### 3.3V 8K/16K x 9 Synchronous Dual Port Static RAM

## Features

- True Dual-Ported memory cells which allow simultaneous access of the same memory location
- Two Flow-Through/Pipelined devices
- 8K x 9 organization (CY7C09159AV)
— 16K x 9 organization (CY7C09169AV)
- Three Modes
- Flow-Through
- Pipelined
— Burst
- Pipelined output mode on both ports allows fast $83-\mathrm{MHz}$ operation
- 0.35-micron CMOS for optimum speed/power
- High-speed clock to data access 9 and 12 ns (max.)
- 3.3V Low operating power
- Active $=135 \mathrm{~mA}$ (typical)
- Standby $=10 \mu \mathrm{~A}$ (typical)
- Fully synchronous interface for easier operation
- Burst counters increment addresses internally
- Shorten cycle times
- Minimize bus noise
- Supported in Flow-Through and Pipelined modes
- Dual Chip Enables for easy depth expansion
- Automatic power-down
- Commercial and industrial temperature ranges
- Available in 100-pin TQFP
- Pb-Free packages available

## Functional Description

The CY7C09159AV and CY7C09169AV are high-speed synchronous CMOS 8K and 16K x 9 dual-port static RAMs. Two ports are provided, permitting independent, simultaneous access for reads and writes to any location in memory. ${ }^{[2]}$ Registers on control, address, and data lines allow for minimal set-up and hold times. In pipelined output mode, data is registered for decreased cycle time. Clock to data valid $\mathrm{t}_{\mathrm{CD2}}=9 \mathrm{~ns}$ (pipelined). Flow-through mode can also be used to bypass the pipelined output register to eliminate access latency. In flow-through mode data will be available $\mathrm{t}_{\mathrm{CD} 1}=18 \mathrm{~ns}$ after the address is clocked into the device. Pipelined output or flow-through mode is selected via the $\overline{\mathrm{FT}} /$ Pipe pin.

Each port contains a burst counter on the input address register. The internal write pulse width is independent of the LOW- to-HIGH transition of the clock signal. The internal write pulse is self-timed to allow the shortest possible cycle times.

A HIGH on $\overline{\mathrm{CE}}_{0}$ or LOW on $\mathrm{CE}_{1}$ for one clock cycle will power down the internal circuitry to reduce the static power consumption. The use of multiple Chip Enables allows easier banking of multiple chips for depth expansion configurations. In the pipelined mode, one cycle is required with $\overline{\mathrm{CE}}_{0}$ LOW and $\mathrm{CE}_{1}$ HIGH to reactivate the outputs.
Counter enable inputs are provided to stall the operation of the address input and utilize the internal address generated by the internal counter for fast interleaved memory applications. A port's burst counter is loaded with the port's Address Strobe (ADS). When the port's Count Enable (CNTEN) is asserted, the address counter will increment on each LOW-to-HIGH transition of that port's clock signal. This will read/write one word from/into each successive address location until CNTEN is deasserted. The counter can address the entire memory array and will loop back to the start. Counter Reset (CNTRST) is used to reset the burst counter.
All parts are available in 100-pin Thin Quad Plastic Flatpack (TQFP) packages.

Note:
2. When simultaneously writing to the same location, final value cannot be guaranteed.

## Pin Definitions

| Left Port | Right Port | Description |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{A}_{0 \mathrm{~L}}-\mathrm{A}_{13 \mathrm{~L}}$ | $\mathrm{A}_{0 \mathrm{R}}-\mathrm{A}_{13 \mathrm{R}}$ | Address Inputs ( $\mathrm{A}_{0}-\mathrm{A}_{12}$ for $8 \mathrm{~K} ; \mathrm{A}_{0}-\mathrm{A}_{13}$ for 16 K devices). |  |  |  |
| $\overline{\mathrm{ADS}}_{\mathrm{L}}$ | $\overline{\mathrm{ADS}}_{\mathrm{R}}$ | Address Strobe Input. Used as an address qualifier. This signal should be asserted LOW during normal read or write transactions. Asserting this signal LOW also loads the burst address counter with data present on the I/O pins. |  |  |  |
| $\overline{\overline{C E}}_{0 \mathrm{~L}}, \mathrm{CE}_{1 \mathrm{~L}}$ | $\overline{\mathrm{CE}}_{0 \mathrm{R}}, \mathrm{CE}_{1 \mathrm{R}}$ | Chip Enable Input. To select either the left or right port, both $\overline{\mathrm{CE}}_{0}$ AND $\mathrm{CE}_{1}$ must be asserted to their active states ( $\overline{\mathrm{CE}}_{0} \leq \mathrm{V}_{\mathrm{IL}}$ and $\left.\mathrm{CE}_{1} \geq \mathrm{V}_{\mathrm{IH}}\right)$. |  |  |  |
| $\mathrm{CLK}_{\mathrm{L}}$ | $\mathrm{CLK}_{\mathrm{R}}$ | Clock Signal. This input can be free-running or strobed. Maximum clock input rate is $\mathrm{f}_{\text {MAX }}$ - |  |  |  |
| $\overline{\text { CNTEN }}_{\text {L }}$ | $\overline{\text { CNTEN }}_{\text {R }}$ | Counter Enable Input. Asserting this signal LOW increments the burst address counter of its respective port on each rising edge of CLK. CNTEN is disabled if ADS or CNTRST are asserted LOW. |  |  |  |
| $\overline{\text { CNTRST }}_{\text {L }}$ | $\overline{\mathrm{CNTRST}}_{\mathrm{R}}$ | Counter Reset Input. Asserting this signal LOW resets the burst address counter of its respective port to zero. CNTRST is not disabled by asserting ADS or CNTEN. |  |  |  |
| $1 / \mathrm{O}_{0 \mathrm{~L}}-\mathrm{I} / \mathrm{O}_{8 \mathrm{~L}}$ | $\mathrm{I} / \mathrm{O}_{0 \mathrm{R}}-\mathrm{l} / \mathrm{O}_{8 \mathrm{R}}$ | Data Bus Input/Output ( $/ / \mathrm{O}_{0}-\mathrm{l} / \mathrm{O}_{7}$ for x 8 devices; $\mathrm{I} / \mathrm{O}_{0}-\mathrm{I} / \mathrm{O}_{8}$ for x 9 devices). |  |  |  |
| $\overline{\mathrm{OE}}_{\mathrm{L}}$ | $\overline{\mathrm{OE}}_{\mathrm{R}}$ | Output Enable Input. This signal must be asserted LOW to enable the I/O data pins during read operations. |  |  |  |
| $\mathrm{R} / \bar{W}_{\mathrm{L}}$ | $\mathrm{R} / \bar{W}_{\mathrm{R}}$ | Read/Write Enable Input. This signal is asserted LOW to write to the dual-port memory array. For read operations, assert this pin HIGH. |  |  |  |
| $\overline{\overline{\mathrm{FT}} / \mathrm{PIPE}_{\mathrm{L}}}$ | $\overline{\mathrm{FT}} / \mathrm{PIPE}_{R}$ | Flow-Through/Pipelined Select Input. For flow-through mode operation, assert this pin LOW. For pipelined mode operation, assert this pin HIGH. |  |  |  |
| GND |  | Ground Input. |  |  |  |
| NC |  | No Connect. |  |  |  |
| $\mathrm{V}_{\mathrm{CC}}$ |  | Power Input. |  |  |  |

## Switching Waveforms

Read Cycle for Flow-Through Output $\left(\overline{\mathrm{FT}} / \mathrm{PIPE}=\mathrm{V}_{\mathrm{IL}}\right)^{[7,8,9,10]}$

Read Cycle for Pipelined Operation $\left(\overline{\mathrm{FT}} / \mathrm{PIPE}=\mathrm{V}_{\mathrm{IH}}\right)^{[7,8,9,10]}$

Notes:
7. $\overline{\mathrm{OE}}$ is asynchronously controlled; all other inputs are synchronous to the rising clock edge.
8. $\overline{\mathrm{ADS}}=\mathrm{V}_{\mathrm{IL}}, \overline{\mathrm{CNTEN}}$ and $\overline{\mathrm{CNTRST}}=\mathrm{V}_{\mathrm{IH}}$
9. The output is disabled (high-impedance state) by $\mathrm{CE}_{0}=\mathrm{V}_{I H}$ or $\mathrm{CE}_{1}=\mathrm{V}_{\mathrm{IL}}$ following the next rising edge of the clock
10. Addresses do not have to be accessed sequentially since $A D S=V_{I L}$ constantly loads the address on the rising edge of the CLK. Numbers are for reference only.

## Notes:

17. Output state (HIGH, LOW, or High-Impedance) is determined by the previous cycle control signals.
18. $\overline{\mathrm{CE}}_{0}$ and $\overline{\mathrm{ADS}}=\mathrm{V}_{I L} ; \mathrm{CE}_{1}, \overline{\mathrm{CNTEN}}$, and $\overline{\mathrm{CNTRST}}=\mathrm{V}_{\mathrm{IH}}$.
19. During "No operation," data in memory at the selected address may be corrupted and should be rewritten to ensure data integrity.
