General Description

The G543 is an integrated power switch for self-powered. The G543 has a typical $R_{DS(ON)}$ of 70mohm.

Several Protection features include current limiting with foldback, and thermal shutdown to prevent catastrophic switch failure caused by increasing power dissipation when continuous heavy loads or short circuit occurs. A built-in charge pump is used to drive the N-channel MOSFET that is free of parasitic body diode to eliminate any reversed current flow across the switch when it is powered off.

\overline{OC} is open-drain output report over-current or over-temperature event and has typical 9ms deglitch timeout period.

Typical Application Circuit

*: 1μF of input capacitor is enough in most application cases.
 If the PCB trace of power rail to IN is long, larger input capacitor is necessary.
