PRELIMINARY DATA

4-BIT D-TYPE REGISTER WITH 3-STATE OUTPUTS

DESCRIPTION

The T54LS173A/T74LS173A is a 4-Bit D-Type Register with 3-State outputs. The clock being fully edge-triggered allows either a load from the D inputs or a hold (retain register contents) depending on the state of the Input Enable Lines ($\overline{IE}_1, \overline{IE}_2$). HIGH on either Output Enable line ($\overline{OE}_1, \overline{OE}_2$) leads the output to a high impedance state without affecting the actual register contents. A HIGH on the Master Reset (MR) input resets the Register on a spite of the state of the clock (CP), the Output Enable ($\overline{OE}_1, \overline{OE}_2$) or the Input Enable ($\overline{IE}_1, \overline{IE}_2$) lines.

LOGIC SYMBOL AND LOGIC DIAGRAM

ABSOLUTE MAXIMUM RATINGS

Symbol	Parameter	Value	Unit
V_{CC}	Supply Voltage	-0.5 to 7	V
V_I	Input Voltage, Applied to Input	-0.5 to 15	V
V_O	Output Voltage, Applied to Output	0 to 10	V
I_I	Input Current, Into Inputs	-30 to 5	mA
I_O	Output Current, Into Outputs	50	mA

Stresses in excess of those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions in excess of those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

When either \overline{OE}_1 or \overline{OE}_2 are HIGH, the output is in the off state (High Impedance); however this does not affect the contents or sequential operation of the register.

Surface Mounted

T-90-20

One possible solution to the important problem of PWB minimization, is that of using surface mounted components. Integrated circuits in SO (Small Outline) packages are made up of standard chips mounted in very small plastic packages.

The advantages given by using these devices are:

PWB Reduction

This is by far the most important advantage since the reduction of PWB size varies from 40 to 60% in comparison with standard board types. (See page 584 for package dimensions.)

Assembly Cost Reduction

SO Devices require no preliminary operation prior to mounting and can therefore be easily utilized in fully automatic equipment.

Increasing Reliability

The following characteristics lead to a higher level of reliability with respect to their standard packaged counter parts:

- The mounting system is fully automatic
- PWB number and the interconnections between them are reduced when the same number of devices are used.
- The high density of components on the board makes it thermally much more stable.

Noise Reduction and Improved Frequency Response

The reduction of the length of the connecting wires between the leads and the silicon guarantees a more homogeneous propagation delay between the external pins, with respect to the standard type.

Assembly Without Board Holes

The devices are placed on the board and soldered. This technology permits a higher level of tolerance in the positioning (automatic) of the device. For the standard DIP types this must be done with great accuracy due to the insertion of the leads into their holes.
