

Non-Volatile SRAM MODULE 2Mbit (128K x 16-Bit), 40pin-Dip, 5V
Part No. HMN12816D

GENERAL DESCRIPTION

The HMN12816D 128K x 16 nonvolatile SRAM's are 2,097,152-bit fully static, nonvolatile SRAM's, organized as 131,072 words by 16 bits. Each NVSRAM has a self contained lithium energy source and control circuitry which constantly monitors Vcc for an out-of-tolerance condition. When such a condition occurs, the lithium energy source is automatically switched on and write protection is unconditionally enabled to prevent data corruption. DIP-package HMN12816D devices can be used in place of solutions which build nonvolatile 128Kx16 memory by utilizing a variety of discrete components. There is no limit on the number of write cycles that can be executed and no additional support circuitry is required for microprocessor interfacing.

The HMN12816D uses extremely low standby current CMOS SRAM's, coupled with small lithium coin cells to provide non-volatility without long write-cycle times and the write-cycle limitations associated with EEPROM.

FEATURES

- ◆ Access time : 70, 85, 120, 150ns
- ◆ High-density design : 256KByte Design
- ◆ Battery internally isolated until power is applied
- ◆ Industry-standard 40-pin 128K x 16 pinout
- ◆ Unlimited write cycles
- ◆ Data retention in the absence of V_{CC}
- ◆ 10-years minimum data retention in absence of power
- ◆ Automatic write-protection during power-up/power-down cycles
- ◆ Data is automatically protected during power loss
- ◆ Conventional SRAM operation; unlimited write cycles

PIN ASSIGNMENT

40-pin Encapsulated Package

OPTIONS

- ◆ Timing
 - 70 ns
 - 85 ns
 - 120 ns
 - 150 ns

MARKING

- 150

FUNCTIONAL DESCRIPTION

The HMN12816D devices execute a read cycle whenever \overline{WE} (Write Enable) is inactive (high) and either/both of \overline{CEU} or \overline{CEL} (Chip Enables) are active (low) and \overline{OE} (Output Enable) is active (low). The unique address specified by the 17 address inputs (A0-A16) defines which of the 131,072 words of data is accessed. The status of \overline{CEU} and \overline{CEL} determines whether all or part of the addressed word is accessed. If \overline{CEU} is active with \overline{CEL} inactive, then only the upper byte of the addressed word is accessed. If \overline{CEU} is inactive with \overline{CEL} active, then only the lower byte of the addressed word is accessed. If both the \overline{CEU} and \overline{CEL} inputs are active (low), then the entire 16-bit word is accessed. Valid data will be available to the 16 data output drivers within t_{ACC} (Access Time) after the last address input signal is stable, providing that \overline{CEU} , \overline{CEL} and \overline{OE} access times are also satisfied. If \overline{CEU} , \overline{CEL} , and \overline{OE} access times are not satisfied, then data access must be measured from the later occurring signal, and the limiting parameter is either t_{CO} for \overline{CEU} , \overline{CEL} , or t_{OE} for \overline{OE} rather than address access.

The HMN12816D devices execute a write cycle whenever \overline{WE} and either/both of \overline{CEU} or \overline{CEL} are active (low) after address inputs are stable. The unique address specified by the 17 address inputs (A0-A16) defines which of the 131,072 words of data is accessed. The status of \overline{CEU} and \overline{CEL} determines whether all or part of the addressed word is accessed. If \overline{CEU} is active with \overline{CEL} inactive, then only the upper byte of the addressed word is accessed. If \overline{CEU} is inactive with \overline{CEL} active, then only the lower byte of the addressed word is accessed. If both the \overline{CEU} and \overline{CEL} inputs are active (low), then the entire 16-bit word is accessed. The write cycle is terminated by the earlier rising edge of \overline{CEU} and/or \overline{CEL} , or \overline{WE} . All address inputs must be kept valid throughout the write cycle. \overline{WE} must return to the high state for a minimum recovery time (t_{WR}) before another cycle can be initiated. The \overline{OE} control signal should be kept inactive (high) during write cycles to avoid bus contention. However, if the output drivers are enabled (\overline{CEU} and/or \overline{CEL} , and \overline{OE} active) then \overline{WE} will disable the outputs in t_{ODW} from its falling edge.

PIN DESCRIPTION

A₀-A₁₆ : Address Inputs

\overline{CEU} : Chip enable upper byte

\overline{CEL} : Chip enable lower byte

DQ₀-DQ₁₅ : Data input / Data output

\overline{WE} : Write enable

\overline{OE} : Output enable

V_{CC} : +5V power supply

V_{SS} : Ground

BLOCK DIAGRAM

READ/WRITE FUNCTION

/OE	/WE	/CEL	/CEU	VCC CURRENT	DQ0-DQ7	DQ8-DQ15	CYCLE PERFORMED
H	H	X	X	I_{CCO}	High-Z	High-Z	Output Disabled

DATA RETENTION MODE

The HMN12816D provides full functional capability for V_{CC} greater than 4.5 volts and write protects by 4.25volts. Data is maintained in the absence of V_{CC} without any additional support circuitry. The nonvolatile static RAMs constantly monitor V_{CC} . Should the supply volt-age decay, the NV SRAM's automatically write protect themselves, all inputs become "don't care," and all out-puts become high impedance. As V_{CC} falls below approximately 3.0 volts, a power switching circuit connects the lithium energy source to RAM to retain data. During power-up, when V_{CC} rises above approximately 3.0 volts, the power switching circuit connects external V_{CC} to RAM and disconnects the lithium energy source.

ABSOLUTE MAXIMUM RATINGS

PARAMETER	SYMBOL	RATING	CONDITIONS
DC voltage applied on V_{CC} relative to V_{SS}	V_{CC}	-0.3V to 7.0V	
DC Voltage applied on any pin excluding V_{CC} relative to V_{SS}	V_T	-0.3V to 7.0V	$V_T \leq V_{CC} + 0.3$
Operating temperature	T_{OPR}	0 to 70°C	
Storage temperature	T_{STG}	-40°C to 70°C	
Temperature under bias	T_{BIAS}	-10°C to 70°C	
Soldering temperature	T_{SOLDER}	260°C	For 10 second

NOTE: Permanent device damage may occur if Absolute Maximum Ratings are exceeded.

Functional operation should be restricted to the Recommended DC Operating Conditions detailed in this data sheet.

Exposure to higher than recommended voltage for extended periods of time could affect device reliability.

RECOMMENDED DC OPERATING CONDITIONS ($T_A = T_{OPR}$)

PARAMETER	SYMBOL	MIN	TYPICAL	MAX
Supply Voltage	V_{CC}	4.5V	5.0V	5.5V
Ground	V_{SS}	0	0	0
Input high voltage	V_{IH}	2.2	-	$V_{CC}+0.3V$
Input low voltage	V_{IL}	-0.3	-	0.8V

NOTE: Typical values indicate operation at $T_A = 25^\circ\text{C}$

DC ELECTRICAL CHARACTERISTICS ($T_A = 0^\circ\text{C}$ to 70°C)

PARAMETER	SYMBOL	MIN	TYP.	MAX	UNIT
Input Leakage Current	I_{IL}	-2.0	-	+2.0	μA
I/O Leakage Current $CE \geq V_{IH} \leq V_{CC}$	I_{IO}	-1.0	-	+1.0	μA
Output Current @ 2.4V	I_{OH}	-1.0	-	-	mA
Output Current @ 0.4V	I_{OL}	2.0	-	-	mA
Standby Current /CEU,/CEL=2.2V	I_{CCS1}	-	10	20	mA
Standby Current /CEU,/CEL= $V_{CC}-0.5V$	I_{CCS2}	-	6	10	mA
Operating Current	I_{CCO1}	-	-	170	mA

CAPACITANCE ($T_A = 25^\circ\text{C}$, $f = 1\text{MHz}$, $V_{CC} = 5.0V$)

DESCRIPTION	SYMBOL	MIN	TYP	MAX	UNITS
Input Capacitance	C_{IN}		20	25	pF
Input/Output Capacitance	$C_{I/O}$		5	10	pF

READ CYCLE ($T_A = T_{OPR}$, $V_{CCmin} \leq V_{CC} \leq V_{CCmax}$)

PARAMETER	SYMBOL	CONDITIONS	-70		-85		-120		-150		UNIT
			MIN	MAX	MIN	MAX	MIN	MAX	MIN	MAX	
Read Cycle Time	t_{RC}		70	-	85	-	120	-	150	-	ns
Address Access Time	t_{ACC}	Output load A	-	70	-	85	-	120	-	150	ns
Chip enable access time	t_{ACE}	Output load A	-	70	-	85	-	120	-	150	ns
Output enable to Output valid	t_{OE}	Output load A	-	35	-	45	-	60	-	70	ns
Chip enable to output in low Z	t_{CLZ}	Output load B	5	-	5	-	5	-	10	-	ns
Output enable to output in low Z	t_{OLZ}	Output load B	5	-	0	-	0	-	5	-	ns
Chip disable to output in high Z	t_{CHZ}	Output load B	0	25	0	35	0	45	0	60	ns
Output disable to output high Z	t_{OHZ}	Output load B	0	25	0	25	0	35	0	50	ns
Output hold from address change	t_{OH}	Output load A	10	-	10	-	10	-	10	-	ns

WRITE CYCLE ($T_A = T_{OPR}$, $V_{CCmin} \leq V_{CC} \leq V_{CCmax}$)

PARAMETER	SYMBOL	CONDITIONS	-70		-85		-120		-150		UNIT
			MIN	MAX	MIN	MAX	MIN	MAX	Min	Max	
Write Cycle Time	t_{WC}		70	-	85	-	120	-	150	-	ns
Chip enable to end of write	t_{CW}	Note 1	65	-	75	-	100	-	100	-	ns
Address setup time	t_{AS}	Note 2	0	-	0	-	0	-	0	-	ns
Address valid to end of write	t_{AW}	Note 1	65	-	75	-	100	-	90	-	ns
Write pulse width	t_{WP}	Note 1	55	-	65	-	85	-	90	-	ns
Write recovery time (write cycle 1)	t_{WR1}	Note 3	5	-	5	-	5	-	5	-	ns
Write recovery time (write cycle 2)	t_{WR2}	Note 3	15	-	15	-	15	-	15	-	ns
Data valid to end of write	t_{DW}		30	-	35	-	45	-	50	-	ns
Data hold time (write cycle 1)	t_{DH1}	Note 4	0	-	0	-	0	-	0	-	ns
Data hold time (write cycle 2)	t_{DH2}	Note 4	10	-	10	-	10	-	0	-	ns
Write enabled to output in high Z	t_{WZ}	Note 5	0	25	0	30	0	40	0	50	ns
Output active from end of write	t_{OW}	Note 5	5	-	0	-	0	-	5	-	ns

NOTE: 1. A write ends at the earlier transition of /CE going high and /WE going high.

2. A write occurs during the overlap of allow /CE and a low /WE. A write begins at the later transition of /CE going low and /WE going low.

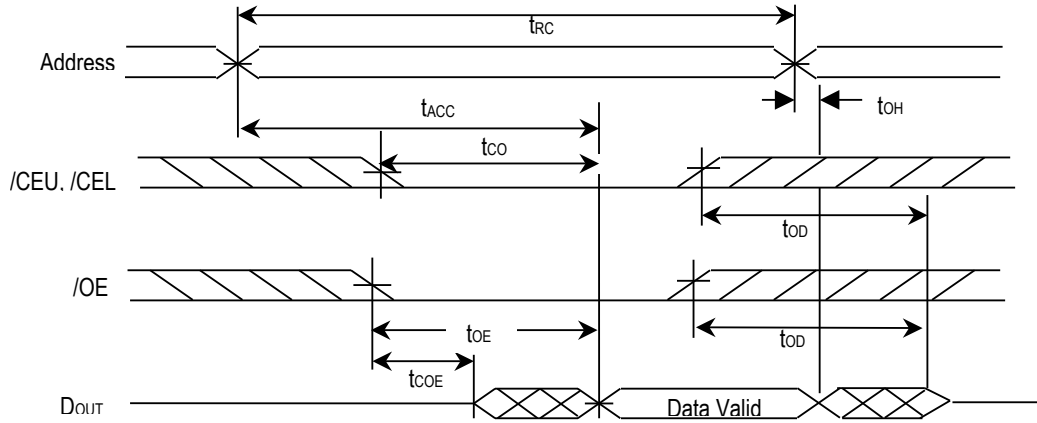

3. Either t_{WR1} or t_{WR2} must be met.

4. Either t_{DH1} or t_{DH2} must be met.

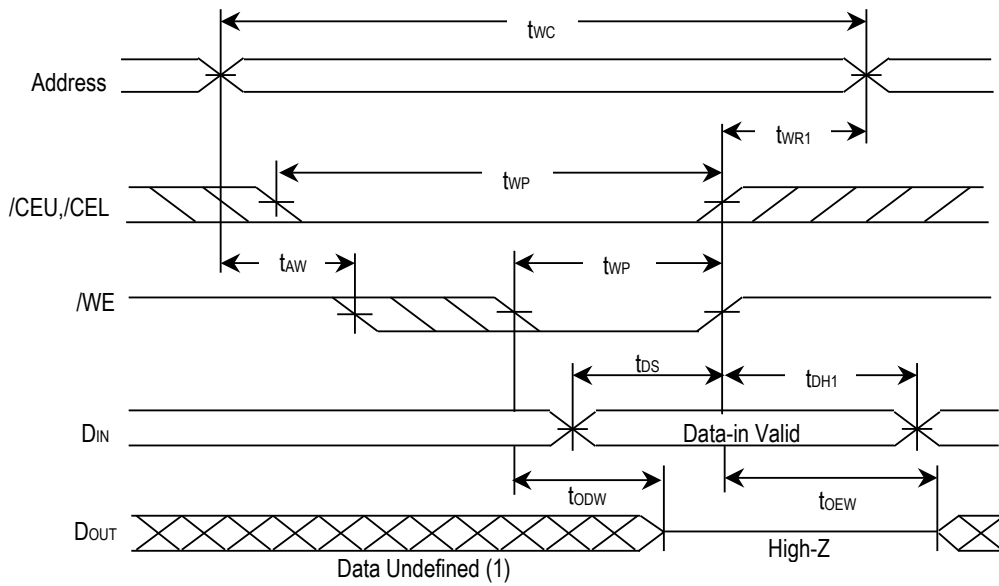

5. If /CE goes low simultaneously with /WE going low or after /WE going low, the outputs remain in high-impedance state.

TIMING WAVEFORM

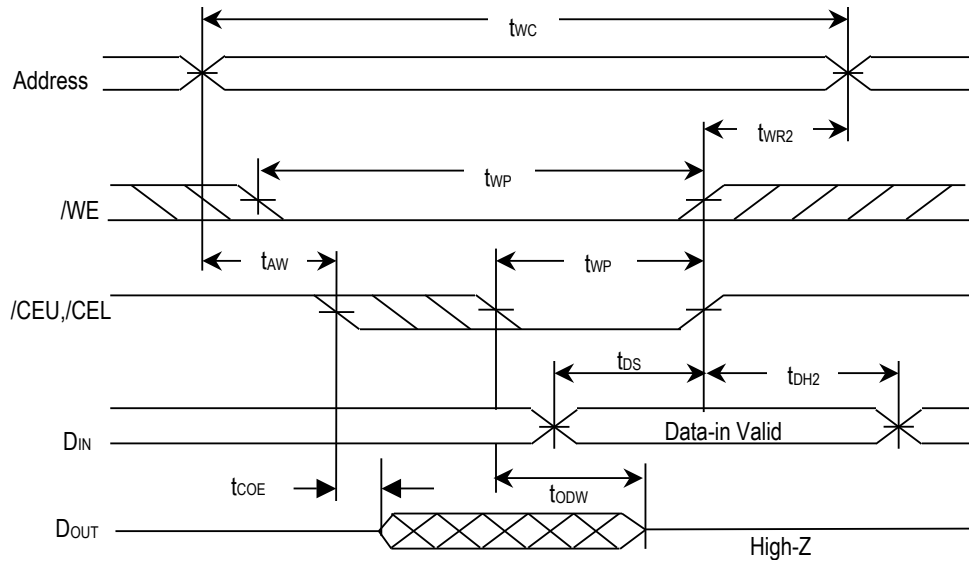

READ CYCLE

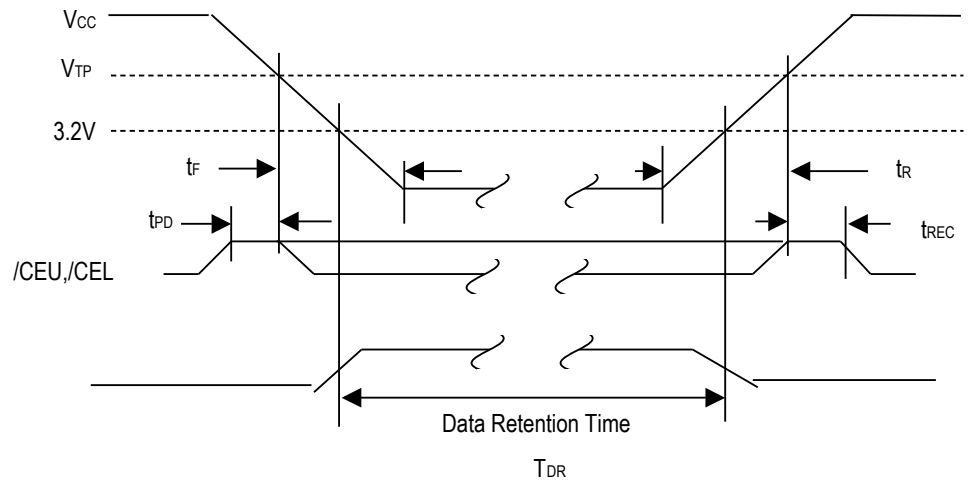

WRITE CYCLE NO.1

WRITE CYCLE NO.2

POWER-DOWN/POWER-UP CONDITION

POWER-DOWN/POWER-UP TIMING($t_A = 0^{\circ}\text{C}$ to 70°C)

PARAMETER	SYMBOL	MIN	TYP.	MAX	UNITS	NOTES
/CEU,/CEL at V_{IH} before Power-Down	t_{PD}	0	-	-	us	11
V_{CC} Slew from V_{TP} to 0V	t_F	300	-	-	us	-
V_{CC} Slew from 0V to V_{TP}	t_R	300	-	-	us	-
/CEU,/CEL at V_{IH} after Power-Up	t_{REC}	2	-	125	us	-

(t_A = 25^oC)

PARAMETER	SYMBOL	MIN	TYP	MAX	UNITS	NOTES
Expected Data Retention Time	t_{DR}	10	-	-	years	9

WARNING:

Under no circumstance are negative undershoots, of any amplitude, allowed when device is in battery backup mode.

NOTES:

1. /WE is high for a read cycle.
2. /OE = V_{IH} or V_{IL} . If /OE = V_{IH} during write cycle, the output buffers remain in a high impedance state.
3. t_{WP} is specified as the logical and of /CEU or /CEL and /WE. t_{WP} is measured from the latter of /CEU, /CEL or /WE going low to the earlier of /CEU, /CEL or /WE going high.
4. t_{DS} is measured from the earlier of /CEU or /CEL or /WE going high.
5. These parameters are sampled with a 5 pF load and are not 100% tested.
6. If the /CEU or /CEL low transition occurs simultaneously with or later than the /WE low transition in the output buffers remain in a high impedance state during this period.
7. If the /CEU or /CEL high transition occurs prior to or simultaneously with the /WE high transition, the output buffers remain in high impedance state during this period.
8. If /WE is low or the /WE low transition occurs prior to or simultaneously with the /CEU or /CEL low transition, the output buffers remain in a high impedance state during this period.
9. Each HMN12816D has a built-in switch that disconnects the lithium source until V_{CC} is first applied by the user.
The expected t_{DR} is defined as accumulative time in the absence of V_{CC} starting from the time power is first applied by the user.
10. All AC and DC electrical characteristics are valid over the full operating temperature range 0_C to 70_C.
11. In a power down condition the voltage on any pin may not exceed the voltage on Vcc .
12. t_{WR1} , t_{DH1} are measured from /WE going high.
13. t_{WR2} , t_{DH2} are measured from /CEU or /CEL going high.
