for address and control signals, and inputs changing between HIGH and LOW every other data transfer (once per cycle) for DQ signals not including mask or strobes

Symbol	Max.	Max.	Max.	Max.	Max.	Max.	Max.		
I_{DD0}	220	470	500	530	200	400	450	mA	2)
I_{DD1}	240	510	540	580	220	440	500	mA	2)
I_{DD2N}	140	560	320	630	110	220	250	mA	3)
I_{DD2P}	20	65	40	70	20	30	40	mA	3)
I_{DD2Q}	100	400	230	450	80	160	180	mA	3)
$I_{DD3P(\ MRS\ =\ 0)}$	60	260	140	290	50	100	120	mA	3)
$I_{DD3P(\ MRS\ =\ 1)}$	20	65	40	70	20	30	40	mA	3)
I_{DD3N}	140	560	320	630	120	240	270	mA	3)
I_{DD4R}	320	590	630	670	280	480	540	mA	2)
I_{DD4W}	400	710	770	800	360	560	630	mA	2)
I_{DD5B}	340	710	770	800	320	640	720	mA	2)
I_{DD5D}	20	100	50	110	20	50	50	mA	3)4)
I_{DD6}	16	64	36	72	16	32	36	mA	3)4)
I_{DD7}	600	1110	1220	1250	560	1000	1130	mA	2)

1) Calculated values from component data. ODT disabled. I_{DD1}, I_{DD4R} and I_{DD7} are defined with the outputs disabled.
2) The other rank is in I_{DD2P} Precharge Power-Down Current mode.
3) Both ranks are in the same I_{DD} current mode.
4) I_{DD5D} and I_{DD6} values are for 0 °C ≤ T_{Case} ≤ 85 °C.

4 SPD Codes

This chapter lists all hexadecimal byte values stored in the EEPROM of the products described in this data sheet. SPD stands for serial presence detect. All values with XX in the table are module specific bytes which are defined during production.

List of SPD Code Tables

TABLE 27
SPD Codes for PC2–6400[U/E]–666

Product Type		HYS64T32001HU–2.5–A	HYS64T64020HU–2.5–A	HYS72T32000HU–2.5–A	HYS72T64020HU–2.5–A
Organization		256MB	512MB	256MB	512MB
		×64	×64	×72	×72
		1 Rank (×8)	2 Ranks (×8)	1 Rank (×8)	2 Ranks (×8)
Label Code		PC2–6400U–666	PC2–6400U–666	PC2–6400E–666	PC2–6400E–666

6 Product Type Nomenclature

Qimonda's nomenclature uses simple coding combined with some propriatory coding. **Table 33** provides examples for module and component product type number as well as the field number. The detailed field description together with possible values and coding explanation is listed for modules in **Table 34** and for components in **Table 35**.

TABLE 33
Nomenclature Fields and Examples

Example for	Field Number										
	1	2	3	4	5	6	7	8	9	10	11
Micro-DIMM	HYS	64	T	64/128	0	2	0	K	M	–5	–A
DDR2 DRAM	HYB	18	T	512/1G	16		0	A	C	–5	

TABLE 34
DDR2 DIMM Nomenclature

Field	Description	Values	Coding
1	Qimonda Module Prefix	HYS	Constant
2	Module Data Width [bit]	64	Non-ECC
		72	ECC
3	DRAM Technology	T	DDR2
4	Memory Density per I/O [Mbit]; Module Density[1)]	32	256 MByte
		64	512 MByte
		128	1 GByte
		256	2 GByte
		512	4 GByte
5	Raw Card Generation	0 .. 9	Look up table
6	Number of Module Ranks	0, 2, 4	1, 2, 4
7	Product Variations	0 .. 9	Look up table
8	Package, Lead-Free Status	A .. Z	Look up table
9	Module Type	D	SO-**D**IMM
		M	**M**icro-DIMM
		R	**R**egistered
		U	**U**nbuffered
		F	**F**ully Buffered

Field	Description	Values	Coding
10	Speed Grade	–2.5F	PC2–6400 5–5–5
		–2.5	PC2–6400 6–6–6
		–3	PC2–5300 4–4–4
		–3S	PC2–5300 5–5–5
		–3.7	PC2–4200 4–4–4
		–5	PC2–3200 3–3–3
11	Die Revision	–A	First
		–B	Second

1) Multiplying “Memory Density per I/O” with “Module Data Width” and dividing by 8 for Non-ECC and 9 for ECC modules gives the overall module memory density in MBytes as listed in column “Coding”.

TABLE 35
DDR2 DRAM Nomenclature

Field	Description	Values	Coding
1	Qimonda Component Prefix	HYB	Constant
2	Interface Voltage [V]	18	SSTL_18
3	DRAM Technology	T	DDR2
4	Component Density [Mbit]	256	256 Mbit
		512	512 Mbit
		1G	1 Gbit
		2G	2 Gbit
5+6	Number of I/Os	40	×4
		80	×8
		16	×16
7	Product Variations	0 .. 9	Look up table
8	Die Revision	A	First
		B	Second
9	Package, Lead-Free Status	C	FBGA, lead-containing
		F	FBGA, lead-free
10	Speed Grade	–25F	DDR2-800 5-5-5
		–2.5	DDR2-800 6-6-6
		–3	DDR2-667 4-4-4
		–3S	DDR2-667 5-5-5
		–3.7	DDR2-533 4-4-4
		–5	DDR2-400 3-3-3

Warnings

Due to technical requirements components may contain dangerous substances. For information on the types in question please contact your nearest Qimonda Office.
Qimonda Components may only be used in life-support devices or systems with the express written approval of Qimonda, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system, or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body, or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.
