IR Receiver Modules for Remote Control Systems

MECHANICAL DATA

Pinning for TSOP41.., TSOP43.., TSOP45..: 1 = OUT, 2 = GND, 3 = V_S **Pinning for TSOP21.., TSOP23.., TSOP25..:** 1 = OUT, 2 = V_S, 3 = GND

Please see the document "Product Transition Schedule" at <u>www.vishay.com/ir-receiver-modules/</u> for up-to-date info, when this product will be released.

FEATURES

- · Low supply current
- Photo detector and preamplifier in one package
- Internal filter for PCM frequency
- Improved shielding against EMI
- Supply voltage: 2.5 V to 5.5 V
- · Improved immunity against ambient light
- Insensitive to supply voltage ripple and noise
- Compliant to RoHS Directive 2011/65/EU and in accordance to WEEE 2002/96/EC

DESCRIPTION

These products are miniaturized receivers for infrared remote control systems. A PIN diode and a preamplifier are assembled on a lead frame, the epoxy package acts as an IR filter.

The demodulated output signal can directly be decoded by a microprocessor. The main benefit of the TSOP41..., TSOP21.. is the compatibility to all IR remote control data formats. The TSOP43..., TSOP23.. are optimized to better suppress spurious pulses from fluorescent lamps and LCD TVs. The TSOP45..., TSOP25.. have an excellent noise suppression, it is immune against any dimmed LCD backlighting or plasma TVs. AGC3 and AGC5 may also suppress some data signals in case of continuous transmission.

This component has not been qualified according to automotive specifications.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect the device reliability.

SUITABLE DATA FORMAT

These products are designed to suppress spurious output pulses due to noise or disturbance signals. Data and disturbance signals can be distinguished by the devices according to carrier frequency, burst length and envelope duty cycle. The data signal should be close to the band-pass center frequency (e.g. 38 kHz) and fulfill the conditions in the table below.

When a data signal is applied to the IR receiver in the presence of a disturbance signal, the sensitivity of the receiver is reduced to insure that no spurious pulses are present at the output. Some examples of disturbance signals which are suppressed are:

- DC light (e.g. from tungsten bulb or sunlight)
- · Continuous signals at any frequency
- Modulated noise from fluorescent lamps with electronic ballasts (see figure 14 or figure 15)
