General Description

TS34063 is a monolithic switching regulator and subsystem intended for use as DC to DC converter. It contains an internal temperature compensated reference, comparator, controlled duty cycle oscillator with an active peak current limit circuit, drive and a high current output switch.

The TS34063 is specifically designed to be incorporated in step-up, step-down and voltage inverting converter applications. TS34063 is offered in SOP-8 and DIP-8 package

Features

- Power forward control circuit
- Operating voltage from 3V to 40V
- Low standby current
- Current limit adjustable
- Output switch current up to 1.5A
- Variable oscillator frequency up to 100kHz (max.)
- Output voltage adjustable

Pin Description

Name	Description
SC	Switch Collector
SE	Switch Emitter
CT	Timing Capacitor
GND	Ground
COMP.	Comparator Inverting Input
V _{CC}	V _{CC} Collector
I _{PK}	IPK Sense
V _{DRIVER}	Driver

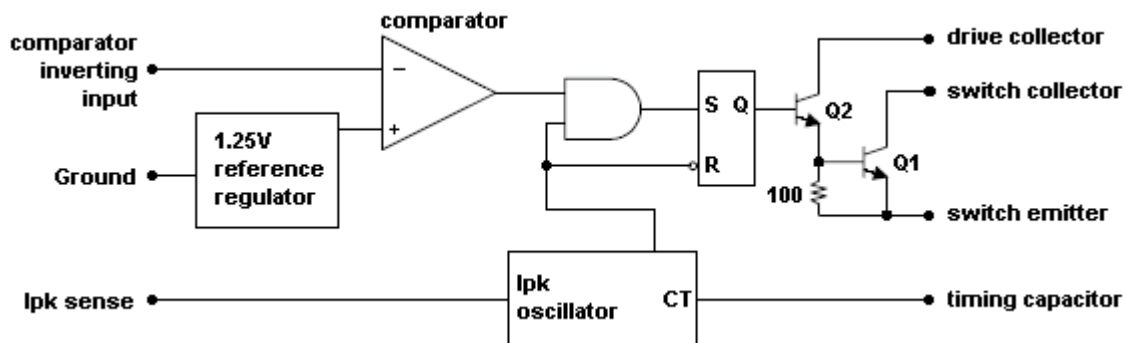

Applications

- Charger
- xD-ROM, xDSL products
- DC to DC converter

Notes1: Low duty cycle pulse techniques are used during test to maintain junction temperature as close to ambient temperature as possible

Note 2: If the output switch is driven into hard saturation (non-Darlington configuration) at low switch currents ($\leq 300mA$) and high driver currents ($\geq 30mA$), it may take up to 2uS for it to come out of saturation. This condition will shorten the off time at frequencies $\geq 30KHz$, and is magnified at high temperature. This condition does not occur with a Darlington configuration, since the output switch cannot saturate. If a non-darlington configuration is used, the following output drive condition is recommended: Forced Beta of output switch: $I_c \text{ output} / (I_c \text{ driver} - 7mA^*) \geq 10$

* The 100ohm resistor in the emitter of the driver divide requires about 7mA before the output switch conducts.

Terms and Definitions

- V_{sat} = Saturation Voltage of the output switch.
- V_f = Forward Voltage drop of the rectifier.
The following power supply characteristics must be chosen:
- V_{in} = Normal input voltage
- V_{out}: Desired Output voltage, $|V_{out}| = 1.25 (1 + R_2 / R_1)$
- I_{out} : Desired output current.
- f_{min} : Minimum desired output switching frequency at the selected values for V_{in} and I_o.
- V_{ripple(p-p)}: Desired peak-to-peak output ripple voltage. in practice, the calculated capacitor value will need to be increased due to its equivalent series resistance and board layout. The ripple voltage should be kept to a low value since it will directly affect the line and load regulation.
