Integrated Microprocessor Supervisory Module with Lithium Backup Battery

MAX1691

General Description

The MAX1691 reduces the complexity and number of components required for power-supply monitoring and battery control functions in microprocessor (μ P) systems. The MAX1691 features switchover to internal backup battery, write protection of CMOS RAM or EEPROM, and watchdog function.

The internal +3V 125mAh lithium battery connects to the μ P supervisory circuit through external pin strapping, minimizing battery drain during shipping.

The MAX1691 is shipped in special nonconductive material. **Note:** Storing the MAX1691 in conductive foam will discharge the internal battery.

ELECTRICAL CHARACTERISTICS (continued)

(V_{CC} = 4.75V to 5.5V, $V_{BATT\ IN}$ = +2.8V applied externally, T_A = T_{MIN} to T_{MAX} , unless otherwise noted. Typical values are at 25°C.)

PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS

Note 1: See *Typical Operating Characteristics*.

Note 2: The supply current drawn from the battery excluding I_{OUT} typically goes to 18 μA when $(V_{BATT\ IN} - 1V) < V_{CC} < V_{BATT\ IN}$. In most applications, this is a brief period as V_{CC} falls through this region.

Note 3: "+" = battery-discharging current, "-" = battery-charging current.

Note 4: RESET is an open-drain output and sinks current only.

Note 5: WDI is internally connected to a voltage divider between V_{OUT} and GND. If unconnected, WDI is driven to 1.6V (typ), disabling the watchdog function.

Note 6: The chip-enable resistance is tested with V_{CC} = 4.75V. $V_{CE\ IN} = V_{CE\ OUT} = V_{CC}/2$.

Note 7: The chip-enable propagation delay is measured from the 50% point at \overline{CE} IN to the 50% point at \overline{CE} OUT.

Typical Operating Characteristics

($V_{BATT\ IN}$ = 2.8V externally applied, V_{CC} = 5.0V, T_A = +25°C, unless otherwise noted).
