

# Smart High-Side Power Switch

## One Channel: 38mΩ

## Status Feedback

### Product Summary

On-state Resistance	$R_{ON}$	38mΩ
Operating Voltage	$V_{bb(on)}$	4.75...41V
Nominal load current	$I_{L(NOM)}$	9.8A
Current limitation	$I_{L(SCr)}$	40A

### Package

### General Description

- N channel vertical power MOSFET with charge pump, ground referenced CMOS compatible input and diagnostic feedback, monolithically integrated in Smart SIPMOS<sup>®</sup> technology.
- Providing embedded protective functions

### Applications

- μC compatible high-side power switch with diagnostic feedback for 5V, 12V and 24V grounded loads
- All types of resistive, inductive and capacitive loads
- Most suitable for loads with high inrush currents, so as lamps
- Replaces electromechanical relays, fuses and discrete circuits

### Basic Functions

- Very low standby current
- CMOS compatible input
- Fast demagnetization of inductive loads
- Stable behaviour at undervoltage
- Wide operating voltage range
- Logic ground independent from load ground

### Protection Functions

- Short circuit protection
- Overload protection
- Current limitation
- Thermal shutdown
- Overvoltage protection (including load dump) with external resistor
- Reverse battery protection with external resistor
- Loss of ground and loss of  $V_{bb}$  protection
- Electrostatic discharge protection (ESD)

### Diagnostic Function

- Diagnostic feedback with open drain output
- Open load detection in ON-state
- Feedback of thermal shutdown in ON-state

<sup>10)</sup> Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

<sup>11)</sup> Device on 50mm\*50mm\*1.5mm epoxy PCB FR4 with 6cm<sup>2</sup> (one layer, 70 $\mu\text{m}$  thick) copper area for  $V_{bb}$  connection. PCB is vertical without blown air.

<sup>12)</sup> Requires 150  $\Omega$  resistor in GND connection. The reverse load current through the intrinsic drain-source diode has to be limited by the connected load. Note that the power dissipation is higher compared to normal operating conditions due to the voltage drop across the intrinsic drain-source diode. The temperature protection is not active during reverse current operation! Input and Status currents have to be limited (see max. ratings page 3 and circuit page 7).

<sup>13)</sup> not subject to production test, specified by design

<sup>14)</sup> If a ground resistor  $R_{\text{GND}}$  is used, add the voltage drop across this resistor.

Status signal after the time delay shown in the diagrams (see fig 5. page 11)

**Terms**

**Input circuit (ESD protection)**

The use of ESD zener diodes as voltage clamp at DC conditions is not recommended

**Status output**

ESD-Zener diode: 6.1 V typ., max 5.0 mA;  $R_{ST(ON)} < 375 \Omega$  at 1.6 mA. The use of ESD zener diodes as voltage clamp at DC conditions is not recommended.

**Inductive and overvoltage output clamp**

$V_{ON}$  clamped to 47 V typ.

**Overvolt. and reverse batt. protection**

$V_{Z1} = 6.1 \text{ V typ.}$ ,  $V_{Z2} = 47 \text{ V typ.}$ ,  $R_{GND} = 150 \Omega$ ,  $R_{ST} = 15 \text{ k}\Omega$ ,  $R_I = 3.5 \text{ k}\Omega \text{ typ.}$

In case of reverse battery the load current has to be limited by the load. Temperature protection is not active

**Open-load detection in on-state**

Open load, if  $V_{ON} < R_{ON} \cdot I_{L(OL)}$ ; IN high

**GND disconnect**

Any kind of load. In case of Input=high is  $V_{OUT} \approx V_{IN} - V_{IN(T+)}$ . Due to  $V_{GND} > 0$ , no  $V_{ST} = \text{low signal}$  available.

**GND disconnect with GND pull up**

Any kind of load. If  $V_{GND} > V_{IN} - V_{IN(T+)}$  device stays off  
 Due to  $V_{GND} > 0$ , no  $V_{ST} = \text{low}$  signal available.

**Vbb disconnect with energized inductive load**

For inductive load currents up to the limits defined by  $Z_L$  (max. ratings and diagram on page 8) each switch is protected against loss of  $V_{bb}$ .

Consider at your PCB layout that in the case of  $V_{bb}$  disconnection with energized inductive load all the load current flows through the GND connection.

**Inductive Load switch-off energy dissipation**

Energy stored in load inductance:

$$E_L = \frac{1}{2} \cdot L \cdot I_L^2$$

While demagnetizing load inductance, the energy dissipated in PROFET is

$$E_{AS} = E_{bb} + E_L - E_R = \int V_{ON(CL)} \cdot i_L(t) dt,$$

with an approximate solution for  $R_L > 0 \Omega$ :

$$E_{AS} = \frac{I_L \cdot L}{2 \cdot R_L} \cdot (V_{bb} + |V_{OUT(CL)}|) \cdot \ln \left( 1 + \frac{I_L \cdot R_L}{|V_{OUT(CL)}|} \right)$$

**Maximum allowable load inductance for a single switch off**

$L = f(I_L)$ ;  $T_{j,start} = 150^\circ\text{C}$ ,  $T_C = 150^\circ\text{C}$  const.,  
 $V_{bb} = 12\text{V}$ ,  $R_L = 0 \Omega$

$Z_L$  [mH]

$I_L$  [A]

**Typ. on-state resistance**

$R_{ON} = f(V_{bb}, T_j); I_L = 2\text{ A}, I_N = \text{high}$

**Typ. standby current**

$I_{bb(off)} = f(T_j); V_{bb} = 9 \dots 34\text{ V}, I_{N1,2} = \text{low}$
