## Dimmable, Low Noise, Dual EL Lamp Driver

## Features

- Adjustable output regulation for dimming
- Lamp fade-in/fade-out capability
- Low audible noise
- $180 \mathrm{~V}_{\mathrm{PP}}$ output voltage for higher brightness
- 1.5 V enable input logic high
- Single cell lithium ion compatible
- One miniature inductor to power both lamps
- Separately adjustable lamp and converter frequencies
- Split supply capability
- 16-Lead QFN package

## Applications

- Dual display cellular phones
- Keypad and LCD backlighting
- PDAs
- Handheld wireless communication products
- Global Positioning Systems (GPS)

## General Description

The Supertex HV861 is a low noise, dimmable, high voltage, dual EL Lamp driver designed for driving two electroluminescent (EL) Lamps with a combined area of 5.0 square inches. The input supply voltage range is from 2.5 V to 4.5 V . Enable input logic high can go as low as 1.5 V , which allows logic interface operating from typical 1.8 V supplies. The device is designed to minimize audible noise emitted by the EL Lamps.

The device uses a single inductor and a minimum number of passive components. Using the internal reference voltage,
the regulated output voltage is at a nominal value of 90 V . The EL Lamps will therefore see $\pm 90 \mathrm{~V}$. The two EL Lamps can be turned ON and OFF using two CMOS logic inputs, EN1 and EN2. The driver is disabled when both EN1 and EN2 are at logic low.

The HV861 has two internal oscillators, a switching MOSFET, and two high voltage EL Lamp driver H-bridges. Each driver has its own half bridge common output, COM1 and COM2, which significantly minimizes the DC offset seen by the EL Lamp. The frequency for the switching MOSFET is set by an external resistor connected between the RSW-Osc pin and the supply pin VDD. The EL Lamp driver frequency is set by an external resistor connected between the REL-Osc pin and the VDD pin. An external inductor is connected between the LX and VDD pins or VIN for split supply applications. Depending upon the EL Lamp sizes, a 1.0 nF to 10.0 nF capacitor is connected between the CS and ground.

As the switching MOSFET charges the external inductor and discharges it into the capacitor at CS, the voltage at CS will start to increase. Once the voltage at CS reaches a nominal value of 90 V , the switching MOSFET is turned OFF to conserve power.

EL Lamp dimming can be accomplished by applying a PWM logic signal to the PWM pin. The EL Lamp brightness will be inversely proportional to the PWM duty cycle. The HV861 can also slowly turn the EL Lamp ON/OFF giving a fade ON/ OFF appearance.

## Typical Application Circuit

## Ordering Information

|  | 16-Lead QFN <br> Device <br> $0.00 \times 3.00 \mathrm{~mm}$ body <br> 0.80 mm height (max) <br> 0.50 mm pitch |
| :---: | :---: |
| HV861 | HV861K7-G |

-G indicates package is RoHS compliant ('Green')

Absolute Maximum Ratings

| Parameter | Value |
| :--- | ---: |
| $\mathrm{V}_{\mathrm{DD}}$, supply voltage | -0.5 V to 5.5 V |
| Operating temperature | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |
| Storage temperature | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Power dissipation | 1.6 W |
| $\mathrm{~V}_{\mathrm{CS}}$, output voltage | -0.5 V to +120 V |

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability. All voltages are referenced to device ground.

## Pin Configuration

## Note:

Pads are at the bottom of the package. Center heat slug is at ground potential.

## Product Marking

$Y=$ Last Digit of Year Sealed W = Code for Week Sealed L = Lot Number = "Green" Packaging Package may or may not include the following marks: Si or $\$ 7$ 16-Lead QFN Package

## Thermal Resistance

| Package | $\boldsymbol{\theta}_{\text {ja }}$ |
| :---: | :---: |
| 16 -Lead QFN | $60^{\circ} \mathrm{C} / \mathrm{W}$ |

## Recommended Operating Conditions

## Split Supply Configuration

The HV861 can also be used for handheld devices operating from a battery where a regulated voltage is available. This is shown in Figure 4. The regulated voltage can be used to run the internal logic of the HV861. The amount of current necessary to run the internal logic is $250 \mu \mathrm{~A}$ max. Therefore, the regulated voltage could easily provide the current without being loaded down.

## Enable/Disable Configuration

EL1 and EL2 outputs can be enabled and disabled via a logic control signal on the EN1 and EN2 pins respectively. When EN1 is high/low, the Lamp1 (EL1) will be ON/OFF. When EN2 is high/low, the Lamp2 (EL2) will be ON/OFF. The control signal can be from a microprocessor.

Figure 4: Split Supply and Enable/Disable Configuration

Pin Configuration and External Component Description

| Pin \# | Name | Description |
| :---: | :---: | :---: |
| 1 | REL-Osc | External resistor from REL-Osc to VDD sets the EL frequency. The EL frequency is inversely proportional to the external $\mathrm{R}_{\mathrm{EL}}$ resistor value. Reducing the resistor value by a factor of two will result in increasing the $E L$ frequency by two. $\mathrm{f}_{\mathrm{EL}}=(2.0 \mathrm{M} \Omega \cdot 190 \mathrm{~Hz}) / \mathrm{R}_{\mathrm{EL}}$ |
| 2 | RSW-Osc | External resistor from RSW-Osc to VDD sets the switch converter frequency. The switch converter frequency is inversely proportional to the external $R_{s w}$ resistor value. Reducing the resistor value by a factor of two will result in increasing the switch converter frequency by two. $\mathrm{f}_{\mathrm{sw}}=(825 \mathrm{k} \Omega \cdot 100 \mathrm{kHz}) / \mathrm{R}_{\mathrm{sw}}$ |
| 3 | VDD | Low voltage input supply pin. |
| 4 | EN1 | Enable input signal for EL Lamp 1. CMOS logic input pin. Refer to the function table. |
| 5 | EN2 | Enable input signal for EL Lamp 2. CMOS logic input pin. Refer to the function table. |
| 6 | GND | Device ground. |
| 7 | LX | Drain of internal switching MOSFET. Connection for an external inductor. <br> The inductor LX is used to boost the low input voltage by inductive flyback. When the internal switch is on, the inductor is being charged. When the internal switch is off, the charge stored in the inductor will be transferred to the high voltage capacitor $\mathrm{C}_{\mathrm{s}}$. The energy stored in the capacitor is connected to the internal H-bridge, and therefore to the EL Lamp. In general, smaller value inductors, which can handle more current, are more suitable to drive larger size Lamps. As the inductor value decreases, the switching frequency of the inductor (controlled by $R_{s w}$ ) should be increased to avoid saturation. |
| 8 | CS | Connect a 100 V capacitor between this pin and ground. This capacitor stores the energy transferred from the inductor. |
| 9 | EL2 | EL Lamp 2 connection. |
| 10 | COM2 | Common connection for EL2 Lamp. |
| 11 | COM1 | Common connection for EL1 Lamp. |
| 12 | EL1 | EL Lamp 1 connection. |
| 13 | PWM | PWM pulse input for EL Lamp dimming. The duty cycle of the PWM signal is inversely proportional to the output voltage. If PWM dimming is not desired, then the PWM pin should be tied to ground. |
| 14 | VOUT | Switched internal reference voltage. |
| 15 | VREG | Input voltage to set $\mathrm{V}_{\mathrm{CS}}$ regulation voltage. This pin allows an external voltage source to control the $\mathrm{V}_{\text {cS }}$ amplitude. EL Lamp dimming can be accomplished by varying the input voltage to VREG. The $\mathrm{V}_{\mathrm{cS}}$ voltage is approximately 71 times the voltage seen on VREG. <br> External resistor connected between VREG and VOUT pins controls the $\mathrm{V}_{\mathrm{cs}}$ charging rate. The charging rate is inversely proportional to the resistor value. |
| 16 | VREF | Internal reference voltage to set the regulation voltage. Connect an external capacitor ( $\mathrm{C}_{\text {REF }}$ ) from VREF to ground to slowly brighten the lamp during power-up and dim down the lamp during powerdown. The size of the capacitor determines the time taken to brighten up or dim down. If fade-in and fade-out are not required, this pin should be left floating. Fade in/fade out time $=C_{\text {REF }} \times 210 \times$ $10^{3} \mathrm{sec}$. |

## $3.00 \times 3.00 \mathrm{~mm}$ body, 0.80 mm height (max), 0.50 mm pitch

## Notes:

1. A Pin 1 identifier must be located in the index area indicated. The Pin 1 identifier can be: a molded mark/identifier; an embedded metal marker; or a printed indicator.
2. Depending on the method of manufacturing, a maximum of 0.15 mm pullback (L1) may be present.
3. The inner tip of the lead may be either rounded or square.
