MCF532*x* ColdFire® Microprocessor Data Sheet

Features

- Version 3 ColdFire variable-length RISC processor core
- System debug support
- JTAG support for system level board testing
- On-chip memories
  - 16-Kbyte unified write-back cache
  - 32-Kbyte dual-ported SRAM on CPU internal bus, accessible by core and non-core bus masters (e.g., DMA, FEC, LCD controller, and USB host and OTG)
- Power management
- Liquid Crystal Display Controller (LCDC)
- Embedded Voice-over-IP (VoIP) system solution
- SDR/DDR SDRAM Controller
- Universal Serial Bus (USB) Host Controller
- Universal Serial Bus (USB) On-the-Go (OTG) controller
- Synchronous Serial Interface (SSI)
- Fast Ethernet Controller (FEC)
- Cryptography Hardware Accelerators
- FlexCAN Module
- Three Universal Asynchronous Receiver Transmitters (UARTs)
- I^2C Module
- Queued Serial Peripheral Interface (QSPI)
- Pulse Width Modulation (PWM) module
- Real Time Clock
- Four 32-bit DMA Timers
- Software Watchdog Timer
- Four Periodic Interrupt Timers (PITs)
- Phase Locked Loop (PLL)
- Interrupt Controllers (x2)
- DMA Controller
- FlexBus (External Interface)
- Chip Configuration Module (CCM)
- Reset Controller
- General Purpose I/O interface

3 Hardware Design Considerations

3.1 PLL Power Filtering

To further enhance noise isolation, an external filter is strongly recommended for PLL analog V_{DD} pins. The filter shown in Figure 2 should be connected between the board V_{DD} and the $PLLV_{DD}$ pins. The resistor and capacitors should be placed as close to the dedicated $PLLV_{DD}$ pin as possible.

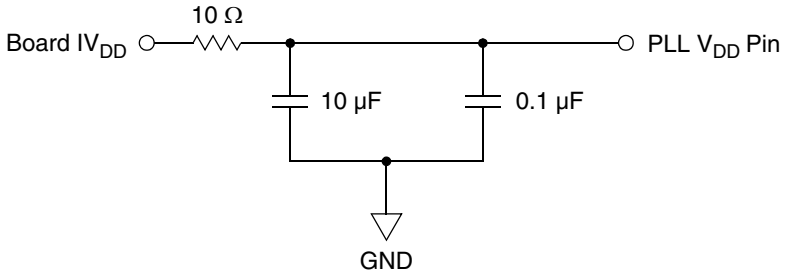

Figure 2. System PLL V_{DD} Power Filter

3.2 USB Power Filtering

To minimize noise, external filters are required for each of the USB power pins. The filter shown in Figure 3 should be connected between the board EV_{DD} or IV_{DD} and each of the $USBV_{DD}$ pins. The resistor and capacitors should be placed as close to the dedicated $USBV_{DD}$ pin as possible.

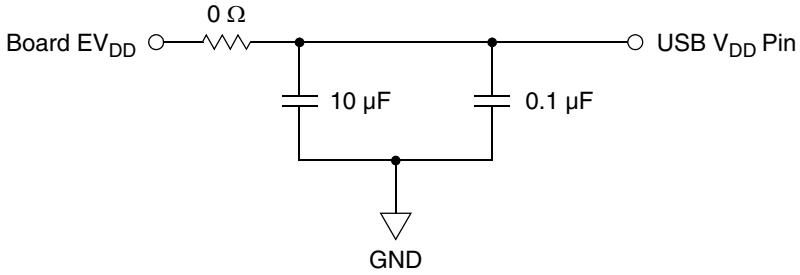

Figure 3. USB V_{DD} Power Filter

NOTE

In addition to the above filter circuitry, a 0.01 F capacitor is also recommended in parallel with those shown.

3.3 Supply Voltage Sequencing and Separation Cautions

The relationship between SDV_{DD} and EV_{DD} is non-critical during power-up and power-down sequences. SDV_{DD} (2.5V or 3.3V) and EV_{DD} are specified relative to IV_{DD}.

3.3.1 Power Up Sequence

If EV_{DD}/SDV_{DD} are powered up with IV_{DD} at 0 V, the sense circuits in the I/O pads cause all pad output drivers connected to the EV_{DD}/SDV_{DD} to be in a high impedance state. There is no limit on how long after EV_{DD}/SDV_{DD} powers up before IV_{DD} must powered up. IV_{DD} should not lead the EV_{DD}, SDV_{DD}, or $PLLV_{DD}$ by more than 0.4 V during power ramp-up or there is

high current in the internal ESD protection diodes. The rise times on the power supplies should be slower than 500 us to avoid turning on the internal ESD protection clamp diodes.

3.3.2 Power Down Sequence

If IV_{DD}/$PLLV_{DD}$ are powered down first, sense circuits in the I/O pads cause all output drivers to be in a high impedance state. There is no limit on how long after IV_{DD} and $PLLV_{DD}$ power down before EV_{DD} or SDV_{DD} must power down. IV_{DD} should not lag EV_{DD}, SDV_{DD}, or $PLLV_{DD}$ going low by more than 0.4 V during power down or there is undesired high current in the ESD protection diodes. There are no requirements for the fall times of the power supplies.

The recommended power down sequence is as follows:

1. Drop IV_{DD}/$PLLV_{DD}$ to 0 V.
2. Drop EV_{DD}/SDV_{DD} supplies.

4 Pin Assignments and Reset States

4.1 Signal Multiplexing

The following table lists all the MCF532*x* pins grouped by function. The Dir column is the direction for the primary function of the pin only. Refer to Section 7, "Package Information," for package diagrams. For a more detailed discussion of the MCF532*x* signals, consult the *MCF5329 Reference Manual* (MCF5329RM).

NOTE

In this table and throughout this document, a single signal within a group is designated without square brackets (i.e., A23), while designations for multiple signals within a group use brackets (i.e., A[23:21]) and is meant to include all signals within the two bracketed numbers when these numbers are separated by a colon.

NOTE

The primary functionality of a pin is not necessarily its default functionality. Pins that are muxed with GPIO default to their GPIO functionality.

1 Refers to pin's primary function.

2 Pull-up enabled internally on this signal for this mode.

3 The SDRAM functions of these signals are not programmable by the user. They are dynamically switched by the processor when accessing SDRAM memory space and are included here for completeness.

4 Primary functionality selected by asserting the DRAMSEL signal (SDR mode). Alternate functionality selected by negating the DRAMSEL signal (DDR mode). The GPIO module is not responsible for assigning these pins.

5 GPIO functionality is determined by the edge port module. The GPIO module is only responsible for assigning the alternate functions.

6 If JTAG_EN is asserted, these pins default to Alternate 1 (JTAG) functionality. The GPIO module is not responsible for assigning these pins.

7 Pull-down enabled internally on this signal for this mode.

8 Must be left floating for proper operation of the PLL.

5 Electrical Characteristics

This document contains electrical specification tables and reference timing diagrams for the MCF5329 microcontroller unit. This section contains detailed information on power considerations, DC/AC electrical characteristics, and AC timing specifications of MCF5329.

The electrical specifications are preliminary and are from previous designs or design simulations. These specifications may not be fully tested or guaranteed at this early stage of the product life cycle. However, for production silicon, these specifications will be met. Finalized specifications will be published after complete characterization and device qualifications have been completed.

NOTE

The parameters specified in this MCU document supersede any values found in the module specifications.

5.1 Maximum Ratings

Table 4. Absolute Maximum Ratings[1, 2]

Rating	Symbol	Value	Unit
Core Supply Voltage	IV_{DD}	– 0.5 to +2.0	V
CMOS Pad Supply Voltage	EV_{DD}	– 0.3 to +4.0	V
DDR/Memory Pad Supply Voltage	SDV_{DD}	– 0.3 to +4.0	V
PLL Supply Voltage	$PLLV_{DD}$	– 0.3 to +2.0	V
Digital Input Voltage [3]	V_{IN}	– 0.3 to +3.6	V
Instantaneous Maximum Current Single pin limit (applies to all pins) [3, 4, 5]	I_D	25	mA
Operating Temperature Range (Packaged)	T_A (T_L - T_H)	– 40 to +85	°C
Storage Temperature Range	T_{stg}	– 55 to +150	°C

1 Functional operating conditions are given in Section 5.4, "DC Electrical Specifications." Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Continued operation at these levels may affect device reliability or cause permanent damage to the device.

2 This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (V_{SS} or EV_{DD}).

3 Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, and then use the larger of the two values.

4 All functional non-supply pins are internally clamped to V_{SS} and EV_{DD}.

5 Power supply must maintain regulation within operating EV_{DD} range during instantaneous and operating maximum current conditions. If positive injection current ($V_{in} > EV_{DD}$) is greater than I_{DD}, the injection current may flow out of EV_{DD} and could result in external power supply going out of regulation. Ensure external EV_{DD} load shunts current greater than maximum injection current. This is the greatest risk when the MCU is not consuming power (ex; no clock). Power supply must maintain regulation within operating EV_{DD} range during instantaneous and operating maximum current conditions.

5.2 Thermal Characteristics

Table 5. Thermal Characteristics

Characteristic		Symbol	256MBGA	196MBGA	Unit
Junction to ambient, natural convection	Four layer board (2s2p)	θ_{JMA}	37[1,2]	42[1,2]	°C/W
Junction to ambient (@200 ft/min)	Four layer board (2s2p)	θ_{JMA}	34[1,2]	38[1,2]	°C/W
Junction to board	—	θ_{JB}	27[3]	32[3]	°C/W
Junction to case	—	θ_{JC}	16[4]	19[4]	°C/W
Junction to top of package	—	Ψ_{jt}	4[1,5]	5[1,5]	°C/W
Maximum operating junction temperature	—	T_j	105	105	°C

1 θ_{JMA} and Ψ_{jt} parameters are simulated in conformance with EIA/JESD Standard 51-2 for natural convection. Freescale recommends the use of θ_{JmA} and power dissipation specifications in the system design to prevent device junction temperatures from exceeding the rated specification. System designers should be aware that device junction temperatures can be significantly influenced by board layout and surrounding devices. Conformance to the device junction temperature specification can be verified by physical measurement in the customer's system using the Ψ_{jt} parameter, the device power dissipation, and the method described in EIA/JESD Standard 51-2.

2 Per JEDEC JESD51-6 with the board horizontal.

3 Thermal resistance between the die and the printed circuit board in conformance with JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.

4 Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).

5 Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written in conformance with Psi-JT.

The average chip-junction temperature (T_J) in °C can be obtained from:

$$T_J = T_A + (P_D \times \Theta_{JMA}) \quad \textit{Eqn. 1}$$

Where:

T_A = Ambient Temperature, °C
Q_{JMA} = Package Thermal Resistance, Junction-to-Ambient, °C/W
P_D = $P_{INT} + P_{I/O}$
P_{INT} = $I_{DD} \times IV_{DD}$, Watts - Chip Internal Power
$P_{I/O}$ = Power Dissipation on Input and Output Pins — User Determined

For most applications $P_{I/O} < P_{INT}$ and can be ignored. An approximate relationship between P_D and T_J (if $P_{I/O}$ is neglected) is:

$$P_D = \frac{K}{(T_J + 273°C)} \quad \textit{Eqn. 2}$$

Solving equations 1 and 2 for K gives:

$$K = P_D \times (T_A \times 273°C) + Q_{JMA} \times P_D^2 \quad \textit{Eqn. 3}$$

where K is a constant pertaining to the particular part. K can be determined from Equation 3 by measuring P_D (at equilibrium) for a known T_A. Using this value of K, the values of P_D and T_J can be obtained by solving Equation 1 and Equation 2 iteratively for any value of T_A.

5.3 ESD Protection

Table 6. ESD Protection Characteristics[1, 2]

Characteristics	Symbol	Value	Units
ESD Target for Human Body Model	HBM	2000	V

1 All ESD testing is in conformity with CDF-AEC-Q100 Stress Test Qualification for Automotive Grade Integrated Circuits.

2 A device is defined as a failure if after exposure to ESD pulses the device no longer meets the device specification requirements. Complete DC parametric and functional testing is performed per applicable device specification at room temperature followed by hot temperature, unless specified otherwise in the device specification.

1 The maximum allowable input clock frequency when booting with the PLL enabled is 24MHz. For higher input clock frequencies the processor must boot in LIMP mode to avoid violating the maximum allowable CPU frequency.

2 All internal registers retain data at 0 Hz.

3 This parameter is guaranteed by characterization before qualification rather than 100% tested.

4 Proper PC board layout procedures must be followed to achieve specifications.

5 This parameter is guaranteed by design rather than 100% tested.

6 This specification is the PLL lock time only and does not include oscillator start-up time.

7 C_{PCB_EXTAL} and C_{PCB_XTAL} are the measured PCB stray capacitances on EXTAL and XTAL, respectively.

8 Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum f_{sys}. Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the PLL circuitry via PLL V_{DD}, EV_{DD}, and V_{SS} and variation in crystal oscillator frequency increase the Cjitter percentage for a given interval.

9 Values are with frequency modulation disabled. If frequency modulation is enabled, jitter is the sum of Cjitter+Cmod.

10 Modulation percentage applies over an interval of 10 μs, or equivalently the modulation rate is 100 KHz.

11 Modulation range determined by hardware design.

5.6 External Interface Timing Characteristics

Table 9 lists processor bus input timings.

NOTE

All processor bus timings are synchronous; that is, input setup/hold and output delay with respect to the rising edge of a reference clock. The reference clock is the FB_CLK output.

All other timing relationships can be derived from these values. Timings listed in Table 9 are shown in Figure 7 and Figure 8.

* The timings are also valid for inputs sampled on the negative clock edge.

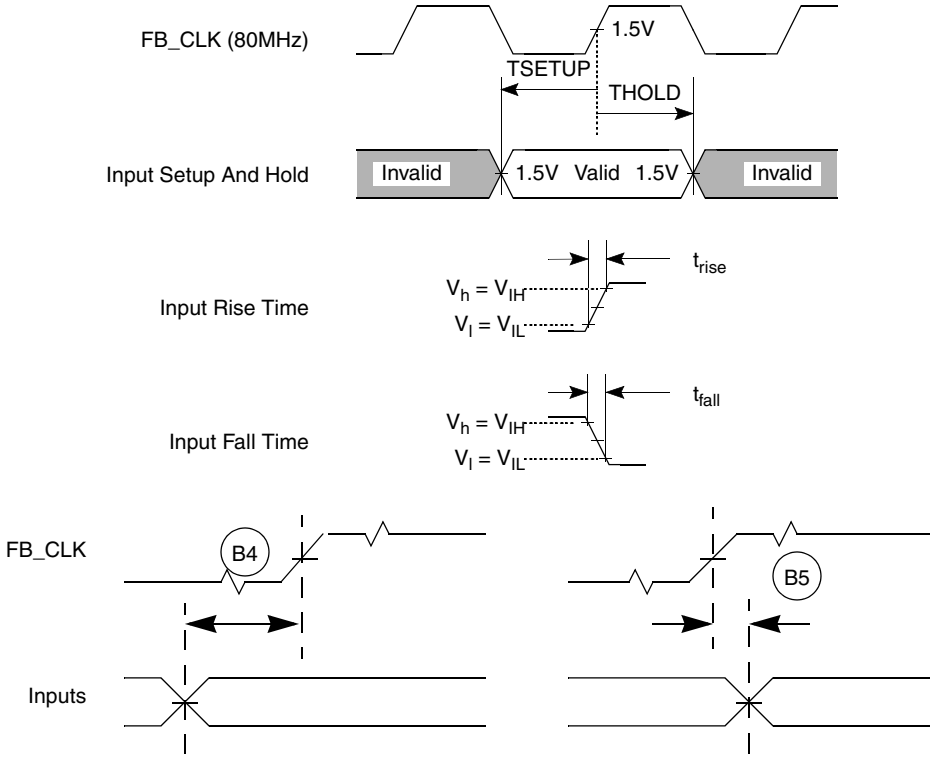

Figure 6. General Input Timing Requirements

5.6.1 FlexBus

A multi-function external bus interface called FlexBus is provided with basic functionality to interface to slave-only devices up to a maximum bus frequency of 80MHz. It can be directly connected to asynchronous or synchronous devices such as external boot ROMs, flash memories, gate-array logic, or other simple target (slave) devices with little or no additional circuitry. For asynchronous devices a simple chip-select based interface can be used. The FlexBus interface has six general purpose chip-selects ($\overline{FB\_CS}$[5:0]) which can be configured to be distributed between the FlexBus or SDRAM memory interfaces. Chip-select, $\overline{FB\_CS0}$ can be dedicated to boot ROM access and can be programmed to be byte (8 bits), word (16 bits), or longword (32 bits) wide. Control signal timing is compatible with common ROM/flash memories.

5.6.1.1 FlexBus AC Timing Characteristics

The following timing numbers indicate when data is latched or driven onto the external bus, relative to the system clock.

Table 9. FlexBus AC Timing Specifications

FB6	Transfer Acknowledge ($\overline{TA}$) Input Setup	t_{CVFBCH}	4	—	ns
FB7	Transfer Acknowledge ($\overline{TA}$) Input Hold	t_{CIFBCH}	0	—	ns

1 Timing for chip selects only applies to the $\overline{FB\_CS}$[5:0] signals. Please see Section 5.7.2, "DDR SDRAM AC Timing Characteristics" for SD_CS[3:0] timing.

2 The FlexBus supports programming an extension of the address hold. Please consult the *Reference Manual* for more information.

NOTE

The processor drives the data lines during the first clock cycle of the transfer with the full 32-bit address. This may be ignored by standard connected devices using non-multiplexed address and data buses. However, some applications may find this feature beneficial.

The address and data busses are muxed between the FlexBus and SDRAM controller. At the end of the read and write bus cycles the address signals are indeterminate.

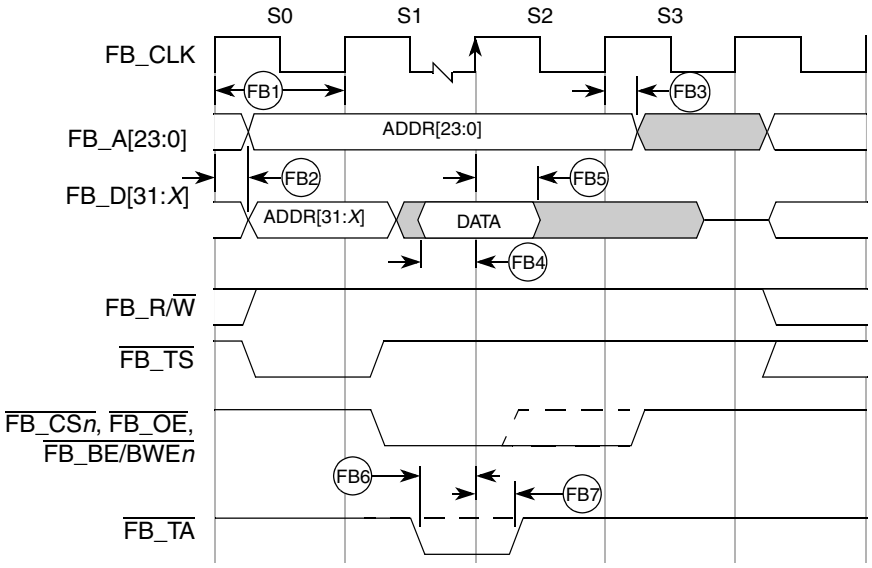

Figure 7. FlexBus Read Timing

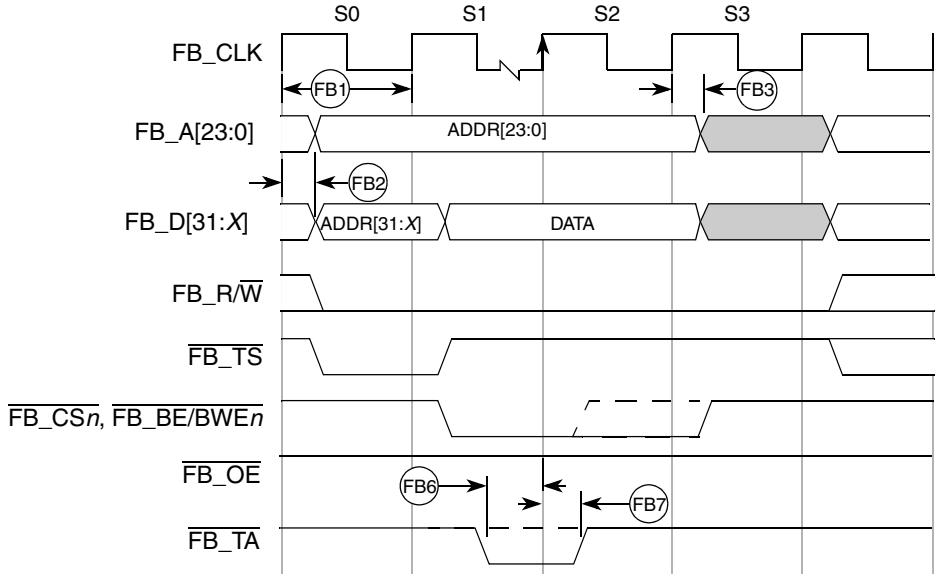

Figure 8. FlexBus Write Timing

5.7 SDRAM Bus

The SDRAM controller supports accesses to main SDRAM memory from any internal master. It supports standard SDRAM or double data rate (DDR) SDRAM, but it does not support both at the same time.

5.7.1 SDR SDRAM AC Timing Characteristics

The following timing numbers indicate when data is latched or driven onto the external bus, relative to the memory bus clock, when operating in SDR mode on write cycles and relative to SD_DQS on read cycles. The device's SDRAM controller is a DDR controller that has an SDR mode. Because it is designed to support DDR, a DQS pulse must remain supplied to the device for each data beat of an SDR read. The processor accomplishes this by asserting a signal named SD_SDR_DQS during read cycles. Care must be taken during board design to adhere to the following guidelines and specs with regard to the SD_SDR_DQS signal and its usage.

Table 10. SDR Timing Specifications

1 The FlexBus and SDRAM clock operates at the same frequency of the internal bus clock. See the PLL chapter of the *MCF5329 Reference Manual* for more information on setting the SDRAM clock rate.

2 SD_CLK is one SDRAM clock in (ns).

3 Pulse width high plus pulse width low cannot exceed min and max clock period.

4 Pulse width high plus pulse width low cannot exceed min and max clock period.

5 SD_DQS is designed to pulse 0.25 clock before the rising edge of the memory clock. This is a guideline only. Subtle variation from this guideline is expected. SD_DQS only pulses during a read cycle and one pulse occurs for each data beat.

6 SDR_DQS is designed to pulse 0.25 clock before the rising edge of the memory clock. This spec is a guideline only. Subtle variation from this guideline is expected. SDR_DQS only pulses during a read cycle and one pulse occurs for each data beat.

7 The SDR_DQS pulse is designed to be 0.5 clock in width. The timing of the rising edge is most important. The falling edge does not affect the memory controller.

8 Because a read cycle in SDR mode uses the DQS circuit within the device, it is most critical that the data valid window be centered 1/4 clk after the rising edge of DQS. Ensuring that this happens results in successful SDR reads. The input setup spec is provided as guidance.

5.7.2 DDR SDRAM AC Timing Characteristics

When using the SDRAM controller in DDR mode, the following timing numbers must be followed to properly latch or drive data onto the memory bus. All timing numbers are relative to the four DQS byte lanes.

Table 11. DDR Timing Specifications

1 SD_CLK is one SDRAM clock in (ns).

2 Pulse width high plus pulse width low cannot exceed min and max clock period.

3 Command output valid should be 1/2 the memory bus clock (SD_CLK) plus some minor adjustments for process, temperature, and voltage variations.

4 This specification relates to the required input setup time of today's DDR memories. The processor's output setup should be larger than the input setup of the DDR memories. If it is not larger, the input setup on the memory is in violation. MEM_DATA[31:24] is relative to MEM_DQS[3], MEM_DATA[23:16] is relative to MEM_DQS[2], MEM_DATA[15:8] is relative to MEM_DQS[1], and MEM_[7:0] is relative MEM_DQS[0].

5 The first data beat is valid before the first rising edge of DQS and after the DQS write preamble. The remaining data beats are valid for each subsequent DQS edge.

6 This specification relates to the required hold time of today's DDR memories. MEM_DATA[31:24] is relative to MEM_DQS[3], MEM_DATA[23:16] is relative to MEM_DQS[2], MEM_DATA[15:8] is relative to MEM_DQS[1], and MEM_[7:0] is relative MEM_DQS[0].

7 Data input skew is derived from each DQS clock edge. It begins with a DQS transition and ends when the last data line becomes valid. This input skew must include DDR memory output skew and system level board skew (due to routing or other factors).

8 Data input hold is derived from each DQS clock edge. It begins with a DQS transition and ends when the first data line becomes invalid.

5.10 LCD Controller Timing Specifications

This sections lists the timing specifications for the LCD Controller.

Table 14. LCD_LSCLK Timing

Num	Parameter	Minimum	Maximum	Unit
T1	LCD_LSCLK Period	25	2000	ns
T2	Pixel data setup time	11	—	ns
T3	Pixel data up time	11	—	ns

Note: The pixel clock is equal to LCD_LSCLK / (PCD + 1). When it is in CSTN, TFT or monochrome mode with bus width is set and LCD_LSCLK is equal to the pixel clock. When it is in monochrome with other bus width settings, LCD_LSCLK is equal to the pixel clock divided by bus width. The polarity of LCD_LSCLK and LCD_LD signals can also be programmed.

Number	Description	Minimum	Value	Unit
T1	End of LCD_OE to beginning of LCD_VSYNC	T5+T6+T7-1	(VWAIT1·T2)+T5+T6+T7-1	Ts
T2	LCD_HSYNC period	—	XMAX+T5+T6+T7	Ts
T3	LCD_VSYNC pulse width	T2	VWIDTH·T2	Ts
T4	End of LCD_VSYNC to beginning of LCD_OE	1	(VWAIT2·T2)+1	Ts
T5	LCD_HSYNC pulse width	1	HWIDTH+1	Ts
T6	End of LCD_HSYNC to beginning to LCD_OE	3	HWAIT2+3	Ts
T7	End of LCD_OE to beginning of LCD_HSYNC	1	HWAIT1+1	Ts

Note: Ts is the LCD_LSCLK period. LCD_VSYNC, LCD_HSYNC and LCD_OE can be programmed as active high or active low. In Figure 16, all 3 signals are active low. LCD_LSCLK can be programmed to be deactivated during the LCD_VSYNC pulse or the LCD_OE deasserted period. In Figure 16, LCD_LSCLK is always active.

Note: XMAX is defined in number of pixels in one line.

Num	Description	Minimum	Value	Unit
T1	LCD_SPL/LCD_SPR pulse width	—	1	Ts
T2	End of LCD_LD of line to beginning of LCD_HSYNC	1	HWAIT1+1	Ts
T3	End of LCD_HSYNC to beginning of LCD_LD of line	4	HWAIT2 + 4	Ts
T4	LCD_CLS rise delay from end of LCD_LD of line	3	CLS_RISE_DELAY+1	Ts
T5	LCD_CLS pulse width	1	CLS_HI_WIDTH+1	Ts
T6	LCD_PS rise delay from LCD_CLS negation	0	PS_RISE_DELAY	Ts
T7	LCD_REV toggle delay from last LCD_LD of line	1	REV_TOGGLE_DELAY+1	Ts

Note: Falling of LCD_SPL/LCD_SPR aligns with first LCD_LD of line.
Note: Falling of LCD_PS aligns with rising edge of LCD_CLS.
Note: LCD_REV toggles in every LCD_HSYN period.

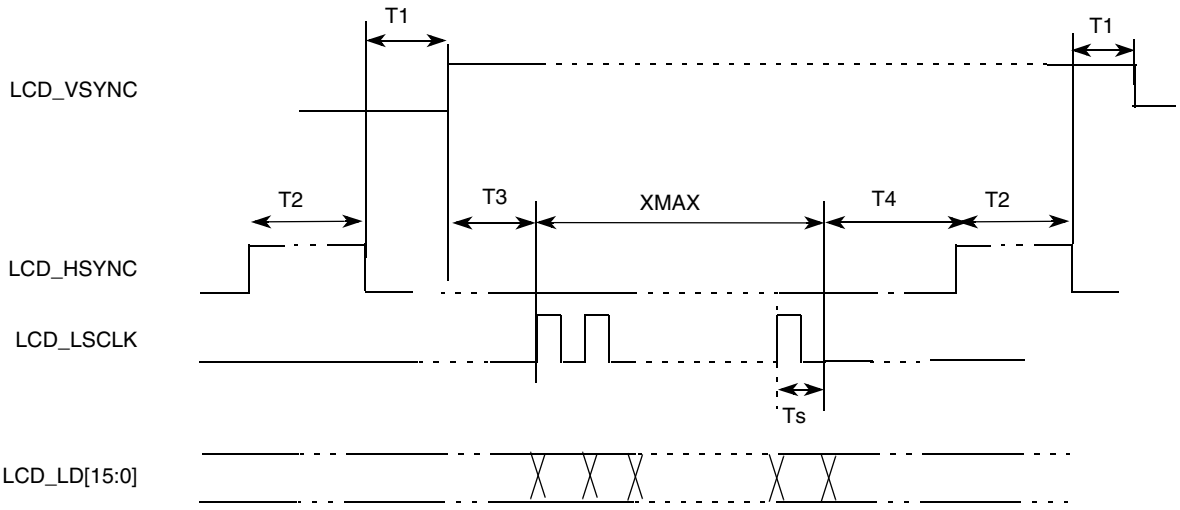

Figure 18. Non-TFT Mode Panel Timing

Table 17. Non-TFT Mode Panel Timing

Num	Description	Minimum	Value	Unit
T1	LCD_HSYNC to LCD_VSYNC delay	2	HWAIT2 + 2	Tpix
T2	LCD_HSYNC pulse width	1	HWIDTH + 1	Tpix
T3	LCD_VSYNC to LCD_LSCLK	—	0 ≤ T3 ≤ Ts	—
T4	LCD_LSCLK to LCD_HSYNC	1	HWAIT1 + 1	Tpix

Note: Ts is the LCD_LSCLK period while Tpix is the pixel clock period. LCD_VSYNC, LCD_HSYNC and LCD_LSCLK can be programmed as active high or active low. In Figure 18, all three signals are active high. When it is in CSTN mode or monochrome mode with bus width = 1, T3 = Tpix = Ts. When it is in monochrome mode with bus width = 2, 4 and 8, T3 = 1, 2 and 4 Tpix respectively.

5.11 USB On-The-Go

The MCF5329 device is compliant with industry standard USB 2.0 specification.

5.12 ULPI Timing Specification

Control and data timing requirements for the ULPI pins are given in Table 18. These timings apply in synchronous mode only. All timings are measured with either a 60 MHz input clock from the USB_CLKIN pin. The USB_CLKIN needs to maintain a 50% duty cycle. Control signals and 8-bit data are always clocked on the rising edge.

The ULPI interface on the MCF5329 processor is compliant with the industry standard definition.

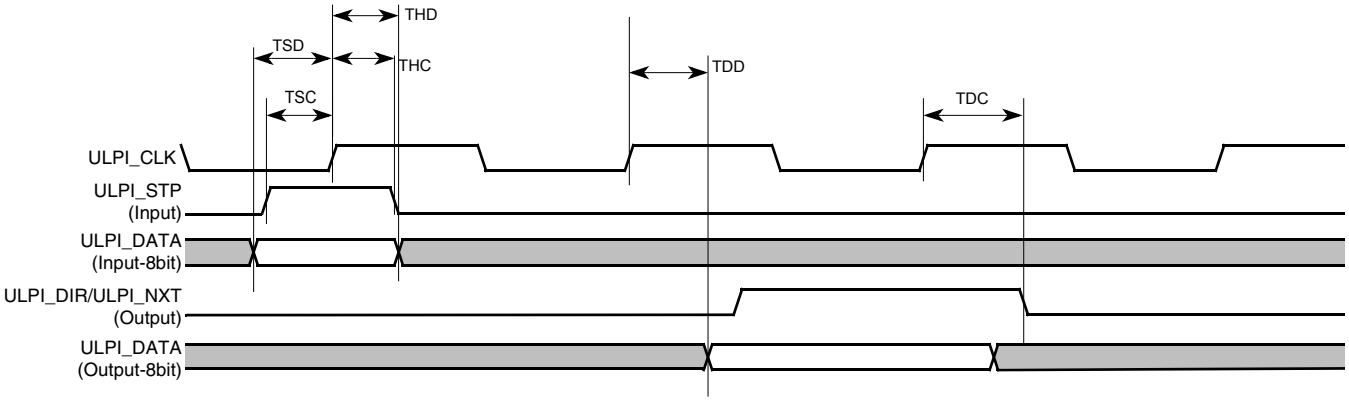

Figure 19. ULPI Timing Diagram

Table 18. ULPI Interface Timing

Parameter	Symbol	Min	Max	Units
Setup time (control in, 8-bit data in)	TSC, TSD	—	3.0	ns
Hold time (control in, 8-bit data in)	THC, THD	–1.5	—	ns
Output delay (control out, 8-bit data out)	TDC, TDD	—	6.0	ns

5.13 SSI Timing Specifications

This section provides the AC timings for the SSI in master (clocks driven) and slave modes (clocks input). All timings are given for non-inverted serial clock polarity (SSI_TCR[TSCKP] = 0, SSI_RCR[RSCKP] = 0) and a non-inverted frame sync (SSI_TCR[TFSI] = 0, SSI_RCR[RFSI] = 0). If the polarity of the clock and/or the frame sync have been inverted, all the timings remain valid by inverting the clock signal (SSI_BCLK) and/or the frame sync (SSI_FS) shown in the figures below.

Table 19. SSI Timing – Master Modes[1]

Num	Description	Symbol	Min	Max	Units

S9	SSI_RXD / SSI_FS input setup before SSI_BCLK		15	—	ns
S10	SSI_RXD / SSI_FS input hold after SSI_BCLK		0	—	ns

1 All timings specified with a capactive load of 25pF.

2 SSI_MCLK can be generated from SSI_CLKIN or a divided version of the internal system clock (SYSCLK).

3 SSI_BCLK can be derived from SSI_CLKIN or a divided version of SYSCLK. If the SYSCLK is used, the minimum divider is 6. If the SSI_CLKIN input is used, the programmable dividers must be set to ensure that SSI_BCLK does not exceed 4 x f_{SYS}.

1 Output numbers depend on the value programmed into the IFDR; an IFDR programmed with the maximum frequency (IFDR = 0x20) results in minimum output timings as shown in Table 22. The I²C interface is designed to scale the actual data transition time to move it to the middle of the SCL low period. The actual position is affected by the prescale and division values programmed into the IFDR; however, the numbers given in Table 22 are minimum values.

2 Because I2C_SCL and I2C_SDA are open-collector-type outputs, which the processor can only actively drive low, the time I2C_SCL or I2C_SDA take to reach a high level depends on external signal capacitance and pull-up resistor values.

3 Specified at a nominal 50-pF load.

Figure 22 shows timing for the values in Table 22 and Table 21.

1 All values are measured with a 3.30V EV_{DD}, 3.30V SDV_{DD} and 1.5V IV_{DD} power supplies. Tests performed at room temperature with pins configured for high drive strength.

2 Refer to the Power Management chapter in the *MCF532x Reference Manual* for more information on low-power modes.

3 All peripheral clocks except UART0, FlexBus, INTC0, reset controller, PLL, and edge port off before entering low power mode. All code executed from flash.

4 All peripheral clocks on before entering low power mode. All code is executed from flash.

5 See the description of the low-power control register (LCPR) in the *MCF532x Reference Manual* for more information on stop modes 0–3.

2 CPU polling a status register. All peripheral clocks except UART0, FlexBus, INTC0, reset controller, PLL, and edge port disabled.

3 Peak current measured while running a while(1) loop with all modules active.

Figure 35 shows the estimated maximum power consumption.

7 Package Information

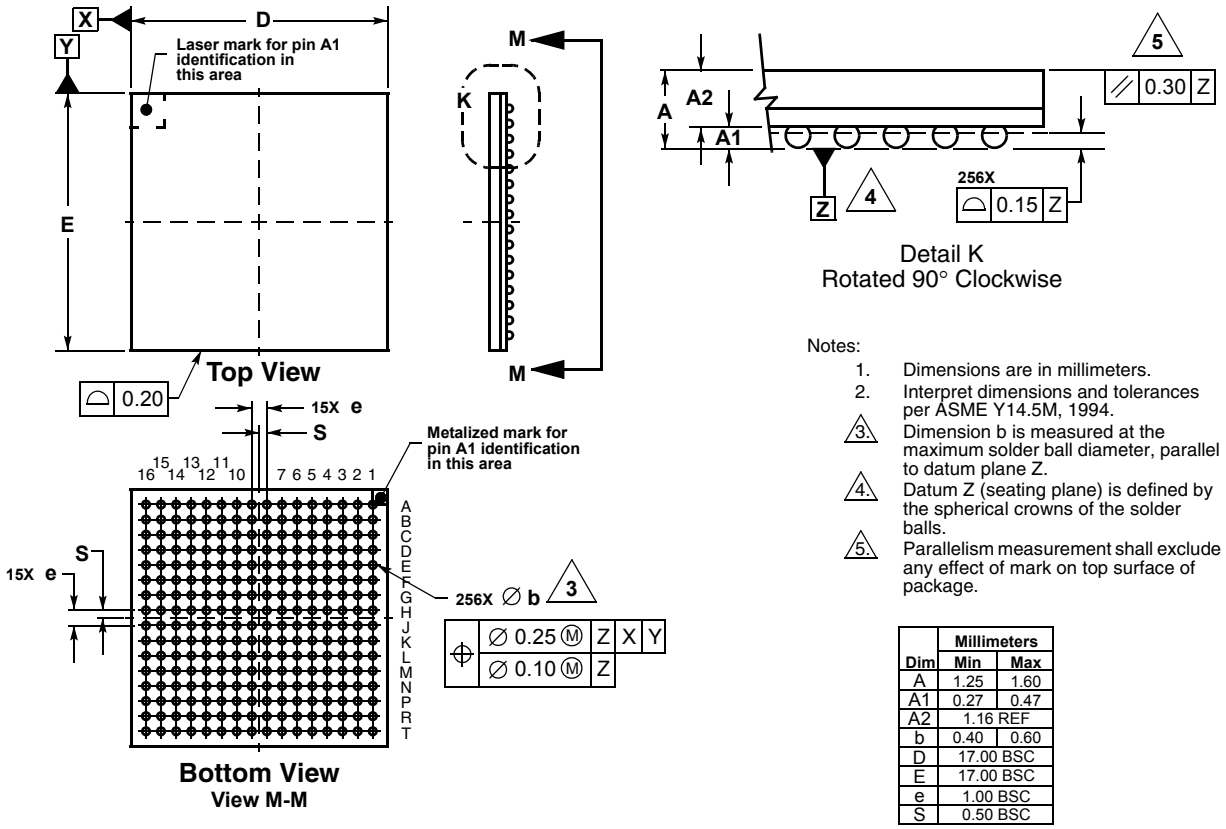
This section contains drawings showing the pinout and the packaging and mechanical characteristics of the MCF532*x* devices.

NOTE

The mechanical drawings are the latest revisions at the time of publication of this document. The most up-to-date mechanical drawings can be found at the product summary page located at http://www.freescale.com/coldfire.

7.1 Package Dimensions—256 MAPBGA

Figure 36 shows MCF5328CVM240, MCF53281CVM240, and MCF5329CVM240 package dimensions.



Dim	Millimeters	
	Min	Max
A	1.25	1.60
A1	0.27	0.47
A2	1.16 REF	
b	0.40	0.60
D	17.00 BSC	
E	17.00 BSC	
e	1.00 BSC	
S	0.50 BSC

8 Revision History

Table 33. MCF5329DS Document Revision History

Rev. No.	Substantive Changes	Date of Release
0	• Initial release.	11/2005
0.1	• Added not to Section 7, “Package Information.” • Added top view and bottom view where appropriate in mechanical drawings and pinout figures. • Figure 6: Corrected “FB_CLK (75MHz)” label to “FB_CLK (80MHz)”	3/2006
1	• Corrected MCF5327 196MAPBGA ball map locations in Table 5 for the following signals: RCON, D1, D0, OE, R/W, SD_DQS2, PSTCLK, DDATA[3:0], PST[3:0], EVDD, IVDD, and SD_VDD. Figure 5 was correct. • Updated thermal characteristic values in Table 5. • Updated DC electricals values in Table 7. • Updated Section 3.3, “Supply Voltage Sequencing and Separation Cautions” and subsections. • Updated and added Oscillator/PLL characteristics in Table 8. • Table 9: Swapped min/max for FB1; Removed FB8 & FB9. • Updated SDRAM write timing diagram, Figure 9. • Table 11: Added values for frequency of operation and DD1. • Reworded first paragraph in Section 5.12, “ULPI Timing Specification.” • Updated Figure 19. • Replaced figure & table Section 5.13, “SSI Timing Specifications,” with slave & master mode versions. • Removed second sentence from Section 5.15.2, “MII Transmit Signal Timing,” regarding no minimum frequency requirement for TXCLK. • Removed third and fourth paragraphs from Section 5.15.2, “MII Transmit Signal Timing,” as this feature is not supported on this device. • Updated figure & table Section 5.19, “Debug AC Timing Specifications.” • Renamed & moved previous version’s Section 5.5 “Power Consumption” to Section 6, “Current Consumption.” Added additional real-world data to this section as well.	7/2007
2	• Added MCF53281 device information throughout: features list, family configuration table, ordering information table, signals description table, and relevant package diagram titles • Remove Footnote 1 from Table 11. • Changed document type from Advance Information to Technical Data.	8/2007

Table 33. MCF5329DS Document Revision History (continued)

Rev. No.	Substantive Changes	Date of Release
3	• Corrected MCF53281 in features list table. This device contains CAN, but does not feature the cryptography accelerators. • In pin-multiplexing table, moved MCF53281 label from the MCF5328 column to the MCF5329 column, because this device contains CAN output signals.	10/2007
4	• Corrected pinouts in Table 5 for 196 MAPBGA device: Changed D[15:1] entry from “F4–F1, G4–G2...” to “F4–F1, G5–G2...” Changed DSO/TDO entry from “P9” to “N9” • Corrected D0 spec in Table 30 from 1.5 x t_{sys} to 2 x t_{sys} for min and max balues. • Updated FlexBus read and write timing diagrams in Figure 7 and Figure 8. • Removed footnote 2 from the IRQ[7:1] alternate functions USBHOST VBUS_EN, USBHOST VBUS_OC, SSI_MCLK, USB_CLKIN, and SSI_CLKIN signals in Table 5. • Updated pinouts for 196 MAPBGA device, MCF5327CVM240 in both Figure 5 and Table 2. The following locations are affected: G10–12, H12–14, J11–14, K12–13, L12–13, M12–14, N13. The following signals are affected: USBOTG_VDD, USBHOST_VSS, USBOTG_M, USBOTG_P, USBHOST_M, USBHOST_P, DRAMSEL, PWM3, PWM1, $\overline{\text{IRQ}}$[7,4,3,2,1], $\overline{\text{RESET}}$, TDI/DSI, JTAG_EN, TMS/$\overline{\text{BKPT}}$.	4/2008
