GENERAL DESCRIPTION

The K4S280432I / K4S280832I / K4S281632I is 134,217,728 bits synchronous high data rate Dynamic RAM organized as 4 x 8,388,608 words by 4 bits / 4 x 4,194,304 words by 8 bits / 4 x 2,097,152 words by 16 bits, fabricated with SAMSUNG's high performance CMOS technology. Synchronous design allows precise cycle control with the use of system clock I/O transactions are possible on every clock cycle. Range of operating frequencies, programmable burst length and programmable latencies allow the same device to be useful for a variety of high bandwidth, high performance memory system applications.

## PIN FUNCTION DESCRIPTION

Pin	Name	Input Function
CLK	System clock	Active on the positive going edge to sample all inputs.
<u>CS</u>	Chip select	Disables or enables device operation by masking or enabling all inputs except CLK, CKE and DQM
CKE	Clock enable	Masks system clock to freeze operation from the next clock cycle. CKE should be enabled at least one cycle prior to new command. Disable input buffers for power down in standby.
A0 ~ A11	Address	Row/column addresses are multiplexed on the same pins. Row address : RA0 ~ RA11, Column address : (x4 : CA0 ~ CA9,CA11), (x8 : CA0 ~ CA9), (x16 : CA0 ~ CA8)
BA0 ~ BA1	Bank select address	Selects bank to be activated during row address latch time. Selects bank for read/write during column address latch time.
<u>RAS</u>	Row address strobe	Latches row addresses on the positive going edge of the CLK with <u>RAS</u> low. Enables row access & precharge.
<u>CAS</u>	Column address strobe	Latches column addresses on the positive going edge of the CLK with <u>CAS</u> low. Enables column access.
<u>WE</u>	Write enable	Enables write operation and row precharge. Latches data in starting from CAS, <u>WE</u> active.
DQM	Data input/output mask	Makes data output Hi-Z, t <sub>SHZ</sub> after the clock and masks the output. Blocks data input when DQM active.
DQ0 ~ N	Data input/output	Data inputs/outputs are multiplexed on the same pins. (x4 : DQ0 ~ 3), (x8 : DQ0 ~ 7), (x16 : DQ0 ~ 15)
V <sub>DD</sub> /V <sub>SS</sub>	Power supply/ground	Power and ground for the input buffers and the core logic.
V <sub>DDQ</sub> /V <sub>SSQ</sub>	Data output power/ground	Isolated power supply and ground for the output buffers to provide improved noise immunity.
N.C/RFU	No connection /reserved for future use	This pin is recommended to be left No Connection on the device.

## ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Value	Unit
Voltage on any pin relative to V <sub>SS</sub>	V <sub>IN</sub> , V <sub>OUT</sub>	-1.0 ~ 4.6	V
Voltage on V <sub>DD</sub> supply relative to V <sub>SS</sub>	V <sub>DD</sub> , V <sub>DDQ</sub>	-1.0 ~ 4.6	V
Storage temperature	T <sub>STG</sub>	-55 ~ +150	°C

**Note** : Permanent device damage may occur if "ABSOLUTE MAXIMUM RATINGS" are exceeded.

Functional operation should be restricted to recommended operating condition.

Exposure to higher than recommended voltage for extended periods of time could affect device reliability.

Number of valid output data	CAS latency=3	2			ea	4
	CAS latency=2	-		1		

- Notes :**
- The minimum number of clock cycles is determined by dividing the minimum time required with clock cycle time and then rounding off to the next higher integer.
  - Minimum delay is required to complete write.
  - All parts allow every cycle column address change.
  - In case of row precharge interrupt, auto precharge and read burst stop.
  - In 100MHz and below 100MHz operating conditions,  $t_{RDL}=1CLK$  and  $t_{DAL}=1CLK + 20ns$  is also supported. SAMSUNG recommends  $t_{RDL}=2CLK$  and  $t_{DAL}=2CLK + t_{RP}$ .
  - $t_{RC} = t_{RFC}$ ,  $t_{RDL} = t_{WR}$ .

**Notes :** 1. Parameters depend on programmed CAS latency.

2. If clock rising time is longer than 1ns,  $(tr/2-0.5)$ ns should be added to the parameter.

3. Assumed input rise and fall time ( $tr$  &  $tf$ ) = 1ns.

If  $tr$  &  $tf$  is longer than 1ns, transient time compensation should be considered,

i.e.,  $[(tr + tf)/2-1]$ ns should be added to the parameter.

4. tss applies for address setup time, clock enable setup time, command setup time and data setup time

tsh applies for address hold time, clock enable hold time, command hold time and data hold time

**Notes :** 1. OP Code : Operand code

A0 ~ A11 &amp; BA0 ~ BA1 : Program keys. (@ MRS)

2. MRS can be issued only at all banks precharge state.

A new command can be issued after 2 CLK cycles of MRS.

3. Auto refresh functions are as same as CBR refresh of DRAM.

The automatical precharge without row precharge command is meant by "Auto".

Auto/self refresh can be issued only at all banks precharge state.

4. BA0 ~ BA1 : Bank select addresses.

If both BA0 and BA1 are "Low" at read, write, row active and precharge, bank A is selected.

If BA0 is "High" and BA1 is "Low" at read, write, row active and precharge, bank B is selected.

If BA0 is "Low" and BA1 is "High" at read, write, row active and precharge, bank C is selected.

If both BA0 and BA1 are "High" at read, write, row active and precharge, bank D is selected.

If A10/AP is "High" at row precharge, BA0 and BA1 is ignored and all banks are selected.

5. During burst read or write with auto precharge, new read/write command can not be issued.

Another bank read/write command can be issued after the end of burst.

New row active of the associated bank can be issued at TRP after the end of burst.

6. Burst stop command is valid at every burst length.

7. DQM sampled at positive going edge of a CLK and masks the data-in at the very CLK (Write DQM latency is 0), but makes Hi-Z state the data-out of 2 CLK cycles after. (Read DQM latency is 2)
