

# Low-Saturation 1000mA Regulators Monolithic IC MM170□□ Series

## Outline

This IC is a small stabilized power supply IC that provides output voltage accuracy of  $\pm 2\%$ , output current of 1000mA (max.), and dropout voltage of 0.18V typ. with 1000mA. It also has an output noise reduction pin and output ON/OFF control pin (HSOP-8A). It is available in the TO-252A package in addition to HSOP-8A considering heat radiation.

## Features

- |                                  |                                    |
|----------------------------------|------------------------------------|
| 1. Current consumption (no load) | 1mA typ.                           |
| 2. High accuracy output voltage  | $\pm 2.0\%$                        |
| 3. Dropout voltage               | 0.18V typ. ( $I_o=1000\text{mA}$ ) |
| 4. High ripple rejection         | 65dB typ.                          |
| 5. Operating temperature range   | -40 to +85°C                       |
| 6. Output voltage                | 0.9 to 2.0V (0.1V steps)           |
| 7. Output capacitor              | 1 $\mu\text{F}$ (Ceramic)          |

## Pin Description (HSOP-8A)

Pin No.	Pin name	Function	Internal equivalent circuit diagram						
1	V <sub>OUT</sub>	Output pin  The capacitor must be connected with the output pin more than 1μF.							
2	NC	No connection							
3	GND	Ground							
4	C <sub>n</sub>	Noise decrease pin  Connecting with the 0.01μF capacitor can decrease output noise. If the capacitor is not connected, the pin may be influenced by outside noise.							
5	CONT	Control pin  <table border="1" data-bbox="515 1042 817 1177"> <tr> <th>CONT</th><th>Output</th></tr> <tr> <td>H</td><td>ON</td></tr> <tr> <td>L</td><td>OFF</td></tr> </table>	CONT	Output	H	ON	L	OFF

### Note

1. The output capacitor is required between output and GND to prevent oscillation.
2. The output capacitor must be used in ESR stable area.
3. The wire of V<sub>cc</sub> and GND is required to print full ground plane for noise and stability.
4. The input capacitor must be connected in 1cm from input pin.
5. The capacitor is connected to C<sub>n</sub> must have low leakage current characteristics, because C<sub>n</sub> pin is high impedance.
6. In case the output voltage is above the input voltage, the overcurrent flows by internal parasitic diode from output to input. In such application, the external bypass diode must be connected between the output pin and the input pin.

## Power Dissipation

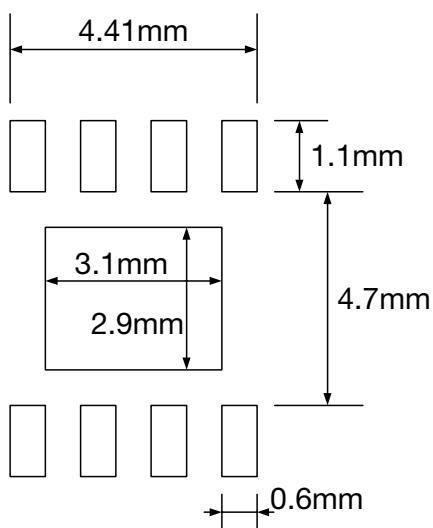

This IC's GND pin and the Heat Spreader Bottom effectively radiate heat. By increasing these copper foil pattern area of PCB, power dissipation improves. Please kindly design PCB pattern taking care of above features about the power dissipation.
