## Table Contents

1.0 Ordering Information ..... 4
2.0 Key Features ..... 4
3.0 Package pinout/Mechanical Dimension \& Addressing ..... 5
3.1 x4 Package Pinout (Top view) : 94ball FBGA Package(78balls + 16 balls of support balls) ..... 5
$3.2 \times 8$ Package Pinout (Top view) : 94ball FBGA Package(78balls + 16 balls of support balls) .....  6
$3.3 \times 16$ Package Pinout (Top view) : 112ball FBGA Package(96balls + 16 balls of support balls) ..... 7
3.4 FBGA Package Dimension (x4) ..... 8
3.5 FBGA Package Dimension (x8) ..... 9
3.6 FBGA Package Dimension (x16) ..... 10
4.0 Input/Output Functional Description ..... 11
5.0 DDR3 SDRAM Addressing ..... 12
6.0 Absolute Maximum Ratings ..... 14
6.1 Absolute Maximum DC Ratings ..... 14
6.2 DRAM Component Operating Temperature Range ..... 14
7.0 AC \& DC Operating Conditions ..... 14
7.1 Recommended DC operating Conditions (SSTL_1.5) ..... 14
8.0 AC \& DC Input Measurement Levels ..... 15
8.1 AC and DC Logic input levels for single-ended signals ..... 15
8.2 Differential swing requirement for differntial signals ..... 16
8.2.1 Single-ended requirements for differential signals ..... 17
8.3 AC and DC logic input levels for Differential Signals ..... 18
8.4 Differential Input Cross Point Voltage ..... 18
8.5 Slew rate definition for Single Ended Input Signals ..... 19
8.5.1 Input Slew Rate for Input Setup Time (tIS) and Data Setup Time (tDS) ..... 19
8.5.2 Input Slew Rate for Input Hold Time (tIH) and Data Hold Time (tDH) ..... 19
8.6 Slew rate definition for Differential Input Signals ..... 19
9.0 AC and DC Output Measurement Levels ..... 20
9.1 Single Ended AC and DC Output Levels ..... 20
9.2 Differential AC and DC Output Levels ..... 20
9.3.Single Ended Output Slew Rate ..... 21
9.4 Differential Output Slew Rate ..... 21
9.5 Reference Load for AC Timing and Output Slew Rate ..... 22
9.6 Overshoot/Undershoot Specification ..... 23
9.6.1 Address and Control Overshoot and Undershoot specifications ..... 23
9.6.2 Clock, Data, Strobe and Mask Overshoot and Undershoot specifications ..... 23
9.734 ohm Output Driver DC Electrical Characteristics ..... 24
9.7.1 Output Drive Temperature and Voltage sensitivity ..... 25
9.8 On-Die Termination (ODT) Levels and I-V Characteristics ..... 25
9.8.1 ODT DC electrical characteristics ..... 26
9.8.2 ODT Temperature and Voltage sensitivity ..... 27
9.9 ODT Timing Definitions ..... 28
9.9.1 Test Load for ODT Timings ..... 28
9.9.2 ODT Timing Definition ..... 28
10.0 Idd Specification Parameters and Test Conditions ..... 31
10.1 IDD Measurement Conditions ..... 31
10.2 IDD Specifications ..... 41
11.0 Input/Output Capacitance ..... 43
12.0 Electrical Characteristics and AC timing for DDR3-800 to DDR3-1600 ..... 44
12.1 Clock specification ..... 44
12.2 Clock Jitter Specification ..... 45
12.3 Refresh Parameters by Device Density ..... 46
12.4 Standard Speed Bins ..... 46
13.0 Timing Parameters by Speed Grade ..... 48

### 1.0 Ordering Information

[ Table 1 ] Samsung DDR3 ordering information table

| Organization | DDR3-800 (6-6-6) | DDR3-1066 (7-7-7/8-8-8) | DDR3-1333 (8-8-8/9-9-9) | Package |
| :---: | :---: | :---: | :---: | :---: |
| $256 \mathrm{Mx4}$ | K4B1G0446C-ZCF7 | K4B1G0446C-CF8/G8 | K4B1G0446C-ZCG9/H9 | 94 FBGA |
| $128 \mathrm{Mx8}$ | K4B1G0846C-ZCF7 | K4B1G0846C-CF8/G8 | K4B1G0846C-ZCG9/H9 | 94 FBGA |
| $64 \mathrm{Mx16}$ | K4B1G1646C-ZCF7 | K4B1G1646C-CF8/G8 | K4B1G1646C-ZCG9/H9 | 112 FBGA |

Note :

1. Speed bin is in order of CL-tRCD-tRP.
2. $x 4 / \times 8 / x 16$ Package - including 16 support balls

### 2.0 Key Features

[ Table 2 ] 1Gb DDR3 C-die Speed bins

| Speed | DDR3-800 | DDR3-1066 |  | DDR3-1333 |  | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 6-6-6 | 7-7-7 | 8-8-8 | 8-8-8 | 9-9-9 |  |
| tCK(min) | 2.5 | 1.875 |  | 1.5 |  | ns |
| CAS Latency | 6 | 7 | 8 | 8 | 9 | tCK |
| tRCD (min) | 15 | 13.125 | 15 | 12 | 13.5 | ns |
| tRP(min) | 15 | 13.125 | 15 | 12 | 13.5 | ns |
| tRAS(min) | 37.5 | 37.5 | 37.5 | 36 | 36 | ns |
| tRC(min) | 52.5 | 50.625 | 52.5 | 48 | 49.5 | ns |

- JEDEC standard $1.5 \mathrm{~V} \pm 0.075 \mathrm{~V}$ Power Supply
- $\mathrm{VDDQ}=1.5 \mathrm{~V} \pm 0.075 \mathrm{~V}$
- 400 MHz f CK for $800 \mathrm{Mb} / \mathrm{sec} / \mathrm{pin}, 533 \mathrm{MHz} \mathrm{f}_{\mathrm{CK}}$ for $1066 \mathrm{Mb} / \mathrm{sec} /$ pin, $667 \mathrm{MHz} \mathrm{f}_{\mathrm{CK}}$ for $1333 \mathrm{Mb} / \mathrm{sec} /$ pin
- 8 Banks
- Posted CAS
- Programmable CAS Latency: $5,6,7,8,9,10$, (11 for high density only)
- Programmable Additive Latency: 0, CL-2 or CL-1 clock
- Programmable CAS Write Latency (CWL) $=5$ (DDR3-800), 6 (DDR3-1066), 7 (DDR3-1333)
- 8-bit pre-fetch
- Burst Length: 8 (Interleave without any limit, sequential with starting address "000" only), 4 with tCCD $=4$ which does not allow seamless read or write [either On the fly using A12 or MRS]
- Bi-directional Differential Data-Strobe
- Internal(self) calibration : Internal self calibration through ZQ pin (RZQ : 240 ohm $\pm 1 \%$ )
- On Die Termination using ODT pin
- Average Refresh Period 7.8 us at lower than $T_{\text {CASE }} 85 \times C, 3.9$ us at $85 \times C<T_{\text {CASE }} \leq 95 \times C$
- Asynchronous Reset
- Package : 94 balls FBGA - x4/x8 (with 16 support balls)

112 balls FBGA - x16 (with 16 support balls)

- All of Lead-free products are compliant for RoHS

The 1 Gb DDR3 SDRAM C-die is organized as a $32 \mathrm{Mbit} \times 4 / 16 \mathrm{Mbit} \times 8 /$ 8Mbit x 16 I/Os x 8banks device. This synchronous device achieves high speed double-data-rate transfer rates of up to $1333 \mathrm{Mb} / \mathrm{sec} / \mathrm{pin}$ (DDR31333) for general applications.

The chip is designed to comply with the following key DDR3 SDRAM features such as posted CAS, Programmable CWL, Internal (Self) Calibration, On Die Termination using ODT pin and Asynchronous Reset .
All of the control and address inputs are synchronized with a pair of externally supplied differential clocks. Inputs are latched at the crosspoint of differential clocks (CK rising and CK falling). All I/Os are synchronized with a pair of bidirectional strobes (DQS and $\overline{D Q S}$ ) in a source synchronous fashion. The address bus is used to convey row, column, and bank address information in a $\overline{R A S} / \overline{\mathrm{CAS}}$ multiplexing style. The DDR3 device operates with a single $1.5 \mathrm{~V} \pm 0.075 \mathrm{~V}$ power supply and $1.5 \mathrm{~V} \pm 0.075 \mathrm{~V}$ VDDQ.
The 1 Gb DDR3 device is available in 94 ball $\operatorname{FBGAs}(x 4 / x 8)$ and 112ball FBGA(x16)

Note : 1. The functionality described and the timing specifications included in this data sheet are for the DLL Enabled mode of operation.
2. 1066Mbps CL7 doesn't have back-ward compatibility with 800Mbps CL5

Note : This data sheet is an abstract of full DDR3 specification and does not cover the common features which are described in "DDR3 SDRAM Device Operation \& Timing Diagram".

### 4.0 Input/Output Functional Description

[ Table 3 ] Input/Output function description

| Symbol | Type | Function |
| :---: | :---: | :---: |
| CK, $\overline{\mathrm{CK}}$ | Input | Clock: CK and $\overline{\mathrm{CK}}$ are differential clock inputs. All address and control input signals are sampled on the crossing of the positive edge of CK and negative edge of $\overline{\mathrm{CK}}$. Output (read) data is referenced to the crossings of CK and $\overline{\mathrm{CK}}$ |
| CKE | Input | Clock Enable: CKE HIGH activates, and CKE Low deactivates, internal clock signals and device input buffers and output drivers. Taking CKE Low provides Precharge Power-Down and Self Refresh operation (all banks idle), or Active Power-Down (Row Active in any bank). CKE is asynchronous for self refresh exit. After VREFCA has become stable during the power on and initialization sequence, it must be maintained during all operations (including SelfRefresh). CKE must be maintained high throughout read and write accesses. Input buffers, excluding CK, $\overline{\mathrm{CK}}$, ODT and CKE are disabled during power-down. Input buffers, excluding CKE, are disabled during Self -Refresh. |
| $\overline{\mathrm{CS}}$ | Input | Chip Select: All commands are masked when $\overline{\mathrm{CS}}$ is registered HIGH. $\overline{\mathrm{CS}}$ provides for external Rank selection on systems with multiple Ranks. $\overline{\mathrm{CS}}$ is considered part of the command code. |
| ODT | Input | On Die Termination: ODT (registered HIGH) enables termination resistance internal to the DDR3 SDRAM. When enabled, ODT is only applied to each DQ, DQS, $\overline{D Q S}$ and DM/TDQS, NU/TDQS (When TDQS is enabled via Mode Register A11=1 in MR1) signal for $x 8$ configurations. The ODT pin will be ignored if the Mode Register (MR1) is programmed to disable ODT. |
| $\overline{\mathrm{RAS}}, \overline{\mathrm{CAS}}, \overline{\mathrm{WE}}$ | Input | Command Inputs: $\overline{\mathrm{RAS}}, \overline{\mathrm{CAS}}$ and $\overline{\mathrm{WE}}$ (along with $\overline{\mathrm{CS}}$ ) define the command being entered. |
| DM (DMU), (DML) | Input | Input Data Mask: DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH coincident with that input data during a Write access. DM is sampled on both edges of DQS. For x8 device, the function of DM or TDQS/TDQS is enabled by Mode Register A11 setting in MR1. |
| BA0-BA2 | Input | Bank Address Inputs: BAO - BA2 define to which bank an Active, Read, Write or Precharge command is being applied. Bank address also determines if the mode register or extended mode register is to be accessed during a MRS cycle. |
| A0-A12 | Input | Address Inputs: Provided the row address for Active commands and the column address for Read/Write commands to select one location out of the memory array in the respective bank. (A10/AP and $A 12 / \overline{B C}$ have additional functions, see below) <br> The address inputs also provide the op-code during Mode Register Set commands. |
| A10 / AP | Input | Autoprecharge: A10 is sampled during Read/Write commands to determine whether Autoprecharge should be performed to the accessed bank after the Read/Write operation. (HIGH:Autoprecharge; LOW: No Autoprecharge) A10 is sampled during a Precharge command to determine whether the Precharge applies to one bank (A10 LOW) or all banks (A10 HIGH). if only one bank is to be precharged, the bank is selected by bank addresses. |
| A12 / $\overline{\mathrm{BC}}$ | Input | Burst Chop:A12 is sampled during Read and Write commands to determine if burst chop(on-the-fly) will be performed. (HIGH : no burst chop, LOW : burst chopped). See command truth table for details |
| $\overline{\text { RESET }}$ | Input | Active Low Asynchronous Reset: Reset is active when $\overline{\text { RESET }}$ is LOW, and inactive when $\overline{\text { RESET }}$ is HIGH. <br>  $20 \%$ of VDD, i.e. 1.20 V for DC high and 0.30 V for DC low. |
| DQ | Input/Output | Data Input/ Output: Bi-directional data bus. |
| DQS, ( $\overline{\mathrm{DQS}}$ ) | Input/Output | Data Strobe: output with read data, input with write data. Edge-aligned with read data, centered in write data. |
| TDQS, (TDQS) | Output | Termination Data Strobe: TDQS/TDQS is applicable for X8 DRAMs only. When enabled via Mode Register A11=1 in MR1, DRAM will enable the same termination resistance function on TDQS/TDQS that is applied to DQS/DQS. When disabled via mode register A11=0 in MR1, DM/TDQS will provide the data mask function and TDQS is not used. |
| NC |  | No Connect: No internal electrical connection is present. |
| $V_{\text {DDQ }}$ | Supply | DQ Power Supply: $1.5 \mathrm{~V}+/-0.075 \mathrm{~V}$ |
| $\mathrm{V}_{\text {SSQ }}$ | Supply | DQ Ground |
| $V_{\text {DD }}$ | Supply | Power Supply: $1.5 \mathrm{~V}+/-0.075 \mathrm{~V}$ |
| $\mathrm{V}_{\text {SS }}$ | Supply | Ground |
| $\mathrm{V}_{\text {REFDQ }}$ | Supply | Reference voltage for DQ |
| $V_{\text {REFCA }}$ | Supply | Reference voltage for CA |
| ZQ | Supply | Reference Pin for ZQ calibration |
| Note : Input only pins (BA0-BA2, A0-A12, $\overline{\mathrm{RAS}}, \overline{\mathrm{CAS}}, \overline{\mathrm{WE}}, \overline{\mathrm{CS}}, \mathrm{CKE}$, ODT and $\overline{\mathrm{RESET}}$ ) do not supply termination. |  |  |

### 5.0 DDR3 SDRAM Addressing

| BC switch on the fly | $\mathrm{A}_{12} / \overline{\mathrm{BC}}$ | A12/BC | A12/BC |
| Page size | 2 KB | 2 KB | 2 KB |

Note 1: Page size is the number of bytes of data delivered from the array to the internal sense amplifiers when an ACTIVE command is registered.
Page size is per bank, calculated as follows:
page size $=2^{\text {COLBITS }} *$ ORG $^{3} 8$
where, COLBITS $=$ the number of column address bits, $\quad$ ORG $=$ the number of I/O (DQ) bits

### 6.0 Absolute Maximum Ratings

### 6.1 Absolute Maximum DC Ratings

| Symbol | Parameter | Rating | Units | Notes |
| :---: | :---: | :---: | :---: | :---: |
| VDD | Voltage on VDD pin relative to Vss | $-0.4 \mathrm{~V} \sim 1.975 \mathrm{~V}$ | V | 1,3 |
| VDDQ | Voltage on VDDQ pin relative to Vss | $-0.4 \mathrm{~V} \sim 1.975 \mathrm{~V}$ | V | 1,3 |
| $\mathrm{~V}_{\text {IN }}, \mathrm{V}_{\text {OUT }}$ | Voltage on any pin relative to Vss | $-0.4 \mathrm{~V} \sim 1.975 \mathrm{~V}$ | V | 1 |
| $\mathrm{~T}_{\text {STG }}$ | Storage Temperature | -55 to +100 | ${ }^{\circ} \mathrm{C}$ |  |

[ Table 4 ] Absolute Maximum DC Ratings
Note :

1. Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. Storage Temperature is the case surface temperature on the center/top side of the DRAM. For the measurement conditions, please refer to JESD51-2 standard.
3. VDD and VDDQ must be within 300 mV of each other at all times; and VREF must be not greater than $0.6 x \mathrm{VDDQ}$, When VDD and VDDQ are less than 500 mV ; VREF may be equal to or less than 300 mV .

### 6.2 DRAM Component Operating Temperature Range

| Symbol | Parameter | rating | Unit | Notes |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{T}_{\text {OPER }}$ | Normal Operating Temperature Range | 0 to 85 | ${ }^{\circ} \mathrm{C}$ | 1,2 |
|  | Extended Temperature Range (Optional) | 85 to 95 | ${ }^{\circ} \mathrm{C}$ | 1,3 |

[ Table 5] Temperature Range

## Note:

1. Operating Temperature $T_{\text {OPER }}$ is the case surface temperature on the center/top side of the DRAM. For measurement conditions, please refer to the JEDEC document JESD51-2.
2. The Normal Temperature Range specifies the temperatures where all DRAM specifications will be supported. During operation, the DRAM case temperature must be maintained between $0-85^{\circ} \mathrm{C}$ under all operating conditions
3. Some applications require operation of the Extended Temperature Range between $85^{\circ} \mathrm{C}$ and $95^{\circ} \mathrm{C}$ case temperature. Full specifications are guaranteed in this range, but the following additional conditions apply:
a) Refresh commands must be doubled in frequency, therefore reducing the Refresh interval tREFI to 3.9 us. It is also possible to specify a component with 1X refresh (tREFI to 7.8us) in the Extended Temperature Range. Please refer to supplier data sheet and/or the DIMM SPD for option availability.
b) If Self-Refresh operation is required in the Extended Temperature Range, then it is mandatory to either use the Manual Self-Refresh mode with Extended Temperature Range capability (MR2 A6 = Ob and MR2 A7 = 1b) or enable the optional Auto Self-Refresh mode (MR2 A6 = 1b and MR2 A7 = Ob). Please refer to the supplier data sheet and/or the DIMM SPD for Auto Self-Refresh option availability, Extended Temperature Range support and tREFI requirements in the Extended Temperature Range.

### 7.0 AC \& DC Operating Conditions

### 7.1 Recommended DC operating Conditions (SSTL_1.5)

| Symbol | Parameter | Rating |  |  | Units | Notes |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min. | Typ. | Max. |  |  |
| VDD | Supply Voltage | 1.425 | 1.5 | 1.575 | V | 1,2 |
| VDDQ | Supply Voltage for Output | 1.425 | 1.5 | 1.575 | V | 1,2 |

[ Table 6] Recommended DC Operating Conditions
Note :

1. Under all conditions VDDQ must be less than or equal to VDD.
2. VDDQ tracks with VDD. AC parameters are measured with VDD and VDDQ tied together.

### 8.0 AC \& DC Input Measurement Levels

### 8.1 AC and DC Logic input levels for single-ended signals

| Symbol | Parameter | DDR3-800/1066/1333 |  | Unit | Notes |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min. | Max. |  |  |
| $\mathrm{V}_{\mathrm{IH}}(\mathrm{DC})$ | dc input logic high | VREF + 100 | VDD | mV | 1 |
| $\mathrm{V}_{\text {IL }}(\mathrm{DC})$ | dc input logic low | VSS | VREF - 100 | mV | 1 |
| $\mathrm{V}_{\mathrm{IH}}(\mathrm{AC})$ | ac input logic high | VREF + 175 | - | mV | 1,2 |
| $\mathrm{V}_{\text {IL }}(\mathrm{AC})$ | ac input logic low | - | VREF - 175 | mV | 1,2 |
| VREFDQ(DC) | I/O Reference Voltage(DQ) | 0.49*VDDQ | 0.51*VDDQ | V | 3,4 |
| VREFCA(DC) | I/O Reference Voltage(CMD/ADD) | 0.49*VDDQ | 0.51*VDDQ | V | 3,4 |

[ Table 7] Single Ended AC and DC input levels

## Note:

1. For $D Q$ and $D M, V_{\text {REF }}=V_{\text {REFDQ }}$. For input only pins except RESET, or $V_{\text {REF }}=V_{\text {REFCA }}$
2. See 9.6 "Overshoot and Undershoot specifications" on page 23.
3. The ac peak noise on $V_{\text {REF }}$ may not allow $V_{R E F}$ to deviate from $V_{R E F(D C)}$ by more than $\pm 1 \%$ VDD (for reference : approx. $\pm 15 \mathrm{mV}$ )
4. For reference : approx. VDD/2 $\pm 15 \mathrm{mV}$

The dc-tolerance limits and ac-noise limits for the reference voltages VREFCA and VREFDQ are illustrate in Figure 1. It shows a valid reference voltage $\operatorname{VREF}(\mathrm{t})$ as a function of time. (VREF stands for VREFCA and VREFDQ likewise).
$\operatorname{VREF}(D C)$ is the linear average of $\operatorname{VREF}(\mathrm{t})$ over a very long period of time (e.g. 1 sec ). This average has to meet the min/max requiremts in above table. Furthermore $\operatorname{VREF}(\mathrm{t})$ may temporarily deviate from $\operatorname{VREF}(\mathrm{DC})$ by no more than $\pm 1 \% \operatorname{VDD}$.

Figure 1. Illustration of VREF(DC) tolerance and VREF ac-noise limits

The voltage levels for setup and hold time measurements $\mathrm{VIH}(\mathrm{AC}), \mathrm{VIH}(\mathrm{DC}), \mathrm{VIL}(\mathrm{AC})$ and $\mathrm{VIL}(\mathrm{DC})$ are dependent on VRef .
"VRef" shall be understood as VRef(DC), as defined in Figure 1.
This clarifies, that dc-variations of VRef affect the absolute voltage a signal has to reach to achieve a valid high or low level and therefore the time to which setup and hold is measured. System timing and voltage budgets need to account for VRef(DC) deviations from the optimum position within the data-eye of the input signals.

This also clarifies that the DRAM setup/hold specification and derating values need to include time and voltage associated with VRef ac-noise. Timing and voltage effects due to ac-noise on VRef up to the specified limit (+/-1\% of VDD) are included in DRAM timings and their associated deratings.

### 8.2 Differential swing requirement for differntial signals

Figure 2 : Definition of differntial ac-swing and "time above ac level tDVAC

[ Table 8 ] Differential swing requirement for clock (CK - $\overline{\mathrm{CK}}$ ) and strobe (DQS - $\overline{\mathrm{DQS}}$ )

| Symbol | Parameter | DDR3-800 \& 1066 \& 1033 \& 1600 |  | unit | Note |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | min | max |  |  |
| VIHdiff | differential input high | +0.2 | note 3 | V | 1 |
| VILdiff | differential input low | note 3 | -0.2 | V | 1 |
| VIHdiff(ac) | differential input high ac | $2 \times(\mathrm{VIH}(\mathrm{ac})-\mathrm{Vref})$ | note 3 | V | 2 |
| VIHdiff(ac) | differential input low ac | note 3 | $2 \times$ (Vref - VIL(ac)) | V | 2 |

Notes:

1. used to define a differential signal slew-rate.
2. for CK - $\overline{\mathrm{CK}}$ use VIH/VIL(ac) of ADD/CMD and VREFCA; for DQS - $\overline{\mathrm{DQS}}$, DQSL - $\overline{\mathrm{DQSL}}$, DQSU - $\overline{\mathrm{DQSU}}$ use VIH/VIL(ac) of DQs and VREFDQ; if a reduced ac-high or ac-low level is used for a signal group, then the reduced level applies also here.
3. these values are not defined, however they single-ended signals CK, $\overline{C K}, \mathrm{DQS}, \overline{\mathrm{DQS}}, \mathrm{DQSL}, \overline{\mathrm{DQSL}}, \mathrm{DQSU}, \overline{\mathrm{DQSU}}$ need to be within the respective limits $(\mathrm{VIH}(\mathrm{dc})$ max, $\mathrm{VIL}(\mathrm{dc}) \mathrm{min})$ for single-ended signals as well as the limitations for overshoot and undershoot.
[ Table 9 ] Allowed time before ringback (tDVAC) for CLK - $\overline{\text { CLK }}$ and DQS - $\overline{\text { DQS }}$.

| Slew Rate [V/ns] | tDVAC [ps] @ \|VIH/Ldiff(ac)| = 350mV |  | tDVAC [ps] @ \|VIH/Ldiff(ac)| $=300 \mathrm{mV}$ |  |
| :---: | :---: | :---: | :---: | :---: |
|  | min | max | min | max |
| $>4.0$ | 75 | - | 175 | - |
| 4.0 | 57 | - | 170 | - |
| 3.0 | 50 | - | 167 | - |
| 2.0 | 38 | - | 163 | - |
| 1.8 | 34 | - | 162 | - |
| 1.6 | 29 | - | 161 | - |
| 1.4 | 22 | - | 159 | - |
| 1.2 | 13 | - | 155 | - |
| 1.0 | 0 | - | 150 | - |
| < 1.0 | 0 | - | 150 | - |

### 8.2.1 Single-ended requirements for differential signals

Each individual component of a differential signal (CK, DQS, DQSL, DQSU, $\overline{\mathrm{CK}}, \overline{\mathrm{DQS}}, \overline{\mathrm{DQSL}}$, or $\overline{\mathrm{DQSU}}$ ) has also to comply with certain requirements for single-ended signals.
CK and $\overline{\mathrm{CK}}$ have to approximately reach VSEHmin / VSELmax (approximately equal to the ac-levels (VIH(ac) / VIL(ac) ) for ADD/CMD signals) in every half-cycle.
DQS, DQSL, DQSU, $\overline{D Q S}, \overline{\text { DQSL }}$ have to reach VSEHmin / VSELmax (approximately the ac-levels (VIH(ac) / VIL(ac) ) for DQ signals) in every half-cycle preceeding and following a valid transition.
Note that the applicable ac-levels for ADD/CMD and DQ's might be different per speed-bin etc. E.g. if VIH150(ac)/VIL150(ac) is used for ADD/CMD signals, then these ac-levels apply also for the single-ended signals CK and $\overline{\mathrm{CK}}$

Figure 3: Single-ended requirement for differential signals.
Note that while ADD/CMD and DQ signal requirements are with respect to Vref, the single-ended components of differential signals have a requirement with respect to VDD/2; this is nominally the same. The transition of single-ended signals through the ac-levels is used to measure setup time. For single-ended components of differential signals the requirement to reach VSELmax, VSEHmin has no bearing on timing, but adds a restriction on the common mode charateristics of these signals.

### 8.3 AC and DC logic input levels for Differential Signals

[ Table 10 ] Differential DC and AC input levels

| Symbol | Parameter | DDR3-800/1066/1333 |  | Unit | Notes |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min | Max |  |  |
| VIHdiff | Differential input logic high | +200 | - | mV | 1 |
| VILdiff | Differential input logic low | - | -200 |  |  |

Note :

1. Refer to "Overshoot and Undershoot specifications" on page 23.

### 8.4 Differential Input Cross Point Voltage

To guarantee tight setup and hold times as well as output skew parameters with respect to clock and strobe, each cross point voltage of differential input signals (CK, $\overline{\mathrm{CK}}$ and DQS, $\overline{\mathrm{DQS}}$ ) must meet the requirements in below table. The differential input cross point voltage VIX is measured from the actual cross point of true and complement signal to the midlevel between of VDD and VSS.

Figure 4. Vix Definition
[ Table 11 ] Cross point voltage for differential input signals (CK, DQS)

| Symbol | Parameter | DDR3-800/1066/1333/1600 |  | Unit |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Notes |  |  |
| VIX | Differential input Cross point voltage relative to VDD/2 | -150 | Max | 150 |

### 8.5 Slew rate definition for Single Ended Input Signals

8.5.1 Input Slew Rate for Input Setup Time (tIS) and Data Setup Time (tDS)

Setup (tIS and tDS) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of VRef and the first crossing of $\mathrm{VIH}(\mathrm{AC})$ min. Setup (tIS and tDS) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of VRef and the first crossing of VIL(AC)max.
8.5.2 Input Slew Rate for Input Hold Time (tIH) and Data Hold Time (tDH)

Hold nominal slew rate for a rising signal is defined as the slew rate between the last crossing of VIL(DC)max and the first crossing of VRef. Hold (tIH \&
$t D H$ ) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of VIH(DC)min and the first crossing of VRef

| Description | Measured |  | Defined by | Applicable for |
| :---: | :---: | :---: | :---: | :---: |
|  | From | To |  |  |
| Input slew rate for rising edge | Vref | $\operatorname{Vih}(\mathrm{AC}) \mathrm{min}$ | $\frac{\text { Vih(AC)min-Vref }}{\text { Delta TRS }}$ | Setup |
| Input slew rate for falling edge | Vref | $\operatorname{Vil}(\mathrm{AC}) \mathrm{max}$ | $\frac{\text { Vref-Vil(AC)max }}{\text { Delta TFS }}$ | (tIS,tDS) |
| Input slew rate for rising edge | Vil(DC)max | Vref | Vref-Vil(DC)max Delta TFH | Hold |
| Input slew rate for falling edge | $\operatorname{Vih}(\mathrm{DC}) \mathrm{min}$ | Vref | $\frac{\text { Vih(DC)min-Vref }}{\text { Delta TRH }}$ | (tlH,tDH) |

[ Table 12 ] Single Ended Input Slew Rate definition
Notes: This nominal slew rate applies for linear signal waveforms.

Figure 5. Input Nominal Slew Rate definition for Singel ended Signals

### 8.6 Slew rate definition for Differential Input Signals

| Description | Measured |  | Defined by |
| :---: | :---: | :---: | :---: |
|  | From | To |  |
| Differential input slew rate for rising edge (CK$\overline{\mathrm{CK}}$ and DQS- $\overline{\mathrm{DQS}}$ ) | VILdiffmax | VIHdiffmin | $\frac{\text { VIHdiffmin - VILdiffmax }}{\text { Delta TRdiff }}$ |
| Differential input slew rate for falling edge (CK$\overline{\mathrm{CK}}$ and DQS-DQS) | VIHdiffmin | VILdiffmax | $\frac{\text { VIHdiffmin - VILdiffmax }}{\text { Delta TFdiff }}$ |

[ Table 13 ] Differential input slew rate definition
Note : The differential signal (i.e. CK $-\overline{\mathrm{CK}}$ and DQS $-\overline{\mathrm{DQS}}$ ) must be linear between these thresholds

Figure 6. Differential Input Slew Rate definition for DQS, $\overline{\mathrm{DQS}}$ and $\mathrm{CK}, \overline{\mathrm{CK}}$

### 9.0 AC and DC Output Measurement Levels

### 9.1 Single Ended AC and DC Output Levels

[ Table 14 ] Single Ended AC and DC output levels

| Symbol | Parameter | DDR3-800/1066/1333/1600 | Units |
| :---: | :--- | :---: | :---: |
| $\mathrm{V}_{\mathrm{OH}(\mathrm{DC})}$ | NC output high measurement level (for IV curve linearity) | $0.8 \times \mathrm{VDDQ}$ | V |
| $\mathrm{V}_{\mathrm{OM}(\mathrm{DC})}$ | DC output mid measurement level (for IV curve linearity) | $0.5 \times \mathrm{VDDQ}$ | V |
| $\mathrm{V}_{\mathrm{OL}(\mathrm{DC})}$ | DC output low measurement level (for IV curve linearity) | $0.2 \times \mathrm{VDDQ}$ | V |
| $\mathrm{V}_{\mathrm{OH}(\mathrm{AC})}$ | AC output high measurement level (for output SR) | $\mathrm{VTT}+0.1 \times \mathrm{VDDQ}$ | V |
| $\mathrm{V}_{\mathrm{OL}(\mathrm{AC})}$ | AC output low measurement level (for output SR$)$ | 1 |  |

Note :

1. The swing of $+/-0.1 \times V D D Q$ is based on approximately $50 \%$ of the static single ended output high or low swing with a driver impedance of 34 ohms and an effective test load of 250 hms to $\mathrm{VTT}=\mathrm{VDDQ} / 2$.

### 9.2 Differential AC and DC Output Levels

| Symbol | Parameter | DDR3-800/1066/1333/1600 | Units |
| :---: | :--- | :---: | :---: |
| $\mathrm{V}_{\text {OHdiff(AC) }}$ | AC differential output high measurement level (for output SR) | V | 1 |
| $\mathrm{~V}_{\text {OLdiff(DC) }}$ | AC differential output low measurement level (for output SR) | $+0.2 \times \mathrm{VDDQ}$ | V |

[ Table 15 ] Differential AC and DC output levels

## Note :

1. The swing of $+/-0.2 \times V D D Q$ is based on approximately $50 \%$ of the static singel ended output high or low swing with a driver impedance of 34 ohms and an effective test load of 25 ohms to $\mathrm{VTT}=\mathrm{VDDQ} / 2$ at each of the differential outputs

### 9.3.Single Ended Output Slew Rate

With the reference load for timing measurements, output slew rate for falling and rising edges is defined and measured between $\mathrm{VOL}(\mathrm{AC})$ and $\mathrm{VOH}(\mathrm{AC})$ for single ended signals as shown in Table 16 and figure 7.
[ Table 16 ] Single Ended Output slew rate definition

| Description |  |  | Measured |  |  | Defined by |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | From | To |  |  |  |  |  |  |
| Single ended output slew rate for rising edge |  |  | VOL(AC) | $\mathrm{VOH}(\mathrm{AC})$ |  | $\frac{\mathrm{VOH}(\mathrm{AC})-\mathrm{VOL}(\mathrm{AC})}{\text { Delta TRse }}$ |  |  |  |  |
| Single ended output slew rate for falling edge |  |  | $\mathrm{VOH}(\mathrm{AC})$ | VOL(AC) |  | $\frac{\mathrm{VOH}(\mathrm{AC})-\mathrm{VOL}(\mathrm{AC})}{\text { Delta TFse }}$ |  |  |  |  |
| Parameter | Symbol | DDR3-800 |  | DDR3-1066 |  | DDR3-1333 |  | DDR3-1600 |  | Units |
|  |  | Min | Max | Min | Max | Min | Max | Min | Max |  |
| Single ended output slew rate | SRQse | 2.5 | 5 | 2.5 | 5 | 2.5 | 5 | TBD | 5 | V/ns |

[ Table 17 ] Single Ended Output slew rate
Note : Output slew rate is verified by design and characterization, and may not be subject to production test.
For Ron=RZQ/7 setting

Figure 7. Single Ended Output Slew Rate definition

### 9.4 Differential Output Slew Rate

With the reference load for timing measurements, output slew rate for falling and rising edges is defined and measured between VOLdiff(AC) and VOHdiff(AC) for differential signals as shown inTable 18 and figure 8.
[ Table 18 ] Differential Output slew rate definition

| Description |  | Measured |  |  |  | Defined by |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | From |  | To |  |  |  |  |  |  |
| Differential output slew rate for rising edge |  | VOLdiff(AC) |  | VOHdiff(AC) |  | $\frac{\text { VOHdiff(AC)-VOLdiff(AC) }}{\text { Delta TRdiff }}$ |  |  |  |  |
| Differential output slew rate for falling edge |  | VOHdiff(AC) |  | VOLdiff(AC) |  | $\frac{\text { VOHdiff(AC)-VOLdiff(AC) }}{\text { Delta TFdiff }}$ |  |  |  |  |
| Parameter | Symbol | DDR3-800 |  | DDR3-1066 |  | DDR3-1333 |  | DDR3-1600 |  | Units |
|  |  | Min | Max | Min | Max | Min | Max | Min | Max |  |
| Single ended output slew rate | SRQse | 5 | 10 | 5 | 10 | 5 | 10 | TBD | 10 | V/ns |

## [ Table 19 ] Differential Output slew rate

Note : Output slew rate is verified by design and characterization, and may not be subject to production test.
For Ron=RZQ/7 setting

Figure 8. Differential Output Slew Rate definition

### 9.5 Reference Load for AC Timing and Output Slew Rate

Figure 9 represents the effective reference load of 25 ohms used in defining the relevant AC timing parameters of the device as well as output slew rate measurements.

It is not intended as a precise representation of any particular system environment of a depiction of the actual load presented by a production tester. System designers should use IBIS or other simulation tools to correlate the timing reference load to a system environment. Manufacturers correlate to their production test conditions, generally one or more coaxial transmission lines terminated at the tester electronics.

Figure 9. Reference Load for AC Timing and Output Slew Rate

### 9.6 Overshoot/Undershoot Specification

### 9.6.1 Address and Control Overshoot and Undershoot specifications

AC Overshoot/Undershoot Specification for Address and Control Pins
(A0-A12, BAO-BA2, $\overline{C S}, \overline{R A S}, \overline{C A S}, \overline{W E}, C K E, O D T)$

| Parameter | Specification |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | DDR3-800 | DDR3-1066 | DDR3-1333 | DDR3-1600 |
| Maximum peak amplitude allowed for overshoot area (See Figure 8) | 0.4 V | 0.4 V | 0.4 V | 0.4 V |
| Maximum peak amplitude allowed for undershoot area (See Figure 8) | 0.4 V | 0.4 V | 0.4 V | 0.4 V |
| Maximum overshoot area above VDD (See Figure 8) | $0.67 \mathrm{~V}-\mathrm{ns}$ | $0.5 \mathrm{~V}-\mathrm{ns}$ | $0.4 \mathrm{~V}-\mathrm{ns}$ | $0.33 \mathrm{~V}-\mathrm{ns}$ |
| Maximum undershoot area below VSS (See Figure 8) | $0.67 \mathrm{~V}-\mathrm{ns}$ | $0.5 \mathrm{~V}-\mathrm{ns}$ | $0.4 \mathrm{~V}-\mathrm{ns}$ | $0.33 \mathrm{~V}-\mathrm{ns}$ |

[ Table 20 ] AC overshoot/undershoot specification for Address and Control pins

Figure 10. Address and Control Overshoot and Undershoot definition
9.6.2 Clock, Data, Strobe and Mask Overshoot and Undershoot specifications

AC Overshoot/Undershoot Specification for Clock, Data, Strobe, and Mask Pins
(DQ, DQS, $\overline{\mathrm{DQS}}, \mathrm{DM}, \mathrm{CK}, \overline{\mathrm{CK}})$

| Parameter | Specification |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | DDR3-800 | DDR3-1066 | DDR3-1333 | DDR3-1600 |
| Maximum peak amplitude allowed for overshoot area (See Figure 9) | 0.4 V | 0.4 V | 0.4 V | 0.4 V |
| Maximum peak amplitude allowed for undershoot area (See Figure 9) | 0.4 V | 0.4 V | 0.4 V | 0.4 V |
| Maximum overshoot area above VDDQ (See Figure 9) | $0.25 \mathrm{~V}-\mathrm{ns}$ | $0.19 \mathrm{~V}-\mathrm{ns}$ | $0.15 \mathrm{~V}-\mathrm{ns}$ | $0.13 \mathrm{~V}-\mathrm{ns}$ |
| Maximum undershoot area below VSSQ (See Figure 9) | $0.25 \mathrm{~V}-\mathrm{ns}$ | $0.19 \mathrm{~V}-\mathrm{ns}$ | $0.15 \mathrm{~V}-\mathrm{ns}$ | $0.13 \mathrm{~V}-\mathrm{ns}$ |

[ Table 21 ] AC overshoot/undershoot specification for Clock, Data, Strobe and Mask

Figure 11. Clock, Data, Strobe and Mask Overshoot and Undershoot definition

### 9.734 ohm Output Driver DC Electrical Characteristics

A functional representation of the output buffer is shown below. Output driver impedance RON is defined by the value of external reference resistor RZQ as follows:
$\mathrm{RON}_{34}=$ RZQ/7 (Nominal 34ohms +/- 10\% with nominal RZQ=240ohm)

The individual Pull-up and Pull-down resistors (RONpu and RONpd) are defined as follows
RONpu =
 under the condition that RONpd is turned off I lout I

RONpd = $\qquad$ under the condition that RONpu is turned off

## Output Driver : Definition of Voltages and Currents

Figure 12. Output Driver : Definition of Voltages and Currents
[ Table 22 ] Output Driver DC Electrical Characteristics, assuming RZQ=240 ohms;
entire operating temperature range; after proper ZQ calibration

| RONnom | Resistor | Vout | Min | Nom | Max | Units | Notes |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 34Ohms | RON34pd | VOLdc $=0.2 \times \mathrm{VDDQ}$ | 0.6 | 1.0 | 1.1 | RZQ/7 | 1,2,3 |
|  |  | VOMdc $=0.5 \times \mathrm{VDDQ}$ | 0.9 | 1.0 | 1.1 | RZQ/7 | 1,2,3 |
|  |  | $\mathrm{VOHdc}=0.8 \times \mathrm{VDDQ}$ | 0.9 | 1.0 | 1.4 | RZQ/7 | 1,2,3 |
|  | RON34pu | VOLdc $=0.2 \times \mathrm{VDDQ}$ | 0.9 | 1.0 | 1.4 | RZQ/7 | 1,2,3 |
|  |  | VOMdc $=0.5 \times \mathrm{VDDQ}$ | 0.9 | 1.0 | 1.1 | RZQ/7 | 1,2,3 |
|  |  | VOHdc $=0.8 \times \mathrm{VDDQ}$ | 0.6 | 1.0 | 1.1 | RZQ/7 | 1,2,3 |
| Mismatch between Pull-up and Pull-down, MMpupd |  | VOMdc $=0.5 \times \mathrm{VDDQ}$ | -10 |  | 10 | \% | 1,2,4 |

Note :

1. The tolerance limits are specified after calibration with stable voltage and temperature. For the behavior of the tolerance limits if temperature or voltage changes after calibration, see following section on voltage and temperature sensitivity
2. The tolerance limits are specified under the condition that VDDQ = VDD and that VSSQ = VSS
3. Pull-down and pull-up output driver impedance are recommended to be calibrated at $0.5 \times$ VDDQ. Other calibration schemes may be used to achieve the linearity spec shown above, e.g. calibration at $0.2 \times$ VDDQ and $0.8 \times$ VDDQ
4. Measurement definition for mismatch between pull-up and pull-down, MMpupd: Measure RONpu and RONpd. both at $0.5 \times$ VDDQ:

$$
\frac{\text { RONpu - RONpd }}{\text { RONnom }} \times 100
$$

### 9.7.1 Output Drive Temperature and Voltage sensitivity

If temperature and/or voltage change after calibration, the tolerance limits widen according to table below $\Delta \mathrm{T}=\mathrm{T}-\mathrm{T}$ (@calibration); $\quad \Delta \mathrm{V}=\mathrm{VDDQ}-\mathrm{VDDQ}$ (@calibration); VDD = VDDQ
${ }^{*} d R_{O N} d T$ and $d R_{O N} d V$ are not subject to production test but are verified by design and characterization
[ Table 23] Output Driver Sensitivity Definition

|  | Min | Max | Units |
| :---: | :---: | :---: | :---: |

### 9.8 On-Die Termination (ODT) Levels and I-V Characteristics

On-Die Termination effective resistance RTT is defined by bits A9, A6 and A2 of MR1 register.
ODT is applied to the DQ,DQ, DQS/DQS and TDQS, $\overline{T D Q S}$ ( $x 8$ devices only) pins.
A functional representation of the on-die termination is shown below. The individual pull-up and pull-down resistors (RTTpu and RTTpd) are defined as follows :

RTTpu $=\quad$| VDDQ-Vout |
| :--- |
| I lout $I$ |$\quad$ under the condition that RTTpd is turned off

RTTpd $=\quad$ Vout lout $\quad$ under the condition that RTTpu is turned off

On-Die Termination : Definition of Voltages and Currents

Figure 13. On-Die Termination : Definitionof Voltages and Currents

### 9.8.1 ODT DC electrical characteristics

Table \# provides and overview of the ODT DC electrical characteristics. They values for $\mathrm{RTT}_{60 \text { pd120, }}, \mathrm{RTT}_{60 \text { pu120, }}, \mathrm{RTT}_{120 \mathrm{pd} 240,}, \mathrm{RTT}_{120 \mathrm{pu} 240,}, \mathrm{RTT}_{40 \text { pd80, }}$, $\mathrm{RTT}_{40 \text { pu80, }}, \mathrm{RTT}_{30 \text { pd60, }}, \mathrm{RTT}_{30 \text { pu60, }} \mathrm{RTT}_{20 \mathrm{pd} 40,} \mathrm{RTT}_{20 \text { pu40 }}$ are not specification requirements, but can be used as design guide lines:.

| MR1 (A9,A6,A2) | RTT | RESISTOR | Vout | MIN | NOM | MAX | UNIT | NOTES |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $(0,1,0)$ | 120 ohm | $\mathrm{RTT}_{120 \mathrm{pd} 240}$ | 0.2XVDDQ | 0.6 | 1.0 | 1.1 | $\mathrm{R}_{\mathrm{ZQ}}$ | 1,2,3,4 |
|  |  |  | 0.5XVDDQ | 0.9 | 1.0 | 1.1 | $\mathrm{R}_{\mathrm{ZQ}}$ | 1,2,3,4 |
|  |  |  | 0.8XVDDQ | 0.9 | 1.0 | 1.4 | $\mathrm{R}_{\mathrm{ZQ}}$ | 1,2,3,4 |

| Deviation of VM w.r.t VDDQ/2, 4 VM |  |  |  | -5 |  | 5 | \% | 1,2,5,6 |

[ Table 25 ] ODT DC Electrical characteristics, assuming $R Z Q=240$ ohm $+/-1 \%$ entire operating temperature range; after proper $Z Q$ calibration

## Note :

1. The tolerance limits are specified after calibration with stable voltage and temperature. For the behavior of the tolerance limits if temperature or voltage changes after calibration, see following section on voltage and temperature sensitivity
2. The tolerance limits are specified under the condition that VDDQ $=$ VDD and that VSSQ $=$ VSS
3. Pull-down and pull-up ODT resistors are recommended to be calibrated at 0.5 XVDDQ. Other calibration schemes may be used to achieve the linearity spec shown above, e.g. calibration at 0.2XVDDQ and 0.8XVDDQ.
4. Not a specification requirement, but a design guide line
5. Measurement definition for RTT:

Apply $\mathrm{VIH}(\mathrm{ac})$ to pin under test and measure current $\mathrm{I}(\mathrm{VIH}(\mathrm{ac}))$, then apply $\mathrm{VIL}(\mathrm{ac})$ to pin under test and measure current $\mathrm{I}(\mathrm{VIL}(\mathrm{ac}))$ perspectively

$$
\mathrm{RTT}=\frac{\mathrm{VIH}(\mathrm{ac})-\mathrm{VIL}(\mathrm{ac})}{\mathrm{I}(\mathrm{VIH}(\mathrm{ac}))-\mathrm{I}(\mathrm{VIL}(\mathrm{ac}))}
$$

6. Measurement definition for VM and $\Delta \mathrm{VM}$ : Measure voltage (VM) at test pin (midpoint) with no load

$$
\Delta \mathrm{VM}=\left(\begin{array}{ll}
\frac{2 \times \mathrm{VM}}{\mathrm{VDDQ}} & -1
\end{array}\right) \times 100
$$

### 9.8.2 ODT Temperature and Voltage sensitivity

If temperature and/or voltage change after calibration, the tolerance limits widen according to table below
$\Delta \mathrm{T}=\mathrm{T}-\mathrm{T}(@$ calibration); $\quad \Delta \mathrm{V}=\mathrm{VDDQ}-\mathrm{VDDQ}$ (@calibration); VDD = VDDQ

## [ Table 26 ] ODT Sensitivity Definition

|  | Min | Max | Units |
| :---: | :---: | :---: | :---: |
| $R T T$ | $0.9-d R_{T T} d T{ }^{*}\|\Delta T\|-d R_{T T} d V{ }^{*}\|\Delta V\|$ | $1.6+d R_{T T} d T{ }^{*}\|\Delta T\|+d R_{T T} d V{ }^{*}\|\Delta V\|$ | $R Z Q / 2,4,6,8,12$ |

[ Table 27 ] ODT Voltage and Temperature Sensitivity

|  | Min | Max | Units |
| :---: | :---: | :---: | :---: |
| $d R_{T T} d T$ | 0 | 1.5 | $\% /{ }^{\circ} \mathrm{C}$ |
| $d R_{T T} d V$ | 0 | 0.15 | $\% / \mathrm{mV}$ |

[^2]
### 9.9 ODT Timing Definitions

### 9.9.1 Test Load for ODT Timings

Different than for timing measurements, the reference load for ODT timings is defined in Figure 14

BD_REFLOAD_ODT

Figure 14. ODT Timing Reference Load

### 9.9.2 ODT Timing Definition

Definitions for $t_{\text {AON }}, t_{\text {AONPD }}, t_{\text {AOF }}, t_{\text {AOFPD }}$ and $t_{\text {ADC }}$ are provided in Table28 and subsequent figures. Measurement reference settings are provided in Table29.
[ Table 28 ] ODT Timing Definitions

| Symbol | Begin Point Definition | End Point Definition | Figute |
| :--- | :--- | :--- | :--- |
| $t_{\text {AON }}$ | Rising edge of CK $-\overline{\mathrm{CK}}$ defined by the end point of ODTLon | Extrapolated point at VSSQ | Figure 2 |
| $t_{\text {AONPD }}$ | Rising edge of CK $-\overline{\mathrm{CK}}$ with ODT being first registered high | Extrapolated point at VSSQ | Figure 3 |
| $t_{\text {AOF }}$ | Rising edge of CK $-\overline{\mathrm{CK}}$ defined by the end point of ODTLoff | End point: Extrapolated point at VRTT_Nom |  |
| $t_{\text {AOFPD }}$ | Rising edge of CK $-\overline{\mathrm{CK}}$ with ODT being first registered low | End point: Extrapolated point at VRTT_Nom | Figure 5 |
| $t_{\text {ADC }}$ | Rising edge of CK $-\overline{\mathrm{CK}}$ defined by the end point of ODTLcnw, <br> ODTLcwn4 of ODTLcwn8 | End point: Extrapolated point at VRTT_Wr and <br> VRTT_Nom respectively | Figure 6 |

### 10.0 Idd Specification Parameters and Test Conditions

### 10.1 IDD Measurement Conditions

Within the tables provided further down, an overview about the IDD measurement conditions is provided as follows:
[ Table 30 ] Overview of Tables providing IDD Measurement Conditions and DRAM Behavior

| Table number | Measurement Conditions |
| :--- | :--- |
| Table 34 | IDD0 and IDD1 |
| Table 35 | IDD2N, IDD2Q, IDD2P(0), IDD2P(1) |
| Table 36 | IDD3N and IDD3P |
| Table 37 | IDD4R, IDD4W, IDD7 |
| Table 38 | IDD7 for different speed grades and different tRRD, tFAW conditions |
| Table 39 | IDD5B |
| Table 40 | IDD6, IDD6ET |

Within the tables about IDD measurement conditions, the following definitions are used:

- LOW is defined as $\mathrm{V}_{\text {IN }}<=\mathrm{V}_{\text {ILAC }}$ (max.); HIGH is defined as $\mathrm{V}_{\text {IN }}>=\mathrm{V}_{\text {IHAC }}$ (min.);
- STABLE is defined as inputs are stable at a HIGH or LOW level
- FLOATING is defined as inputs are $\mathrm{V}_{\text {REF }}=\mathrm{V}_{\mathrm{DDQ}} / 2$
- SWITCHING is defined as described in the following 2 tables.
[ Table 31 ] Definition of SWITCHING for Address and Command Input Signals
SWITCHING for Address (row, column) and Command Signals ( $\overline{\mathrm{CS}}, \overline{\mathrm{RAS}}, \overline{\mathrm{CAS}}, \overline{\mathrm{WE}}$ ) is defined as:

| Address <br> (Row, Column): | If not otherwise mentioned the inputs are stable at HIGH or LOW during 4 clocks and change then to the opposite value <br> (e.g. $A x A x A x A x \overline{A x} \overline{A x} \overline{A x} \overline{A x} A x A x A x A x \ldots .$. <br> please see each IDDx definition for details |
| :---: | :---: |
| Bank address: | If not otherwise mentioned the bank addresses should be switched like the row/ column addresses - please see each IDDx definition for details |
| Command <br> ( $\overline{\mathrm{CS}}, \overline{\mathrm{RAS}}, \overline{\mathrm{CAS}}, \overline{\mathrm{WE}}):$ | Define $\mathrm{D}=\{\overline{\mathrm{CS}}, \overline{\mathrm{RAS}}, \overline{\mathrm{CAS}}, \overline{\mathrm{WE}}\}:=\{\mathrm{HIGH}$, LOW, LOW, LOW $\}$ <br> Define $\bar{D}=\{\overline{\mathrm{CS}}, \overline{\mathrm{RAS}}, \overline{\mathrm{CAS}}, \overline{\mathrm{WE}}\}:=\{\mathrm{HIGH}, \mathrm{HIGH}, \mathrm{HIGH}, \mathrm{HIGH}\}$ <br> Define Command Background Pattern = D D $\overline{\mathrm{D}} \overline{\mathrm{D}} \mathrm{D} D \overline{\mathrm{D}} \overline{\mathrm{D}} \mathrm{D} D \overline{\mathrm{D}} \overline{\mathrm{D}} \ldots$ <br> If other commands are necessary (e.g. ACT for IDD0 or Read for IDD4R) the Background Pattern Command is substituted by the respective $\overline{\mathrm{CS}}, \overline{\mathrm{RAS}}, \overline{\mathrm{CAS}}, \overline{\mathrm{WE}}$ levels of the necessary command. <br> See each IDDx definition for details and figures 1,2,3 as examples. |

[ Table 32 ] Definition of SWITCHING for Data (DQ)

| SWITCHING for Data (DQ) is defined as |  |
| :--- | :--- |
| Data <br> (DQ) | Data DQ is changing between HIGH and LOW every other data transfer (once per clock) for DQ signals, which means <br> that data DQ is stable during one clock; see each IDDx definition for exceptions from this rule and for further details. <br> See figures 1,2,3 as examples. |
| Data Masking (DM) | NO Switching; DM must be driven LOW all the time |

## Timing parameters are listed in the following table:

[ Table 33 ] For IDD testing the following parameters are utilized.

| Parameter Bin |  | DDR3-800 | DDR3-1066 |  | DDR3-1333 |  | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 6-6-6 | 7-7-7 | 8-8-8 | 8-8-8 | 9-9-9 |  |
| $\mathrm{t}_{\text {CKmin }}$ (IDD) |  | 2.5 | 1.875 |  | 1.5 |  | ns |
| CL(IDD) |  | 6 | 7 | 8 | 8 | 9 |  |
| $\mathrm{t}_{\text {RCDmin }}($ IDD $)$ |  | 15 | 13.13 | 15 | 12 | 13.5 | ns |
| $t_{\text {RCmin }}$ (IDD) |  | 52.5 | 50.63 | 52.50 | 48 | 49.5 | ns |
| $\mathrm{t}_{\text {RASmin }}($ IDD $)$ |  | 37.5 | 37.5 | 37.5 | 36 | 36 | ns |
| $\mathrm{t}_{\text {RPmin }}$ (IDD) |  | 15 | 13.13 | 15 | 12 | 13.5 | ns |
| $\mathrm{t}_{\text {FAW }}$ (IDD) | x4/x8 | 40 | 37.5 | 37.5 | 30 | 30 | ns |
|  | x16 | 50 | 50 | 50 | 45 | 45 | ns |
| $\mathrm{t}_{\text {RRD }}($ IDD $)$ | x4/x8 | 10 | 7.5 | 7.5 | 6.0 | 6.0 | ns |
|  | x16 | 10 | 10 | 10 | 7.5 | 7.5 | ns |
| $\mathrm{t}_{\text {RFC }}($ IDD $)-1 \mathrm{~Gb}$ |  | 110 | 110 | 110 | 110 | 110 | 110 |

The following conditions apply:

1. IDD specifications are tested after the device is properly initialized.
2. Input slew rate is specified by AC Parametric test conditions.
3. IDD parameters are specified with ODT and output buffer disabled (MR1 Bit A12).
[ Table 34 ] IDD Measurement Conditions for IDD0 and IDD1

| Current | IDD0 | IDD1 |
| :---: | :---: | :---: |

| Precharge Power <br> Down Mode / Mode Register Bit ${ }^{\text {a }}$ | n.a. | Fast Exit / 1 (any valid command after $\mathrm{tXP}{ }^{1}$ ) | Slow Exit / 0 <br> Slow exit (RD and ODT commands must satisfy tXPDLL-AL) | n.a. |

## Note :

1. In DDR3 the MRS Bit 12 defines DLL on/off behavior ONLY for precharge power down. There are 2 different Precharge Power Down states possible : one with DLL on (fast exit, bit $12=1$ ) and one with DLL off (slow exit, bit $12=0$ ).
2. Because it is an exit after precharge power down the valid commands are: Activate, Refresh, Mode-Register Set, Enter - Self Refresh.

Figure 21. IDD2N /IDD3N Example (DDR3-800-666, 1Gb X8)
[ Table36 ] IDD Measurement Conditions for IDD3N and IDD3P(fast exit)

| Current | IDD3N | IDD3P |
| :---: | :---: | :---: |
| Name | Active Standby Current | Active Power-Down Current ${ }^{\text {a }}$ Always Fast Exit |
| Measurement Condition |  |  |
| Timing Diagram Example | Figure 2 |  |

[ Table 43 ] IDD Specification for 1Gb DDR3 C-die

### 11.0 Input/Output Capacitance

| Parameter | Symbol | DDR3-800 |  | DDR3-1066 |  | DDR3-1333 |  | DDR3-1600 |  | Units | Notes |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min | Max | Min | Max | Min | Max | Min | Max |  |  |
| Input/output capacitance (DQ, DM, DQS, $\overline{\text { DQS }}$, TDQS, $\overline{\text { TDQS }})$ | ClO | 1.5 | 3.0 | 1.5 | 3.0 | 1.5 | 2.5 | TBD | TBD | pF | 1,2,3 |
| Input capacitance (CK and $\overline{\mathrm{CK}}$ ) | CCK | 0.8 | 1.6 | 0.8 | 1.6 | 0.8 | 1.4 | 0.8 | 1.4 | pF | 2,3,5 |
| Input capacitance delta (CK and $\overline{\mathrm{CK}}$ ) | CDCK | 0 | 0.15 | 0 | 0.15 | 0 | 0.15 | 0 | 0.15 | pF | 2,3,4 |
| Input capacitance <br> (All other input-only pins) | Cl | 0.75 | 1.5 | 0.75 | 1.5 | 0.75 | 1.3 | 0.75 | 1.3 | pF | 2,3,6 |
| Input capacitance delta (DQS and DQS) | CDDQS | 0 | 0.2 | 0 | 0.2 | 0 | 0.15 | 0 | 0.15 | pF | 2,3,12 |
| Input capacitance delta (All control input-only pins) | CDI_CTRL | -0.5 | 0.3 | -0.5 | 0.3 | -0.4 | 0.2 | -0.4 | 0.2 | pF | 2,3,7,8 |
| Input capacitance delta (all ADD and CMD input-onlypins) | CDI_ADD_CMD | -0.5 | 0.5 | -0.5 | 0.5 | -0.4 | 0.4 | -0.4 | 0.4 | pF | 2,3,9,10 |
| Input/output capacitance delta (DQ, DM, DQS, $\overline{\mathrm{DQS}}$, TDQS, $\overline{\text { TDQS }}$ ) | CDIO | -0.5 | 0.3 | -0.5 | 0.3 | -0.5 | 0.3 | -0.5 | 0.3 | pF | 2,3,11 |
| Input/output capacitance of ZQ pin | CZQ | - | 3 | - | 3 | - | 3 | - | 3 | pF | 2, 3, 13 |

[ Table 44 ] Input / Output Capacitance

Note :

1. Although the DM, TDQS and TDQS\# pins have different functions, the loading matches DQ and DQS
2. This parameter is not subject to production test. It is verified by design and characterization.

The capacitance is measured according to JEP147("PROCEDURE FOR MEASURING INPUT CAPACITANCE USING A VECTOR NETWORK
ANALYZER( VNA)") with VDD, VDDQ, VSS, VSSQ applied and all other pins floating (except the pin under test, CKE, RESET\# and ODT as necessary). VDD=VDDQ=1.5V, VBIAS=VDD/2 and on-die termination off.
3. This parameter applies to monolithic devices only; stacked/dual-die devices are not covered here
4. Absolute value of CCK-CCK\#
5. Absolute value of $\mathrm{CIO}(\mathrm{DQS})-\mathrm{CIO}(\mathrm{DQS} \#)$
6. CI applies to ODT, CS\#, CKE, A0-A15, BA0-BA2, RAS\#, CAS\#, WE\#.
7. CDI_CTRL applies to ODT, CS\# and CKE
8. CDI_CTRL=CI(CTRL) $-0.5^{*}(\mathrm{Cl}(\mathrm{CLK})+\mathrm{Cl}(\mathrm{CLK} \#))$
9. CDI_ADD_CMD applies to A0-A15, BA0-BA2, RAS\#, CAS\# and WE\#
10. CDI_ADD_CMD $=\mathrm{Cl}\left(\mathrm{ADD} \_C M D\right)-0.5^{*}(\mathrm{Cl}(\mathrm{CLK})+\mathrm{Cl}(\mathrm{CLK} \#))$
11. $\mathrm{CDIO}=\mathrm{CIO}(\mathrm{DQ}, \mathrm{DM})-0.5^{*}(\mathrm{CIO}(\mathrm{DQS})+\mathrm{CIO}(\mathrm{DQS}))$

### 12.0 Electrical Characteristics and AC timing for DDR3-800 to DDR3-1600

[ Table 45] Clock specification
Add note fot tCK(avg)
tCK(avg) is calculated as the average clock period across any consecutive 200 cycle window, where each clock period is calculated from rising edge to rising edge.

$$
\sum\left(\begin{array}{ll}
N & \\
& \text { tCKj }
\end{array}\right) / \mathrm{N} \quad \mathrm{~N}=200
$$

Add note fot tCK(abs)
tCK(abs) is the absolute clock period, as measured from one rising edge to the next consecutive rising edge.

### 12.2 Clock Jitter Specification

| Parameter | Symbol | DDR3-800 |  | DDR3-1066 |  | DDR3-1333 |  | DDR3-1600 |  | Units |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | min | max | min | max | min | max | min | max |  |
| Clock period jitter | tJIT(per) | -100 | 100 | -90 | 90 | -80 | 80 | -70 | 70 | ps |
| Clock period jitter during DLL locking period | tJIT(per,lck) | -90 | 90 | -80 | 80 | -70 | 70 | -60 | 60 | ps |
| Cycle to cycle clock period jitter | tJIT(cc) | 200 |  | 180 |  | 160 |  | 140 |  | ps |
| Cycle to cycle clock period jitter during DLL locking period | tJIT(cc,lck) | 180 |  | 160 |  | 140 |  | 120 |  | ps |
| Cumulative error across n cycles | tERR(nper) | TBD | TBD | TBD | TBD | TBD | TBD | TBD | TBD | ps |
| Average high pulse width | tCH(avg) | 0.47 | 0.53 | 0.47 | 0.53 | 0.47 | 0.53 | 0.47 | 0.53 | tCK(avg) |
| Average low pulse width | tCL(avg) | 0.47 | 0.53 | 0.47 | 0.53 | 0.47 | 0.53 | 0.47 | 0.53 | tCK(avg) |
| Duty cycle jitter | tJIT(duty) | -100 | 100 | -75 | 75 | -60 | 60 | -50 | 50 | ps |

[ Table 46 ] Clock Jitter specification

Note : The jitter specified is a random jitter meeting a Gaussian distribution. Input clocks violating the min/max values may result in malfunction of the DDR3 SDRAM device.

## Add note for tCH(avg) and tCL(avg)

$\mathrm{tCH}(\mathrm{avg})$ is defined as the average high pulse width, as calculated across any consecutive 200 high pulses:
tCL(avg) is defined as the average low pulse width, as calculated across any consecutive 200 low pulses:

## Add note for tJIT(duty)

tJIT (duty) is defined as the cumulative set of tCH jitter and tCL jitter. tCH jitter is the largest deviation of any single tCH form $\mathrm{tCH}(\mathrm{avg}) . \mathrm{tCL}$ jitter is the largest deviation of any single tCL from tCL(avg)
tJIT (duty) $=\min / \max$ of $\{\mathrm{tJIT}(\mathrm{CH}), \mathrm{tJIT}(\mathrm{CL})\}$, where:
$\mathrm{tJIT}(\mathrm{CH})=\{\mathrm{tCHi}-\mathrm{tCH}(\mathrm{avg})$ where $\mathrm{i}=1$ to 200$\}, \mathrm{tJIT}(\mathrm{CL})=\{\mathrm{tCLi}-\mathrm{tCL}(\mathrm{avg})$ where $\mathrm{i}=1$ to 200$\}$,

## Add note for tJIT(per), tJIT(per,Ick)

tJIT (per) is defined as the largest deviation of any single tCK from tCK(avg). tJIT(per) = min/max of \{tCKi-tCK(avg) where $\mathrm{i}=1$ to 200$\}$
tJIT (per) defines the single period jitter when the DLL is already locked.
tJIT(per,lck) uses the same definition for single period jitter, during the DLL locking period only.
tJIT(per) and tJIT(per,lck) are not guaranteed through final production testing

Add note for $\mathrm{tJIT}(\mathbf{c c})$, tJIT(cc,lck)
$\mathrm{tJIT}(\mathrm{cc})$ is defined as the absolute difference in clock period between two consecutive clock cycles: $\mathrm{tJIT}(\mathrm{cc})=\mathrm{Max}$ of $\{\mathrm{tCKi}+1-\mathrm{tCKi}\}$
$\mathrm{tJIT}(\mathrm{cc})$ defines the cycle to cycle jitter when the DLL is already locked.
tJIT(cc,lck) uses the same definition for cycle to cycle jitter, during the DLL locking period only.
$\mathrm{tJIT}(\mathrm{cc})$ and $\mathrm{tJIT}(\mathrm{cc}, \mathrm{Ick})$ are not guaranteed through final production testing

## Add note for tERR(nper)

tERR is defined as the cumulative error across $n$ multiple consecutive cycles from tCK(avg). This definition is TBD.

### 12.3 Refresh Parameters by Device Density

| Parameter |  | Symbol | 512 Mb | 1Gb | 2Gb | 4Gb | 8Gb | Units |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| All Bank Refresh to active/refresh cmd time |  | tRFC | 90 | 110 | 160 | 300 | 350 | ns |
| Average periodic refresh interval | tREFI | $0^{\circ} \mathrm{C} \leq \mathrm{T}_{\text {CASE }} \leq 85^{\circ} \mathrm{C}$ | 7.8 | 7.8 | 7.8 | 7.8 | 7.8 | $\mu \mathrm{S}$ |
|  |  | $85^{\circ} \mathrm{C}<\mathrm{T}_{\text {CASE }} \leq 95^{\circ} \mathrm{C}$ | 3.9 | 3.9 | 3.9 | 3.9 | 3.9 | $\mu \mathrm{S}$ |

[ Table 47 ] Refresh parameters by device density

### 12.4 Standard Speed Bins

DDR3 SDRAM Standard Speed Bins include tCK, tRCD, tRP, tRAS and tRC for each corresponding bin.
[ Table 48 ] DDR3-800 Speed Bins

| Speed |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| CL-nRCD-nRP |  |  |  | Units | Note |

## NOTES:

Absolute Specification (TOPER;VDDQ=VDD=1.5V +/- 0.075V);

1. The CL setting and CWL setting result in $\operatorname{tCK}(A V G) . M I N$ and $t C K(A V G) . M A X$ requirements. When making a selection of $t C K(A V G)$, both need to be fulfiled: Requirements from CL setting as well as requirements from CWL setting.
2. $\mathrm{tCK}(\mathrm{AVG})$.MIN limits: Since CAS Latency is not purely analog - data and strobe output are synchronized by the DLL - all possible intermediate frequencies may not be guaranteed. An application should use the next smaller JEDEC standard tCK(AVG) value (2.5, 1.875, 1.5 , or 1.25 ns ) when calculating $C L[n C K]=t A A[n s] / t C K(A V G)[n s]$, rounding up to the next 'Supported CL'.
3. $\mathrm{tCK}(\mathrm{AVG}) . \mathrm{MAX}$ limits: Calculate $\mathrm{tCK}(\mathrm{AVG})=\mathrm{tAA} . M A X / C L S E L E C T E D$ and round the resulting $\mathrm{tCK}(\mathrm{AVG})$ down to the next valid speed bin limit (i.e. 3.3 ns or 2.5 ns or 1.875 ns or 1.25 ns ). This result is tCK(AVG).MAX corresponding to CLSELECTED.
4. 'Reserved' settings are not allowed. User must program a different value.
5. 'Optional' settings allow certain devices in the industry to support this setting, however, it is not a mandatory feature. Refer to supplier's data sheet and SPD information if and how this setting is supported.
6. Any DDR3-1066 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
7. Any DDR3-1333 speed bin also supports functional operation at lower frequencies as shown in the table which are not subject to Production Tests but verified by Design/Characterization.
8. tREFI depends on TOPER

### 13.0 Timing Parameters by Speed Grade

## Jitter Notes

## Specific Note a

When the device is operated with input clock jitter, this parameter needs to be derated by the actual $\operatorname{tERR}$ (mper), act of the input clock, where $2<=m<=$ 12. (output deratings are relative to the SDRAM input clock.)

For example, if the measured jitter into a DDR3-800 SDRAM has tERR(mper),act,min $=-172 \mathrm{ps}$ and tERR(mper),act,max $=+193 \mathrm{ps}$, then $\mathrm{tDQSCK}, \min ($ derated $)=\mathrm{tDQSCK}, \min -\mathrm{tERR}($ mper $)$,act, $\max =-400 \mathrm{ps}-193 \mathrm{ps}=-593 \mathrm{ps}$ and tDQSCK,max(derated) $=\mathrm{tDQSCK}, \max -$ tERR(mper), act, $\min =400 \mathrm{ps}+172 \mathrm{ps}=+572 \mathrm{ps}$. Similarly, tLZ(DQ) for DDR3-800 derates to tLZ(DQ), min(derated) $=-800 \mathrm{ps}-193 \mathrm{ps}=-993 \mathrm{ps}$ and $t L Z(D Q), \max ($ derated $)=400 \mathrm{ps}+172 \mathrm{ps}=+572 \mathrm{ps}$. (Caution on the min/max usage!)
Note that $\operatorname{tERR}$ (mper), act, min is the minimum measured value of $\operatorname{tERR}$ (nper) where $2<=\mathrm{n}<=12$, and $\operatorname{tERR}$ (mper), act, max is the maximum measured value of $\operatorname{tERR}$ (nper) where $2<=\mathrm{n}<=12$

## Specific Note b

When the device is operated with input clock jitter, this parameter needs to be derated by the actual tJIT(per), act of the input clock. (output deratings are relative to the SDRAM input clock.)
For example, if the measured jitter into a DDR3-800 SDRAM has tCK(avg), act $=2500 \mathrm{ps}, \mathrm{tJIT}(\mathrm{per})$,act, $\mathrm{min}=-72 \mathrm{ps}$ and tJIT (per), act, max $=+93 \mathrm{ps}$, then tRPRE, $\min ($ derated $)=$ tRPRE, $\min +\mathrm{tJIT}($ per $)$, act, $\min =0.9 \times \mathrm{tCK}(\mathrm{avg})$, act $+\mathrm{tJIT}($ per $)$, act, $\min =0.9 \times 2500 \mathrm{ps}-72 \mathrm{ps}=+2178 \mathrm{ps}$. Similarly, tQH, min(derated) $=\mathrm{tQH}, \min +\mathrm{tJIT}$ (per), act, $\min =0.38 \times \mathrm{tCK}($ avg $), \mathrm{act}+\mathrm{tJIT}($ per $), \mathrm{act}, \min =0.38 \times 2500 \mathrm{ps}-72 \mathrm{ps}=+878 \mathrm{ps}$. (Caution on the min $/ \mathrm{max}$ usage!)

## Specific Note c

These parameters are measured from a data strobe signal (DQS(L/U), $\overline{\mathrm{DQS}}(\mathrm{L} / \mathrm{U})$ ) crossing to its respective clock signal (CK, $\overline{\mathrm{CK}}$ ) crossing. The spec values are not affected by the amount of clock jitter applied (i.e. tJIT(per), tJIT(cc), etc.), as these are relative to the clock signal crossing.
That is, these parameters should be met whether clock jitter is present or not.

## Specific Note d

These parameters are measured from a data signal (DM(L/U), DQ(L/U)0, DQ(L/U)1, etc.) transition edge to its respective data strobe signal (DQS(L/U), $\overline{\mathrm{DQS}}(\mathrm{L} / \mathrm{U})$ ) crossing.

## Specific Note e

For these parameters, the DDR3 SDRAM device supports tnPARAM [nCK] = RU\{ tPARAM [ns] / tCK(avg) [ns] \}, which is in clock cycles, assuming all input clock jitter specifications are satisfied.
For example, the device will support $\operatorname{tnRP}=R U\{t R P / t C K(a v g)\}$, which is in clock cycles, if all input clock jitter specifications are met. This means: For DDR3-800 6-6-6, of which $t R P=15 \mathrm{~ns}$, the device will support $\operatorname{tnRP}=R U\{t R P / t C K(a v g)\}=6$, as long as the input clock jitter specifications are met, i.e. Precharge command at Tm and Active command at $\mathrm{Tm}+6$ is valid even if ( $\mathrm{Tm}+6-\mathrm{Tm}$ ) is less than 15 ns due to input clock jitter.

## Timing Parameter Notes

1. Actual value dependant upon measurement level definitions which are TBD.
2. Commands requiring a locked DLL are: READ (and RAP) and synchronous ODT commands.
3. The max values are system dependent.
4. WR as programmed in mode register
5. Value must be rounded-up to next higher integer value
6. There is no maximum cycle time limit besides the need to satisfy the refresh interval, tREFI.
7. For definition of RTT turn-on time tAON see "Device Operation"
8. For definition of RTT turn-off time tAOF see "Device Operation".
9. tWR is defined in ns, for calculation of tWRPDEN it is necessary to round up tWR / tCK to the next integer.
10. WR in clock cycles as programmed in MRO
11. The maximum postamble is bound by tHZDQS(max)
12. Output timing deratings are relative to the SDRAM input clock. When the device is operated with input clock jitter, this parameter needs to be derated by TBD
13. Value is only valid for RON34
14. Single ended signal parameter. Refer to chapter <TBD> for definition and measurement method.
15. tREFI depends on TOPER
16. tIS(base) and tIH (base) values are for $1 \mathrm{~V} / \mathrm{ns}$ CMD/ADD single-ended slew rate and $2 \mathrm{~V} / \mathrm{ns} \mathrm{CK}, \overline{\mathrm{CK}}$ differential slew rate, Note for DQ and DM signals, $\operatorname{VREF}(D C)=$ VrefDQ(DC). FOr input only pins except RESET, VRef(DC)=VRefCA(DC).
See "Address/ Command Setup, Hold and Derating" on page 53.
17. tDS(base) and tDH(base) values are for $1 \mathrm{~V} / \mathrm{ns}$ DQ single-ended slew rate and $2 \mathrm{~V} / \mathrm{ns}$ DQS, $\overline{\mathrm{DQS}}$ differential slew rate. Note for DQ and DM signals, $\operatorname{VREF}(D C)=\mathrm{VRefDQ}(\mathrm{DC})$. For input only pins except RESET, VRef(DC)=VRefCA(DC).
See "Data Setup, Hold and Slew Rate Derating" on page 59.
18. Start of internal write transaction is definited as follows ;

For BL8 (fixed by MRS and on-the-fly) : Rising clock edge 4 clock cycles after WL.
For BC4 (on-the-fly) : Rising clock edge 4 clock cycles after WL
For BC4 (fixed by MRS) : Rising clock edge 2 clock cycles after WL
19. The maximum preamble is bound by tLZDQS(max)
20. CKE is allowed to be registered low while operations such as row activation, precharge, autoprecharge or refresh are in progress, but power-down IDD spec will not be applied until finishing those operations.
21. Altough CKE is allowed to be registered LOW after a REFRESH command once TREFPDEN(min) is satisfied, there are cases where additional time such as $\mathrm{tXPDLL}(\min )$ is also required. See "Device Operation".
22. Defined between end of MPR read burst and MRS which reloads MPR or disables MPR function.
23. One ZQCS command can effectively correct a minimum of $0.5 \%$ (ZQCorrection) of RON and RTT impedance error within 64 nCK for all speed bins assuming the maxi-mum sensitivities specified in the 'Output Driver Voltage and Temperature Sensitivity' and 'ODT Voltage and Temperature Sensitivity' tables. The appropriate interval between ZQCS commands can be determined from these tables and other applicationspecific One method for calculating the interval between ZQCS commands, given the temperature (Tdriftrate) and voltage (Vdriftrate) drift rates that the SDRAM is subject to in the application, is illustrated. The interval could be defined by the following formula:

$$
\text { (TSens } \times \frac{\text { ZQCorrection }}{}
$$

where TSens $=\max (\mathrm{dRTTdT}, \mathrm{dRONdTM})$ and VSens $=\max (\mathrm{dRTTdV}, \mathrm{dRONdVM})$ For example, if $\mathrm{TSens}=1.5 \% /{ }^{\circ} \mathrm{C}, \mathrm{VSens}=0.15 \% / \mathrm{mV}, \mathrm{Tdriftrate}=$ $1^{\circ} \mathrm{C} / \mathrm{sec}$ and Vdriftrate $=15 \mathrm{mV} / \mathrm{sec}$, then the interval between ZQCS commands is calculated as:

$$
\frac{0.5}{(1.5 \times 1)+(0.15 \times 15)}=0.133 \approx 128 \mathrm{~ms}
$$

24. $\mathrm{n}=$ from 13 cycles to 50 cycles. This row defines 38 parameters.
25. $\mathrm{tCH}(\mathrm{abs})$ is the absolute instantaneous clock high pulse width, as measured from one rising edge to the following falling edge.
26. $\mathrm{tCL}(\mathrm{abs})$ is the absolute instantaneous clock low pulse width, as measured from one falling edge to the following rising edge.
27. The tIS(base) AC150 specifications are adjusted from the tIS(base) specification by adding an additional 100 ps of derating to accommodate for the lower alternate threshold of 150 mV and another 25 ps to account for the earlier reference point [(175 mv-150 mV)/1 V/ns].

## Address / Command Setup, Hold and Derating:

For all input signals the total tIS (setup time) and tIH (hold time) required is calculated by adding the data sheet tIS(base) and tlH(base) value (see Table 53 ) to the $\Delta \mathrm{tIS}$ and $\Delta \mathrm{tIH}$ derating value (see Table 54) respectively.
Example: tIS (total setup time) $=\operatorname{tIS}$ (base) $+\Delta$ tIS Setup (tIS) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of $\operatorname{VREF}(\mathrm{dc})$ and the first crossing of $\mathrm{VIH}(\mathrm{ac}) m i n$. Setup (tIS) nominal slew rate for a falling signal is defined as
the slew rate between the last crossing of $\operatorname{VREF}(\mathrm{dc})$ and the first crossing of Vil(ac)max. If the actual signal is always earlier than the nominal slew rate line between shaded ' $\operatorname{VREF}(\mathrm{dc})$ to ac region', use nominal slew rate for derating value (see Figure 23). If the actual signal is later than the nominal slew rate line anywhere between shaded ' $\operatorname{VREF}(\mathrm{dc}$ ) to ac region', the slew rate of a tangent line to the actual signal from the ac level to dc level is used for derating value (see Figure 25).
Hold (tlH) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of Vil(dc)max and the first crossing of VREF(dc). Hold ( tIH ) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of Vih(dc)min and the first crossing of VREF(dc). If the actual signal is always later than the nominal slew rate line between shaded 'dc to VREF(dc) region', use nominal slew rate for derating value (see Figure 24). If the actual signal is earlier than the nominal slew rate line anywhere between shaded 'dc to VREF(dc) region', the slew rate of a tangent line to the actual signal from the dc level to VREF(dc) level is used for derating value (see Figure 26).
For a valid transition the input signal has to remain above/below VIH/IL(ac) for some time tVAC (see Table 55).
Although for slow slew rates the total setup time might be negative (i.e. a valid input signal will not have reached VIH/IL(ac) at the time of the rising clock transition) a valid input signal is still required to complete the transition and reach VIH/IL(ac).
For slew rates in between the values listed in Table 54, the derating values may obtained by linear interpolation.
These values are typically not subject to production test. They are verified by design and characterization.

## Data Setup, Hold and Slew Rate Derating:

For all input signals the total tDS (setup time) and tDH (hold time) required is calculated by adding the data sheet tDS(base) and tDH(base) value (see Table 57) to the $\Delta \mathrm{tDS}$ and $\Delta \mathrm{tDH}$ (see Table 58) derating value respectively. Example: tDS (total setup time) $=\mathrm{tDS}$ (base) $+\Delta \mathrm{tDS}$.
Setup (tDS) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of VREF(dc) and the first crossing of VIH(ac)min. Setup (tDS) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of VREF(dc) and the first crossing of VIL(ac)max (see Figure 27). If the actual signal is always earlier than the nominal slew rate line between shaded 'VREF(dc) to ac region', use nominal slew rate for derating value. If the actual signal is later than the nominal slew rate line anywhere
between shaded 'VREF $(\mathrm{dc})$ to ac region', the slew rate of a tangent line to the actual signal from the ac level to dc level is used for derating value (see Figure 29).
Hold (tDH) nominal slew rate for a rising signal is defined as the slew rate between the last crossing of VIL(dc)max and the first crossing of VREF(dc). Hold (tDH) nominal slew rate for a falling signal is defined as the slew rate between the last crossing of VIH(dc)min and the first crossing of VREF(dc) (see Figure 28). If the actual signal is always later than the nominal slew rate line between shaded 'dc level to VREF(dc) region', use nominal slew rate for derating value. If the actual signal is earlier than the nominal slew rate line anywhere between shaded 'dc to VREF(dc) region', the slew rate of a tangent line to the actual signal from the dc level to VREF(dc) level is used for derating value (see Figure 30).

For a valid transition the input signal has to remain above/below VIH/IL(ac) for some time tVAC (see Table 59).
Although for slow slew rates the total setup time might be negative (i.e. a valid input signal will not have reached VIH/IL(ac) at the time of the rising clock transition) a valid input signal is still required to complete the transition and reach VIH/IL(ac).
For slew rates in between the values listed in the tables the derating values may obtained by linear interpolation.
These values are typically not subject to production test. They are verified by design and characterization
