

MMC 4017, MMC 4022

COUNTER/DIVIDERS: 4017 DECADA COUNTER WITH 10 DECODED OUTPUTS 4022 OCTAL COUNTER WITH 8 DECODED OUTPUTS

GENERAL DESCRIPTION

The MMC 4017 and MMC 4022 are 5-stage and 4 stage Johnson counters having 10 and 8 decoded outputs respectively.

The MMC 4017 and MMC 4022 are monolithic integrated circuits, fabricated in standard Al-gate CMOS technology. Are available in 16-lead dual in-line-plastic package.

Inputs include a CLOCK, a RESET and a CLOCK inhibit signal. Schmitt trigger in the CLOCK input circuit provides pulse shaping that allows unlimited clock input pulse rise and fall times. These counters are advanced one count at the positive clock signal transition if the CLOCK INHIBIT signal is low. Counter advancement via the clock line is inhibited when the CLOCK INHIBIT signal is high. A high RESET signal clears the counter to its zero count. Use of the Johnson decade-counter configuration permits high-speed operation, 2-input decimal-decode gating and spike-free decoded outputs. Anti-lock gating is provided, thus assuring proper counting sequence. The

decoded outputs are normally low and go high only at their respective decoded time slot. Each decoded Output remains high for one full clock cycle. A CARRY-OUT signal completes one cycle every 10 clock input cycles in the MMC 4017 or every 8 clock input cycles in the MMC 4022 and is used to ripple-clock the succeeding device in a multi-device counting chain.

FEATURES

- Fully static operation
- Medium speed operation -12 MHz (typ) at $V_{DD} = 10V$

APPLICATIONS

- Decade counter/decimal decode display
- Binary counter/decoder
- Frequency division
- Counter control/timers
- Divide — by — N counting.

ABSOLUTE MAXIMUM RATINGS

V_{DD}^*	Supply voltage: G and H types E and F types	-0.5 to -0.5 to	20 18	V V
V_i	Input voltage	-0.5 to	$V_{DD} \pm 0.5$	V
I_i	DC input current (any one input)		± 10	mA
P_{tot}	Total power dissipation (per package) Dissipation per output transistor		200	mW
T_A	Operating temperature: G and H types E and F types		100	mW
T_{sto}	Storage temperature	-55 to -40 to -65 to	125 85 150	°C °C °C

* All voltage values are referred to V_{SS} pin voltage

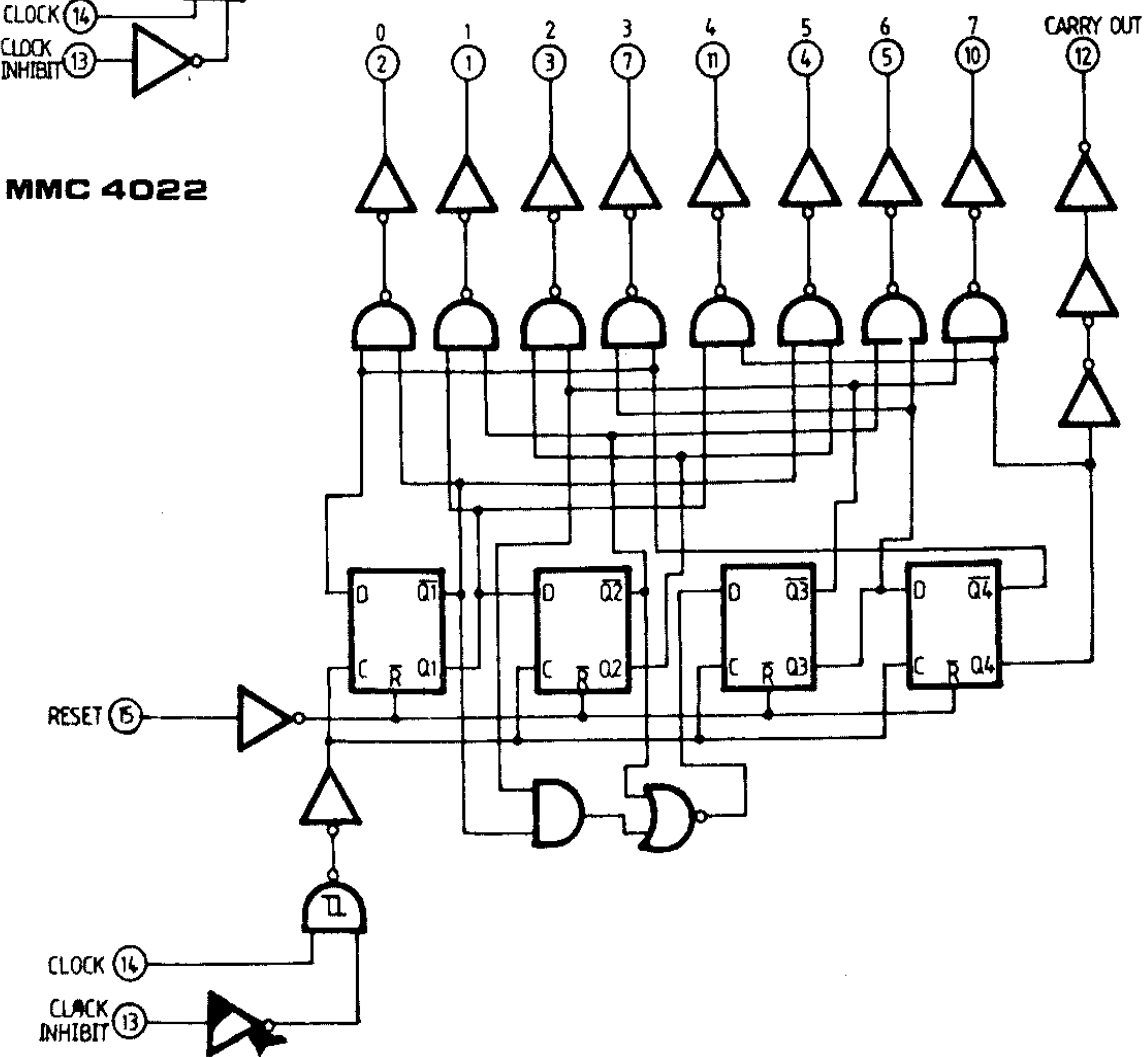

RECOMMENDED OPERATING CONDITIONS

V_{DD}^*	Supply voltage: G and H types E and F types	3 to 3 to	18 15	V V
V_i	Input voltage	0 to	V_{DD}	V
T_A	Operating temperature: G and H types E and F types	-55 to -40 to	125 85	°C °C

t_{rem} Minimum reset removal time	5		200	400	ns
	10		140	280	
	15		75	150	

TYPICAL APPLICATIONS

Divide by N counter ($N \leq 10$) with N decoded outputs

When the N^{th} decoded output is reached (N^{th} clock pulse) the R—S flip-flop (constructed from two NOR gates of MMC 4001) generates a reset pulse which clears the MMC 4017 to its zero count. At this time, if the N^{th} decoded output is greater than or equal to 6, the C_{OUT} line goes high to clock the next MMC 4017 counter section. The "0" decoded output also goes high at this time. Coincidence of the clock low and decoded "0" output high resets the R—S flip-flop to enable the MMC 4017. If the N^{th} decoded output is less than 6, the C_{OUT} line will not go high and, therefore, cannot be used. In this case "0" decoded output may be used to perform the clocking function for the next counter.
