Low Power Mono Audio CODEC

FEATURES

System

- High performance and low power multi-bit delta-sigma audio ADC and DAC
- I^{2}S/PCM master or slave serial data port
- 256/384Fs, USB 12/24 MHz and other non standard audio system clocks
- I^{2}C interface

ADC

- 24-bit, 8 to 96 kHz sampling frequency
- 100 dB signal to noise ratio, -93 dB THD+N
- One pair of analog input with differential input option
- Low noise pre-amplifier
- Noise reduction filters
- Auto level control (ALC) and noise gate
- Support analog and digital microphone

DAC

- 24-bit, 8 to 96 kHz sampling frequency
- 110 dB signal to noise ratio, -80 dB THD+N
- One pair of analog output with headphone driver and differential output option
- Dynamic range compression
- Pop and click noise suppression

Low Power

- 1.8V to 3.3V operation
- 14 mW playback and record
- Low standby current

APPLICATIONS

- Automotive
- Phone
- Toy
- 2-way radio
- Dash cam
- IP Camera
- DVR, NVR
- Surveillance

3. TYPICAL APPLICATION CIRCUIT

GND(SYS)   0R   AGND
In the layout, chip is treated as a analog device

For the best performance,decoupling and filtering capacitors should be located as close to the device package as possible
✳ Additional paralle capacitors(typically 0.1 μF) can be used, larger value capacitors(typically 10 μF) would also help

4. CLOCK MODES AND SAMPLING FREQUENCIES

The device supports standard audio clocks (64F, 128Fs, 256Fs, 384Fs, 512Fs, etc), USB clocks (12/24 MHz), and some common non standard audio clocks (16 MHz, 25 MHz, 26 MHz, etc).

According to the serial audio data sampling frequency (Fs), the device can work in two speed modes: single speed mode or double speed mode. In single speed mode, Fs normally ranges from 8 kHz to 48 kHz, and in double speed mode, Fs normally range from 64 kHz to 96 kHz.

The device can work either in master clock mode or slave clock mode. In slave mode, LRCK and SCLK are supplied externally, and LRCK and SCLK must be synchronously derived from the system clock with specific rates. In master mode, LRCK and SCLK are derived internally from device master clock.

5. MICRO-CONTROLLER CONFIGURATION INTERFACE

The device supports standard I^{2}C micro-controller configuration interface. External micro-controller can completely configure the device through writing to internal configuration registers.

I^{2}C interface is a bi-directional serial bus that uses a serial data line (CDATA) and a serial clock line (CCLK) for data transfer. The timing diagram for data transfer of this interface is given in Figure 1a and Figure 1b. Data are transmitted synchronously to CCLK clock on the CDATA line on a byte-by-byte basis. Each bit in a byte is sampled during CCLK high with MSB bit being transmitted firstly. Each transferred byte is followed by an acknowledge bit from receiver to pull the CDATA low. The transfer rate of this interface can be up to 400 kbps.

A master controller initiates the transmission by sending a "start" signal, which is defined as a high-to-low transition at CDATA while CCLK is high. The first byte transferred is the slave address. It is a seven-bit chip address followed by a RW bit. The chip address must be 0011 00x, where x equals CE. The RW bit indicates the slave data transfer direction. Once an acknowledge bit is received, the data transfer starts to proceed on a byte-by-byte basis in the direction specified by the RW bit. The master can terminate the communication by generating a "stop" signal, which is defined as a low-to-high transition at CDATA while CCLK is high.

In I^{2}C interface mode, the registers can be written and read. The formats of "write" and "read" instructions are shown in Table 1 and Table 2. Please note that, to read data from a register, you must set R/W bit to 0 to access the register address and then set R/W to 1 to read data from the register.

	Chip Address	R/W		Register Address		Data to be written

6. DIGITAL AUDIO INTERFACE

The device provides many formats of serial audio data interface to the input of the DAC or output from the ADC through LRCK, SCLK and DSDIN or ASDOUT pins. These formats are I^{2}S, left justified, right justified and DSP/PCM. DAC input DSDIN is sampled by the device on the rising edge of SCLK. ADC data is out at ASDOUT on the falling edge of SCLK. The relationship of SDATA (DSIN/ASDOUT), SCLK and LRCK with these formats are shown through Figure 2a to Figure 2d.
