

# Complementary Power Darlington

## For Isolated Package Applications

Designed for general-purpose amplifiers and switching applications, where the mounting surface of the device is required to be electrically isolated from the heatsink or chassis.

- Isolated Overmold Package, TO-220 Type
- Electrically Similar to the Popular 2N6388, 2N6668, TIP102 and TIP107
- 100 V<sub>CEO(sus)</sub>
- 10 A Rated Collector Current
- No Isolating Washers Required
- Reduced System Cost
- High DC Current Gain — 1000 (Min) @ I<sub>C</sub> = 5.0 Adc
- High Isolation Voltage (up to 4500 VRMS)
- Case 221D is UL Recognized at 3500 VRMS: File #E69369

### MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Collector-Emitter Voltage	V <sub>CEO</sub>	100	Vdc
Collector-Base Voltage	V <sub>CB</sub>	100	Vdc
Emitter-Base Voltage	V <sub>EB</sub>	5.0	Vdc
RMS Isolation Voltage (1) (for 1 sec, R.H. < 30%, T <sub>A</sub> = 25°C)	V <sub>ISOL</sub>	4500 3500 1500	V
Collector Current — Continuous — Peak(2)	I <sub>C</sub>	10 15	Adc
Base Current	I <sub>B</sub>	1.0	Adc
Total Power Dissipation* @ T <sub>C</sub> = 25°C Derate above 25°C	P <sub>D</sub>	40 0.31	Watts W/°C
Total Power Dissipation @ T <sub>A</sub> = 25°C Derate above 25°C	P <sub>D</sub>	2.0 0.016	Watts W/°C
Operating and Storage Junction Temperature Range	T <sub>J</sub> , T <sub>stg</sub>	-65 to +150	°C

### THERMAL CHARACTERISTICS

Characteristic	Symbol	Max	Unit
Thermal Resistance, Junction to Case*	R <sub>θJC</sub>	3.2	°C/W
Thermal Resistance, Junction to Ambient	R <sub>θJA</sub>	62.5	°C/W
Lead Temperature for Soldering Purpose	T <sub>L</sub>	260	°C

(1) Proper strike and creepage distance must be provided.

(2) Pulse Test: Pulse Width = 5.0 ms, Duty Cycle ≤ 10%.

\* Measurement made with thermocouple contacting the bottom insulated mounting surface of the package (in a location beneath the die), the device mounted on a heatsink, thermal grease applied and a mounting torque of 6 to 8 in•lbs.

Preferred devices are Motorola recommended choices for future use and best overall value.

Figure 4. Maximum Forward Bias Safe Operating Area

Figure 5. Thermal Response

Figure 6. Maximum Power Derating

There are two limitations on the power handling ability of a transistor: average junction temperature and second breakdown. Safe operating area curves indicate  $I_C - V_{CE}$  limits of the transistor that must be observed for reliable operation; i.e., the transistor must not be subjected to greater dissipation than the curves indicate.

The data of Figure 4 is based on  $T_{J(pk)} = 150\text{°C}$ ;  $T_C$  is variable depending on conditions. Secondary breakdown pulse limits are valid for duty cycles to 10% provided  $T_{J(pk)} < 150\text{°C}$ .  $T_{J(pk)}$  may be calculated from the data in Figure 5. At high case temperatures, thermal limitations will reduce the power that can be handled to values less than the limitations imposed by secondary breakdown.

TEST CONDITIONS FOR ISOLATION TESTS\*

MOUNTING INFORMATION

Figure 17. Typical Mounting Techniques\*

Laboratory tests on a limited number of samples indicate, when using the screw and compression washer mounting technique, a screw torque of 6 to 8 in · lbs is sufficient to provide maximum power dissipation capability. The compression washer helps to maintain a constant pressure on the package over time and during large temperature excursions.

Destructive laboratory tests show that using a hex head 4-40 screw, without washers, and applying a torque in excess of 20 in · lbs will cause the plastic to crack around the mounting hole, resulting in a loss of isolation capability.

Additional tests on slotted 4-40 screws indicate that the screw slot fails between 15 to 20 in · lbs without adversely affecting the package. However, in order to positively ensure the package integrity of the fully isolated device, Motorola does not recommend exceeding 10 in · lbs of mounting torque under any mounting conditions.

\*\* For more information about mounting power semiconductors see Application Note AN1040.
