Notes :

1. Contrast Ratio(CR) is defined mathematically as :

$$\text{Contrast Ratio} = \frac{\text{Surface Luminance with all white pixels}}{\text{Surface Luminance with all black pixels}}$$

2. Surface luminance is the center point across the LCD surface 500mm from the surface with all pixels displaying white. For more information see FIG 1.

3. Response time is the time required for the display to transition from to black(Rise Time, TrR) and from black to white(Decay Time, TrD). For additional information see FIG 3.

4. Viewing angle is the angle at which the contrast ratio is greater than 10. The angles are determined for the horizontal or x axis and the vertical or y axis with respect to the z axis which

is normal to the LCD surface. For more information see FIG 5.

5. Optimum contrast is obtained by adjusting the LCD Threshold voltage(Vth & Vsat)

FIG. 1 Optical Characteristic Measurement Equipment and Method

FIG. 2 The definition of V_{th} and V_{sat}

FIG. 3 The definition of Response Time

The response time is defined as the following figure and shall be measured by switching the input signal for “black” and “white”.

8.Backlight:

8.1 Standard Lamp Styles (Edge Lighting Type):

The LED chips are distributed over the edge light area of the illumination unit, which gives the less power consumption:

8.2 The Main Advantages of the LED Backlight are as Following:

The brightness of the backlight can simply be adjusted.

By a resistor or a potentiometer.

8.3 Data About LED Backlight:

Item	Symbol	Conditions	Min.	Typ.	Max.	Unit	
Forward Voltage	Vf	If =72	-	3.2	3.5	V	
Forward Current	If		-	72		mA	
Uniformity	-	If=72	80%	-	-	-	
Luminous Color	-	White					
Chip Connection	-	4-LED parallel connection

- 1.Backlight Only
- 2.Average Luminous Intensity of P1-P9
- 3.Uniformity = $\text{Min}(P1 \sim P9) / \text{Max}(P1 \sim P9) * 100\% > 80\%$
