

3.3V 5V ±12V Housekeeping IC

- Over voltage and under voltage protection for 3.3V 5V and ±12V without external components
- Under voltage blanking function
- Power good input/output
- Externally adjustable PG delay
- Fault output
- Remote input
- Externally adjustable remote delay
- Precision voltage reference
- 2kV ESD protection (HBM)

Description

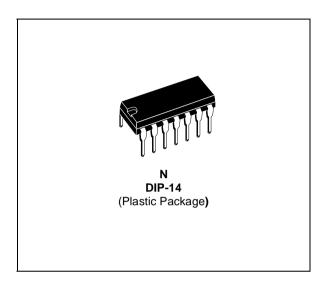

The TSM114 integrated circuit incorporates all of the sensing circuitry required to regulate and protect a multiple-output power supply (3.3V, 5V, and \pm 12V) from both over-voltage and under-voltage.

The TSM114 also includes all of the necessary functions for housekeeping features, which allow for safe operation under all conditions, as well as very high system integration.

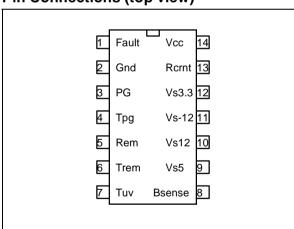

A precise voltage reference is also integrated in the TSM114

Applications

■ PC SMPS multiple Power Line Housekeeping IC (3.3V 5V ±12V)

Pin Connections (top view)

TSM114 Pin Descriptions

1 Pin Descriptions

Table 1: This table gives the pin description for DIP14 package

Name	Pin #	Туре	Function
Fault	1	Open collector	Fault output. Output of the over voltage and under voltage comparators
Gnd	2	Power supply	Signal ground and silicon substrate
PG	3	Open collector	Output of the Tpg comparator. This pin goes low upon an under voltage condition. Except for the delay set by the Tpg capacitor this pin always reflects the actual state of the under voltage sensing comparators output.
Трд	4	Timing capacitor	A capacitor from this pin to Gnd provides a delay between outputs rail voltage within regulation and PG output going high. Capacitor discharges whenever Bsense low or Rem high or UVP is detected.
Rem	5	Control Input pin	Pulling this pin high will send the Fault pin high latching off the power supply, reset the internal latch, discharge the start-up timing capacitors, Tuv and Tpg capacitors, allowing normal start up of the system. Pulling this pin low will send the Fault pin low, initiating a normal start up function.
Trem	6	Timing capacitor	A capacitor from this pin to Gnd will delay the Fault signal when the Rem pin is used to shut down the power supply. The PG will signal a power failure warming immediately, but the Fault pin shut down of the power will be delayed.
Tuv	7	Timing capacitor A capacitor from this pin to Gnd will provide the under voltage function. This capacitor is charging when the Bsense and Rem the right state. As the voltage at this pin is larger than the Vref The under voltage function resume.	
Bsense	8	Control input pin	Non inverting input to the Bsense voltage sensing comparator. Pulling this pin lower than 2.5V will cause PG goes low and Tuv goes low.
Vs5	9	Analog input	Over voltage and under voltage detection for +5V rail
Vs12	10	Analog input	Over voltage and under voltage detection for +12V rail
Vs-12	11	Analog input	Over voltage and under voltage detection for -12V rail.
Vs3.3	12	Analog input	Over voltage and under voltage detection for 3.3V rail. This function is disabled by connecting to Vcc
Rcrnt	13	Analog input	A resister from this pin to Gnd will provide the internal constant current.
Vcc	14	Power supply	Supply input voltage

2 Absolute Maximum Ratings

Table 2: Key parameters and their absolute maximum ratings

Symbol	DC Supply Voltage	Value	Unit
Vcc	DC Supply Voltage ¹	-0.3 to 25	V
Vpmax	Terminal voltage V12, V5, V3.3	-0.3 to 25	V
Vnmax	Terminal voltage V-12	-16 to Vref	V
VDBTT	VTuv, VTpg, VTrem input voltage	-0.3 to 3.3V	V
VTER	Other terminals	-0.3 to Vcc	V
PT	Power dissipation	1	W
Toper	Operational temperature	0 to 95	°C
Tstg	Storage temperature	-55 to 150	°C
Tj	Junction temperature	150	°C
ESD	Electrostatic Discharge	2K	V

¹⁾ All voltage values, except differential voltage are with respect to network ground terminal.

Table 3: Operating Conditions

Symbol	Parameter	Value	Unit
Vcc	DC Supply Conditions	4.2 to 24	V

3 Electrical Characteristics

TSM114 Housekeeping IC

4 Housekeeping IC

TSM114 is a one chip solution for all PC SMPS: it integrates on one chip the Housekeeping Circuitry (Over Voltage and Under Voltage protections, with adequate sequencing).

Multiple Power Line Protection

The TSM114 Housekeeping Circuit is dedicated to 3.3V, 5V and ±12V power lines protection. It integrates a Precision Voltage Reference, a multiple Over Voltage Protection Circuit and a multiple Under Voltage Protection Circuit as well as all the necessary logic and transient timing management circuits for optimal and secure communication with the motherboard, during start up, switch off and stabilized conditions.

Over Voltage Protection

The Over Voltage Protection Circuit is made of comparators with internal voltage thresholds which do not require any external components for proper operation. The outputs of these comparators are ORed.

Under Voltage Protection

The Under Voltage Protection Circuit is made of comparators with internal voltage thresholds which do not require any external components for proper operation. The outputs of these comparators are ORed, and blanked by an internal delay circuitry (Power Up Blanking - Tuv) which can be adjusted with an external capacitor (Cuv). This allows that during power up, the under voltage protection circuit is inhibited.

Fault

The Over Voltage and Under Voltage Circuits outputs are ORed before activating a latch. When activated, this latch commands the full switch OFF of the main power lines (3.3V, 5V, 12V) by an external link between the housekeeping and the primary PWM circuits via the main optocoupler or any other device.

Power Good

The Under Voltage Circuits are Ored to switch the Power Good output active (PG) to warn the motherboard that the voltage of at least one of the three power lines is out of range. The PG activation bears an internal Tpg delay circuitry which can be adjusted with an external capacitor (Cpg).

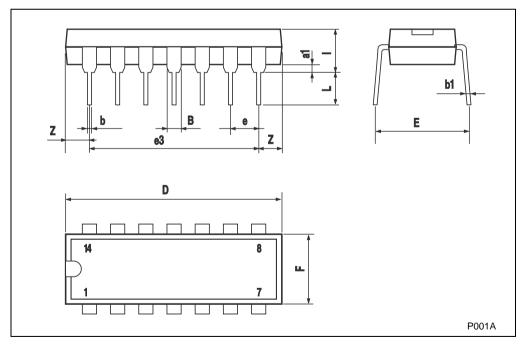

Remote Control

Thanks to this information link to the motherboard. a resetting signal to the latch is achievable with the Remote pin (REM). When the Remote pin is external Fault link active. the between Housekeeping circuit and the PWM generator is active (high = PWM OFF) and the PG pin is active (high). Note that to reset effectively the latch, a minimum width Remote pulse should be applied thanks to an internal delay circuitry (Trem) which can be adjusted with an external capacitor (Crem).
