❖ PIN ASSIGNMENT

The package of AX1116A is SOT-23-5L; the pin assignment is given by:

| Name | Description |
|------|---|
| VIN | The input pin of the regulator. Typically a large storage capacitor is connected from this pin to ground to insure that the input voltage does not sag below the minimum drop out voltage during the load transient response. This pin must always be higher than V_{OUT} by at least the amount of the dropout voltage and some margin in order for the device to regulate properly. |
| ADJ | A resistor divider from this pin to the VOUT pin and ground sets the output voltage. |
| EN | Enable pin. A low signal or left open on this pin shuts down the output. This pin must be tied High or to V_{IN} for normal operation. |
| VOUT | The output of the regulator. A minimum of 2.2 μ F with max ESR of 1 Ω capacitor must be connected from this pin to ground to insure stability. |
| GND | Ground pin. This pin must be connected to the lowest potential in the system and all other pins must be at higher potential with respect to this pin. |

Note1. Low duty cycle pulse testing with Kelvin connections is required in order to maintain accurate data.

Note2. Dropout voltage is defined as the minimum differential voltage between V_{IN} and V_{OUT} required to maintain regulation at V_{OUT} . It is measured when the output voltage drops 1% below its nominal value.

Note3. Ground current is the regulator quiescent current plus the pass transistor current. The total current from the supply is the sum of the load current plus the ground pin current.

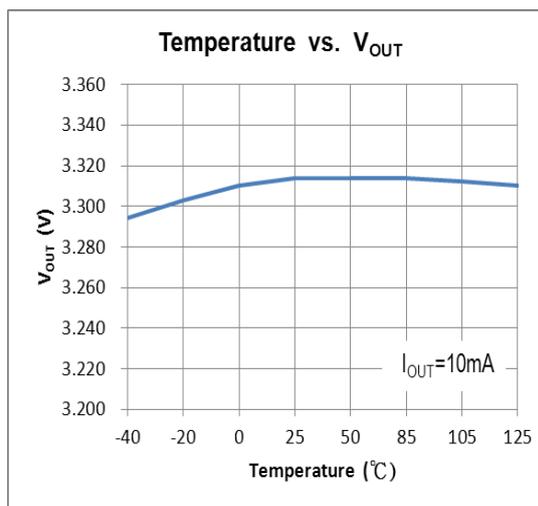

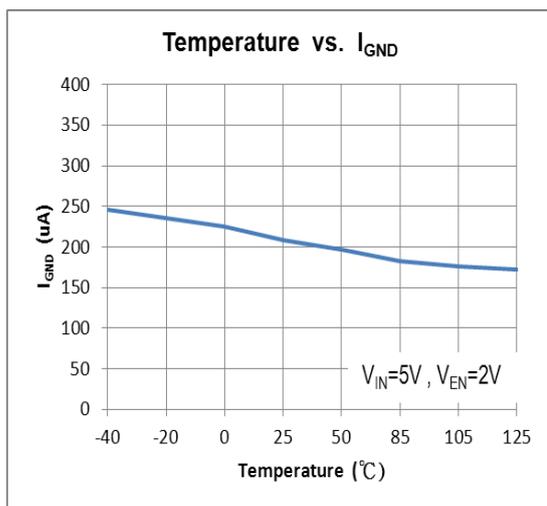

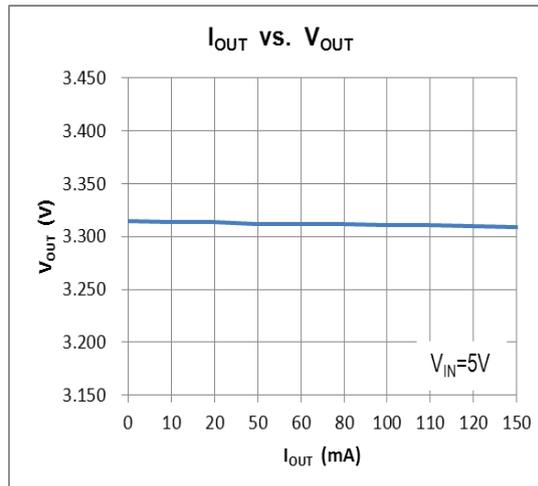

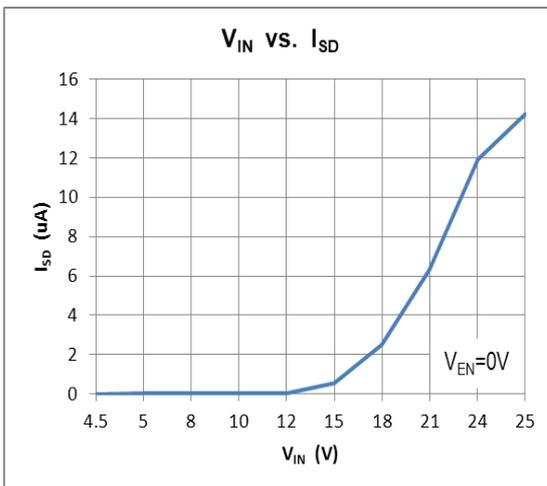

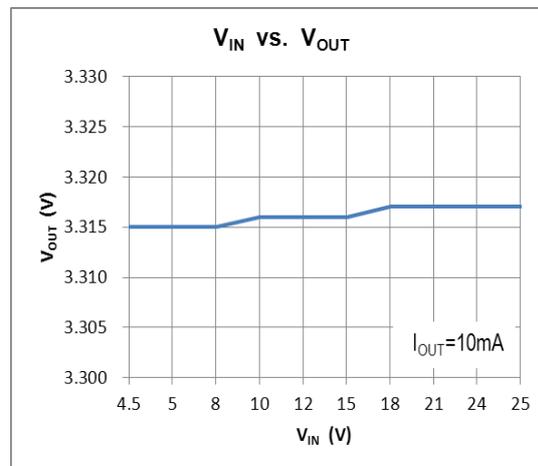

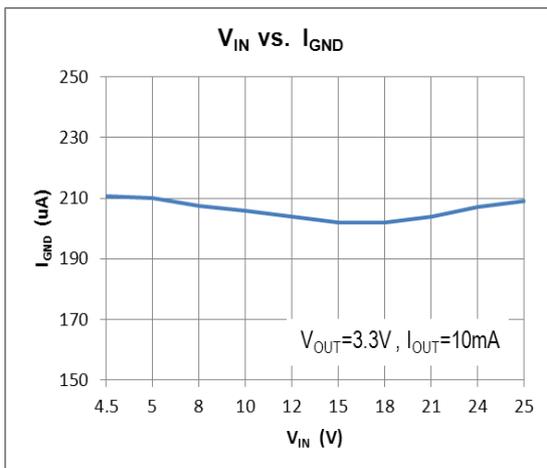

❖ APPLICATION CIRCUIT

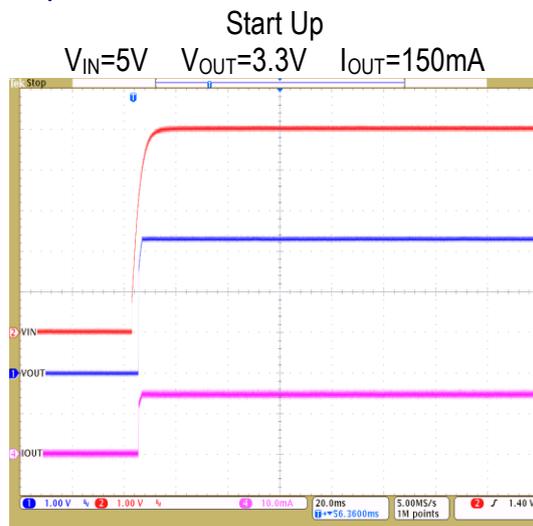

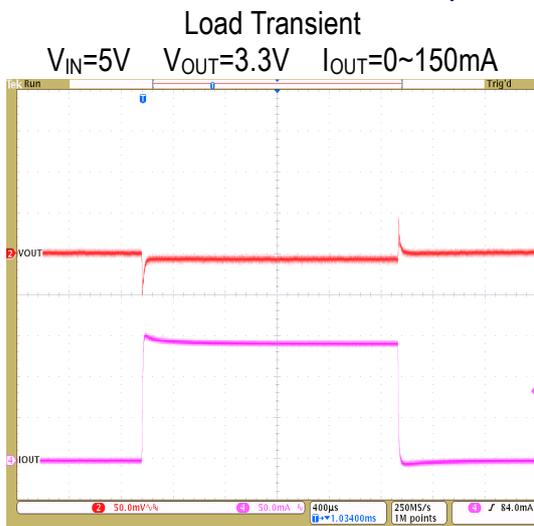

$$V_{OUT} = 1.25 * (1 + R1/R2)$$

R2 Suggest to be 200~300Ω
