

6A High-Speed MOSFET Drivers

Features

- Latch-Up Protected: will withstand >1.5A Reverse Output Current
- Logic Input will withstand Negative Swing Up to 5V
- ESD Protected: 4 kV
- Matched Rise and Fall Times:
- 25 nsec (2500 pF load)
- High Peak Output Current: 6A Peak
- Wide Input Supply Voltage Operating Range:
- 4.5V to 18V
- High Capacitive Load Drive Capability: 10,000 pF
- Short Delay Time: 55 nsec (typ.)
- Logic High Input, Any Voltage: 2.4V to V_{DD}
- Low Supply Current With Logic '1' Input:
 450 µA (tvp.)
- Low Output Impedance: 2.5Ω
- Output Voltage Swing to Within 25 mV of Ground or $\rm V_{DD}$

Applications

- · Switch-Mode Power Supplies
- Motor Controls
- Pulse Transformer Driver
- · Class D Switching Amplifiers

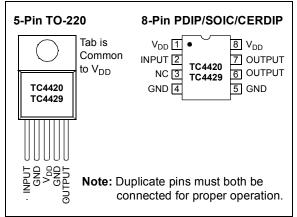

General Description

The TC4420/TC4429 are 6A (peak), single output MOSFET drivers. The TC4429 is an inverting driver (pin-compatible with the TC429), while the TC4420 is a non-inverting driver. These drivers are fabricated in CMOS for lower power, more efficient operation versus bipolar drivers.

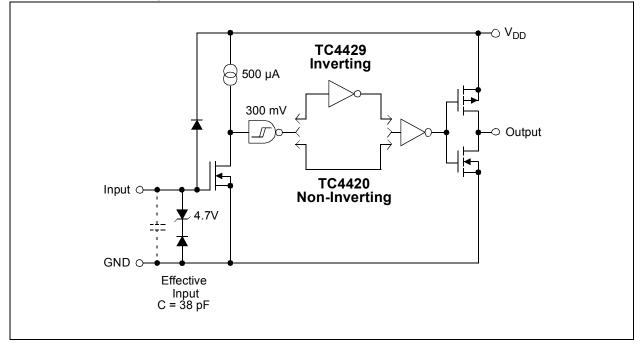

Both devices have TTL-compatible inputs, which can be driven as high as V_{DD} + 0.3V or as low as -5V without upset or damage to the device. This eliminates the need for external level-shifting circuitry and its associated cost and size. The output swing is rail-to-rail, ensuring better drive voltage margin, especially during power-up/ power-down sequencing. Propagational delay time is only 55 nsec (typ.) and the output rise and fall times are only 25 nsec (typ.) into 2500 pF across the usable power supply range.

Unlike other drivers, the TC4420/TC4429 are virtually latch-up proof. They replace three or more discrete components, saving PCB area, parts and improving overall system reliability.

Package Types:

Functional Block Diagram

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings†

Supply Voltage	+20V
Input Voltage – 5V	to V _{DD} + 0.3V
Input Current (V _{IN} > V _{DD})	50 mA
Power Dissipation ($T_A \le 70^{\circ}C$)	
PDIP	730 mW
SOIC	470 mW
CERDIP	800 mW
5-Pin TO-220	1.6W
Package Power Dissipation ($T_A \le 25^{\circ}C$)	
5-Pin TO-220 (With Heatsink)	12.5W
Derating Factors (To Ambient)	
PDIP	8 mW/°C
SOIC	4 mW/°C
CERDIP	6.4 mW/°C
5-Pin TO-220	12 mW/°C
Thermal Impedances (To Case)	
5-Pin TO-220 R _{θJ-C}	10°C/W

† Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions above those indicated in the operation sections of the specifications is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

DC CHARACTERISTICS

Electrical Specifications: Unless otherwise noted, $T_A = +25^{\circ}C$ with 4.5V $\leq V_{DD} \leq 18V$.

2.0 TYPICAL PERFORMANCE CURVES

Note: The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore outside the warranted range.

Note: Unless otherwise indicated, $T_A = +25^{\circ}C$ with $4.5V \le V_{DD} \le 18V$.

3.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in Table 3-1.

TABLE 3-1: PIN FUNCTION TABLE

Pin No. (8-Pin PDIP, SOIC, CERDIP)	Pin No. (5-Pin TO-220)	Symbol	Description
1	_	V _{DD}	Supply input, 4.5V to 18V
2	1	INPUT	Control input, TTL/CMOS-compatible input
3	—	NC	No Connection
4	2	GND	Ground
5	4	GND	Ground
6	5	OUTPUT	CMOS push-pull output
7	—	OUTPUT	CMOS push-pull output
8	3	V _{DD}	Supply input, 4.5V to 18V

3.1 Supply Input (V_{DD})

The V_{DD} input is the bias supply for the MOSFET driver and is rated for 4.5V to 18V with respect to the ground pins. The V_{DD} input should be bypassed to ground with a local ceramic capacitor. The value of the capacitor should be chosen based on the capacitive load that is being driven. A minimum value of 1.0 μ F is suggested.

3.2 Control Input

The MOSFET driver input is a high-impedance, TTL/CMOS-compatible input. The input circuitry of the TC4420/TC4429 MOSFET driver also has a "speedup" capacitor. This helps to decrease the propagation delay times of the driver. Because of this, input signals with slow rising or falling edges should not be used as this can result in double-pulsing of the MOSFET driver output.

3.3 CMOS Push-Pull Output

The MOSFET driver output is a low-impedance, CMOS, push-pull style output, capable of driving a capacitive load with 6.0A peak currents. The MOSFET driver output is capable of withstanding 1.5A peak reverse currents of either polarity.

3.4 Ground

The ground pins are the return path for the bias current and for the high peak currents that discharge the load capacitor. The ground pins should be tied into a ground plane or have very short traces to the bias supply source return.

Sales and Support

Data Sheets

Products supported by a preliminary Data Sheet may have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

- 1. Your local Microchip sales office
- 2. The Microchip Corporate Literature Center U.S. FAX: (480) 792-7277
- 3. The Microchip Worldwide Site (www.microchip.com)

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

Customer Notification System

Register on our web site (www.microchip.com/cn) to receive the most current information on our products.

NOTES:

Note the following details of the code protection feature on Microchip devices:

- · Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is intended through suggestion only and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. No representation or warranty is given and no liability is assumed by Microchip Technology Incorporated with respect to the accuracy or use of such information, or infringement of patents or other intellectual property rights arising from such use or otherwise. Use of Microchip's products as critical components in life support systems is not authorized except with express written approval by Microchip. No licenses are conveyed, implicitly or otherwise, under any intellectual property rights.
