

5-V Low-Drop Voltage Regulator

TLE 4261-2

Features

- High accuracy $5\text{ V} \pm 2\%$
- Very low-drop voltage
- Very low quiescent current
- Low starting-current consumption
- Proof against reverse polarity
- Input voltage up to 42 V
- Overvoltage protection up to 65 V ($\leq 400\text{ ms}$)
- Short-circuit-proof
- External setting of reset delay
- Integrated watchdog circuit
- Wide temperature range
- Overtemperature protection
- Suitable for automotive use
- EMC proofed (100 V/m)

Functional Description

TLE 4261-2 is a high accuracy 5-V low-drop voltage regulator in a P-TO220-7 or in a P-DSO package. The maximum input voltage is 42 V (65 V/ $\leq 400\text{ ms}$). The device can produce an output current of more than 500 mA. It is short-circuit-proof and incorporates temperature protection that disables the circuit at impermissibly high temperatures.

Application Description

The IC regulates an input voltage V_I in the range $6\text{ V} < V_I < 40\text{ V}$ to $V_{\text{Qrated}} = 5.0\text{ V}$. A reset signal is generated for an output voltage V_O of $< 4.75\text{ V}$. The reset delay can be set with an external capacitor. A connected microprocessor is monitored by the integrated watchdog circuit; if pulses are missing, the reset output is set low. The pulse repetition rate can be set within wide limits with the capacitor for reset delay. If this input is connected to a voltage of $> 6\text{ V}$, the watchdog function is deactivated. The device also features an inhibit input, which is activated by a voltage of $> 6\text{ V}$ and then works on this input through internal hysteresis up to approx. 3 V . A voltage of $< 2\text{ V}$ on the inhibit input turns off the regulator, current drain then dropping to max. $50\text{ }\mu\text{A}$.

Design Notes for External Components

The input capacitor C_1 causes a low-resistance powerline and limits the rise times of the input voltage. The IC is protected against rise times up to $100\text{ V}/\mu\text{s}$. It is possible to damp the tuned circuit consisting of supply inductance and input capacitance with a resistor of approx. $1\text{ }\Omega$ in series to C_1 .

The output capacitor maintains the stability of the regulating loop. Stability is guaranteed with a rating of $22\text{ }\mu\text{F}$ min. at an ESR of $3\text{ }\Omega$ max. in the operating temperature range.

Circuit Description

The control amplifier compares a reference voltage, which is kept highly accurate by resistance adjustment, to a voltage that is proportional to the output voltage and controls the base of the series PNP transistor via a buffer. Saturation control as a function of the load current prevents any over-saturation of the power element. If the output voltage drops below 95.5% of its typical value for more than $2\text{ }\mu\text{s}$, a reset signal is triggered on pin 3 and an external capacitor discharged on pin 5. The reset signal is not cancelled until the voltage on the capacitor has exceeded the upper switching threshold V_{DT} . A positive-edge-triggered watchdog circuit monitors the connected microprocessor and will likewise trigger a reset if pulses are missing. The IC can be disabled by a low level on the inhibit input and the current consumption drops to $< 50\text{ }\mu\text{A}$.

The IC also incorporates a number of circuits for protection against:

- Overload
- Overvoltage
- Overtemperature
- Reverse polarity

Pin Configuration

Pin Definitions and Functions

Pin No.	Symbol	Function
1	V_I	Input voltage ; block a capacitor directly to ground on the IC. The capacitor rating will depend on the vehicle electric system. Oscillation of the output voltage can be damped by a resistor of approx. 1Ω in series with the input capacitor.
2	INH	Inhibit ; switches off the IC when low.
3	QRES	Reset output ; open collector output controlled by the reset delay.
4	GND	Ground
5	DRES	Reset delay ; wired to ground using a capacitor.
6	Watch	Watchdog ; monitors the microprocessor when active.
7	V_Q	5-V output ; block to ground using a capacitor of $\geq 22\text{-}\mu\text{F}$. ESR is $\leq 3 \Omega$ in the operating temperature range.

TLE 4261-2 G

AEP01182

Pin No.	Symbol	Function
18	V _I	Input voltage ; block a capacitor directly to ground on the IC. The capacitor rating will depend on the vehicle electric system. Oscillation of the output voltage can be damped by a resistor of approx. 1 Ω in series with the input capacitor.
20	INH	Inhibit ; switches off the IC when low.
3	QRES	Reset output ; open collector output controlled by the reset delay.
4 -7, 14 - 17	GND	Ground
9	DRES	Reset delay ; wired to ground using a capacitor.
11	Watch	Watchdog ; monitors the microprocessor when active.
12	V _Q	5-V output ; block to ground using a capacitor of ≥ 22-μF. ESR is ≤ 3 Ω in the operating temperature range.
1, 2, 8, 10, 13, 19	N.C.	Not connected
