µP Supervisory Circuits in 4-Bump (1mm x 1mm) Chip-Scale Package

MAX16072/MAX16073/MAX16074

General Description

The MAX16072/MAX16073/MAX16074 ultra-small, ultra-low-power, microprocessor (µP) supervisory circuits feature a precision band-gap reference, comparator, and internally trimmed resistors that set the threshold voltage. Designed to monitor the system supply voltage and assert an output during power-up, power-down, and brownout conditions, these devices provide excellent circuit reliability and low cost by eliminating external components and adjustments when monitoring nominal system voltage from 1.8V to 3.6V.
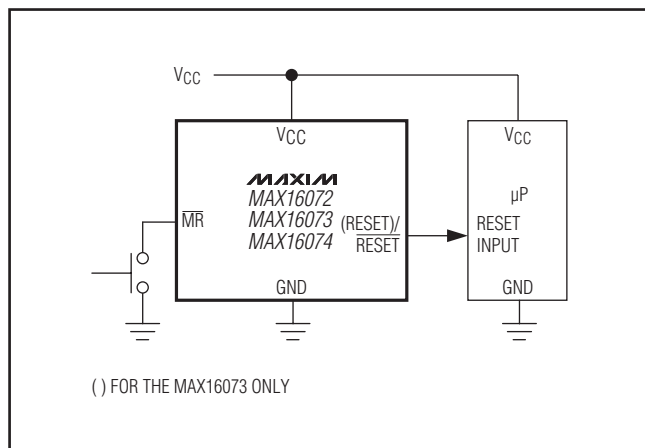

The MAX16072 has a push-pull, active-low reset output, the MAX16073 has a push-pull, active-high reset output, and the MAX16074 has an open-drain active-low reset output. The devices are designed to ignore fast transients on V_{CC}. The devices also include a manual reset input ($\overline{MR}$).

The MAX16072/MAX16073/MAX16074 are available in a 1mm x 1mm, space-saving, 4-bump, chip-scale package (UCSP™).

Applications

Portable/Battery-Powered Equipment

Cell Phones

PDAs

MP3 Players

Digital Cameras

Features

♦ **Ultra-Low, 0.7µA Supply Current**

♦ **Ultra-Small (1mm x 1mm), 4-Bump UCSP**

♦ **20µs, 8ms, 34ms, and 140ms Reset Timeout Options Available**

♦ **Factory-Trimmed Reset Thresholds Available from 1.58V to 3.08V in Approximately 100mV Increments**

♦ **±2.5% Threshold Accuracy Over Temperature**

♦ **Manual Reset Input**

♦ **Guaranteed Reset Valid to V_{CC} = 1.0V**

♦ **Immune to Short V_{CC} Transient**

Ordering Information

PART	RESET OUTPUT TYPE	PIN-PACKAGE
MAX16072RS_ _D_+	Push-Pull, Active-Low	4 UCSP
MAX16073RS_ _D_+	Push-Pull, Active-High	4 UCSP
MAX16074RS_ _D_+	Open-Drain, Active-Low	4 UCSP

Note: All devices are specified over the -40°C to +85°C operating temperature range.

Insert the desired suffix numbers (from Table 1) into the blanks "RS_ _D" to indicate the reset trip threshold. Insert the desired suffix number (from Table 2) into the blank "D_+" to indicate the reset timeout. Minimum order quantity may apply.

+Denotes a lead(Pb)-free/RoHS-compliant package.

µP Supervisory Circuits in 4-Bump (1mm x 1mm) Chip-Scale Package

MAX16072/MAX16073/MAX16074 *(vertical left margin)*

ABSOLUTE MAXIMUM RATINGS

(Voltages referenced to GND.)
V_{CC}, $\overline{MR}$ ....-0.3V to +6V
RESET, $\overline{RESET}$ Push-Pull .... -0.3V to (V_{CC} + 0.3V)
$\overline{RESET}$ Open-Drain...-0.3V to +6V
Output Current (all pins) .... ±20mA
Continuous Power Dissipation (T_A = +70°C)
  4-Bump UCSP (derate 3mW/°C above +70°C) 239mW

Operating Temperature Range ....-40°C to +85°C
Storage Temperature Range...........................-65°C to +150°C
Junction Temperature ....+150°C
Soldering Temperature (reflow) ....+260°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V_{CC} = 1.5V to 2.75V, T_A = -40°C to +85°C, unless otherwise noted. Typical values are at T_A = +25°C and V_{CC} = 3.6V.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS		MIN	TYP	MAX	UNITS
Operating Voltage Range	V_{CC}	T_A = 0°C to +85°C		1.0		5.5	V

Bump Description

BUMP			NAME	FUNCTION
MAX16072	MAX16073	MAX16074		
A1	A1	A1	GND	Ground
B1	—	—	$\overline{RESET}$	Active-Low Push-Pull Reset Output. $\overline{RESET}$ changes from high to low when V_{CC} drops below the detector threshold (V_{TH}) or $\overline{MR}$ is pulled low. $\overline{RESET}$ remains low for the reset timeout period after V_{CC} exceeds V_{TH} and $\overline{MR}$ is high. When $\overline{MR}$ is low, $\overline{RESET}$ is low.
—	B1	—	RESET	Active-High Push-Pull Reset Output. $\overline{RESET}$ changes from low to high when V_{CC} drops below the detector threshold (V_{TH}) or $\overline{MR}$ is pulled low. $\overline{RESET}$ remains high for the reset timeout period after V_{CC} exceeds V_{TH} and $\overline{MR}$ is high. When $\overline{MR}$ is low, $\overline{RESET}$ is high.
—	—	B1	$\overline{RESET}$	Active-Low Open-Drain Reset Output. $\overline{RESET}$ changes from high-impedance to active-low when V_{CC} drops below the detector threshold (V_{TH}) or $\overline{MR}$ is pulled low. $\overline{RESET}$ remains low for the reset timeout period after V_{CC} exceeds the reset threshold and $\overline{MR}$ is high. When $\overline{MR}$ is low, $\overline{RESET}$ is low.
A2	A2	A2	V_{CC}	Supply Voltage and Input for the Reset Threshold Monitor
B2	B2	B2	$\overline{MR}$	Active-Low Manual-Reset Input. Drive low to force a reset. Reset remains active as long as $\overline{MR}$ is low and for the reset timeout period (if applicable) after $\overline{MR}$ is driven high. $\overline{MR}$ has an internal pullup resistor connected to V_{CC}, and may be left unconnected if not used.

MAX16074

Detailed Description

The MAX16072/MAX16073/MAX16074 ultra-small, ultra-low-power, µP supervisory circuits feature a precision band-gap reference, comparator, and internally trimmed resistors that set specified trip threshold voltages. Designed to monitor the system supply voltage and an output during power-up, power-down, and brownout conditions, these devices provide excellent circuit reliability and low cost by eliminating external components and adjustments when monitoring nominal system voltage from 1.8V to 3.6V.

The MAX16072 has a push-pull active-low reset output, the MAX16073 has a push-pull active-high reset output, and the MAX16074 has an open-drain active-low reset output. The devices are designed to ignore fast transients on V_{CC}. The devices also include a manual reset input ($\overline{MR}$). When $\overline{MR}$ is low, reset is asserted. When $\overline{MR}$ is high and V_{CC} is above the detector threshold (V_{TH}), reset is not asserted.

Supply and Monitored Input (V_{CC})

The MAX16072/MAX16073/MAX16074 operate with a V_{CC} supply voltage from 1.2V to 2.75V. V_{CC} has a rising threshold of V_{TH} + V_{HYST} and a falling threshold of V_{TH}. When V_{CC} rises above V_{TH} + V_{HYST} and $\overline{MR}$ is high, $\overline{RESET}$ goes high (RESET goes low) after the reset timeout period (t_{RP}). See Figure 1.

When V_{CC} falls below V_{TH}, $\overline{RESET}$ goes low (RESET goes high) after a fixed delay (t_{RD}).

MAXIM

µP Supervisory Circuits in 4-Bump (1mm x 1mm) Chip-Scale Package

Manual Reset Input (MR)

Many µP-based products require manual-reset capability, allowing the operator, a test technician, or external logic circuit to initiate a reset. A logic-low on $\overline{MR}$ asserts reset. Reset remains asserted while $\overline{MR}$ is low, and for the reset active timeout period (t_{RP}) or delay (t_{ON}) after $\overline{MR}$ returns high. This input has an internal 50kΩ pullup resistor, so it can be left unconnected if it is not used. $\overline{MR}$ can be driven with TTL or CMOS logic levels, or with open-drain/collector outputs. For manual operation, connect a normally open momentary switch from $\overline{MR}$ to GND; external debouncing circuitry is not required. If $\overline{MR}$ is driven from long cables or if the device is used in a noisy environment, connect a 0.1µF capacitor from $\overline{MR}$ to ground to provide additional noise immunity.

Applications Information

Interfacing to µP with Bidirectional Reset Pins

Since $\overline{RESET}$ on the MAX16074 is open-drain, this device interfaces easily with µPs that have bidirectional reset pins. Connecting the µP supervisor's $\overline{RESET}$ output directly to the µP's $\overline{RESET}$ pin with a single pullup resistor allows either device to assert reset (Figure 2).

Negative-Going V_CC Transients

The MAX16072/MAX16073/MAX16074 family of devices is relatively immune to short-duration, negative-going V_{CC} transients (glitches). The *Typical Operating Characteristics* show the Maximum Transient Duration vs. Reset Threshold Overdrive graph, for which reset pulses are not generated. The graph shows the maximum pulse width that a negative-going V_{CC} transient may typically have when issuing a reset signal. As the amplitude of the transient increases, the maximum allowable pulse width decreases.
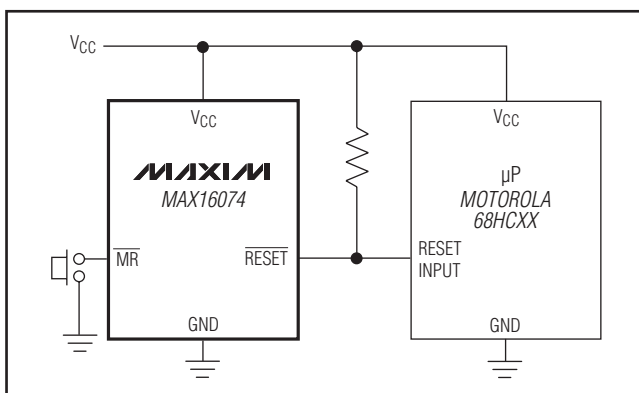

Table 1. Factory Trimmed Reset Thresholds

THRESHOLD SUFFIX	RESET TRIP THRESHOLD (V)
