# Low-Voltage 1:22 Differential PECL/HSTL Clock Driver

The MC100EP223 is a low skew 1-to-22 differential driver, designed with clock distribution in mind. It accepts two clock sources into an input multiplexer. The selected signal is fanned out to 22 identical differential outputs.

- 200ps Part-to-Part Skew
- 50ps Output-to-Output Skew
- Differential Design
- Open Emitter HSTL Compatible Outputs
- 3.3V  $V_{CC}$
- Both PECL and HSTL Inputs
- 75k $\Omega$  Input Pulldown Resistors
- Thermally Enhanced 64 lead Exposed Pad LQFP

The EP223 is specifically designed, modeled and produced with low skew as the key goal. Optimal design and layout serve to minimize gate-to-gate skew within a device, and empirical modeling is used to determine process control limits that ensure consistent  $t_{pd}$  distributions from lot to lot. The net result is a dependable, guaranteed low skew device.

The EP223 HSTL outputs are not realized in the conventional manner. To minimize part-to-part and output-to-output skew, the HSTL compatible output levels are generated with an open emitter architecture. The outputs are pulled down with 50 $\Omega$  to ground, rather than the typical 50 $\Omega$  to  $V_{DDQ}$  pullup of a "standard" HSTL output. Because the HSTL outputs are pulled to ground, the EP223 does not utilize the  $V_{DDQ}$  supply of the HSTL standard. The output levels are derived from  $V_{CC}$ .

In the case of an asynchronous control, there is a chance of generating a 'runt' clock pulse when the device is enabled/disabled. To avoid this, the output enable (OE) is synchronous so that the outputs will only be enabled/disabled when they are already in the LOW state.

To ensure that the tight skew specification is met it is necessary that both sides of the differential output are terminated into 50 $\Omega$ , even if only one side is being used. In most applications, all 22 differential pairs will be used and therefore terminated. In the case where fewer than 22 pairs are used, it is necessary to terminate at least the output pairs on the same package side as the pair(s) being used on that side, in order to maintain minimum skew. Failure to do this will result in small degradations of propagation delay (on the order of 10-20ps) of the output(s) being used which, while not being catastrophic to most designs, will mean a loss of skew margin.

## APPLICATIONS INFORMATION

**Using the thermally enhanced package of the MC100EP223**

The MC100EP223 uses a thermally enhanced 64 lead LQFP package. This package provides the low thermal impedance that supports the power consumption of the MC100EP223 high-speed bipolar integrated circuit and eases the power management task for the system design. An exposed pad at the bottom of the package establishes thermal conductivity from the package to the printed circuit board. In order to take advantage of the enhanced thermal capabilities of this package, it is recommended to solder the exposed pad of the package to the printed circuit board. The attachment process for exposed pad package is the same as for any standard surface mount package. Vias are recommended from the pad on the board down to an appropriate plane in the board that is capable of distributing the heat. In order to supply enough solder paste to fill those vias and not starve the solder joints, it may be required to stencil print solder paste onto the printed circuit pad. This pad should match the dimensions of the exposed pad. The dimensions of the exposed pad are shown on the package outline in this specification. For thermal system analysis and junction temperature calculation the thermal resistance parameters of the package is provided:

**Thermal Resistance**

Convection LFPM	R <sub>THJA</sub> <sup>a</sup> °C/W	R <sub>THJA</sub> <sup>b</sup> °C/W	R <sub>THJC</sub> <sup>c</sup> °C/W	R <sub>THJB</sub> <sup>d</sup> °C/W
Natural	57.1	24.9	15.8	9.7
100	50.0	21.3		
200	46.9	20.0		
400	43.4	18.7		
800	38.6	16.9		

- Junction to ambient, single layer test board, per JESD51-6
- Junction to ambient, four conductor layer test board (2S2P), per JES51-6
- Junction to case, per MIL-SPEC 883E, method 1012.1
- Junction to board, four conductor layer test board (2S2P) per JESD 51-8

It is recommended that users employ thermal modeling analysis to assist in applying the general recommendations to their particular application. The exposed pad of the MC100EP223 package does not have an electrical low impedance path to the substrate of the integrated circuit and its terminals.

OUTLINE DIMENSIONS

TC SUFFIX  
 PLASTIC LQFP PACKAGE, EXPOSED PAD  
 CASE 840K-01  
 ISSUE 0

- NOTES:
- DIMENSIONS ARE IN MILLIMETERS.
  - INTERPRET DIMENSIONS AND TOLERANCES PER ASME Y14.5M-1994.
  - DATUMS A, B AND D TO BE DETERMINED AT DATUM PLANE H.
  - DIMENSIONS D AND E TO BE DETERMINED AT SEATING PLANE C.
  - DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED THE MAXIMUM b DIMENSION BY MORE THAN 0.08 mm. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE FOOT. MINIMUM SPACE BETWEEN PROTRUSION AND ADJACENT LEAD OR PROTRUSION 0.07 mm.
  - DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25 mm PER SIDE. D1 AND E1 ARE MAXIMUM PLASTIC BODY SIZE DIMENSIONS INCLUDING MOLD MISMATCH. EXACT SHAPE OF EACH CORNER IS OPTIONAL.
  - THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.10 mm AND 0.25 mm FROM THE LEAD TIP.

DIM	MILLIMETERS	
	MIN	MAX
A	---	1.60
A1	0.05	0.15
